Foreword . . .

LIKE AN IMPORTANT SECTION of a jigsaw puzzle, the record of 1955 represented in this volume falls into place in the larger pattern of world events which has been taking shape since World War II. Basic to this pattern, of course, is the continued cold war struggle between the East and the West—the latter intent in its efforts to build a permanent peace on the foundation of individual freedom and dignity; the former equally intent on its long-established goal of a twentieth century which (in the words of Soviet Deputy Premier Kaganovich) will see “the triumph of socialism and communism.” Between these two giant forces lay the so-called neutralist nations, notably those of the Asian-Arab world, which remained uncommitted to either side, but to win whose favor the USSR has launched a vigorous political and economic propaganda campaign.

Against this background of global conflict of interests, the year's major developments take on added significance. The Geneva “Meeting at the Summit,” which brought together the Big Four heads of government; the Asian-African Conference at Bandung, Indonesia; the Baghdad Pact, creating a defense organization loosely termed the Middle East Treaty Organization; the nationalist struggle in French North Africa; the Arab-Israeli conflict in the Middle East; the attainment of West German sovereignty without all-German unification; preparations for the launching of the first earth satellite; and the illness of President Eisenhower—all these assume a greater importance when viewed against a background of international power politics.

Unhappily the “new spirit” manifested at Geneva, notwithstanding President Eisenhower's dramatic proposals for international aerial inspection and exchange of armaments data, took on more of the aspects of an old and somewhat familiar ghost before the year was out. The sudden vision of a road to universal peace had made it difficult to accept the fact that the Soviet goal had not changed, however much the signposts along the way might have been altered.

For the valued assistance of the editorial and production staffs and well over two thousand contributors of articles, parts of articles, and specific information, whose combined efforts have made possible this thirty-fourth edition of *THE AMERICANA ANNUAL*, the editor wishes to express his most sincere gratitude.

CHRONOLOGY

the events of 1955

French troops search for rebels in the Atlas Mountains countryside of Morocco as native tribesmen launch a series of guerrilla attacks on French settlements in early October 1955.

WIDE WORLD

CHRONOLOGY . . 1955

PART 1 . . The Outstanding Dates of the Year

JANUARY

- 2—President José Antonio Remón of Panama is assassinated in Panama City.
- 6—President Eisenhower, in State of Union message, calls for interparty cooperation to strengthen nation's international role for peace.
- 6-10—U.N. Secretary General Dag Hammarskjöld confers with Chinese Communist Premier Chou En-lai in Peking on release of 11 American fliers held by China as "spies."
- 11—Costa Rican rebels seize northern border town of Villa Quesada; President José Figueres charges Nicaragua with aggression.
- 15—National Assembly of Panama dismisses President José Ramón Guizado for implication in assassination of former President Remón; Ricardo Arias Espinosa sworn in as president.
- 20—Costa Rica and Nicaragua accept Organization of American States plan for buffer zone.
- 25—Some 300 Costa Rican rebels cross into Nicaragua and surrender for internment.
- 29—President Eisenhower signs congressional resolution authorizing him to use armed forces if necessary to defend Formosa and Pescadores.
- 31—U.N. Security Council votes to invite Communist China to take part in talks to end fighting in Formosa Strait area.

FEBRUARY

- 3—Chinese Communist Premier Chou En-lai rejects United Nations bid to discuss cease-fire in Formosa area, stating Nationalists must first be ejected from Security Council.
- 5—French Premier Pierre Mendès-France is ousted by National Assembly on North African policy.
- 8—Soviet Premier Georgi M. Malenkov resigns, accusing himself of errors of leadership; Marshal Nikolai A. Bulganin is elected premier by Supreme Soviet.
- 9—Soviet Premier Bulganin, in inaugural address, stresses Sino-Soviet tie and increased output of heavy industry; Marshal Georgi K. Zhukov named minister of defense.
- U.S. Senate ratifies mutual defense pact with Nationalist China.
- 11—Chinese Nationalists complete evacuation of Tachen Islands with protection of U.S. Seventh Fleet.
- 19—Southeast Asia Collective Defense Treaty (SEATO) comes into effect.
- 23—Edgar Faure confirmed as premier of France.
- 23-25—SEATO Council holds first session in Bangkok, Thailand; creates permanent group of Council representatives and other organs.
- 24—Turkey and Iraq sign five-year mutual defense pact in Baghdad, Iraq.
- 27—Japanese elections result in victory of Premier Ichiro Hatoyama's Democratic Party.
- 28—Israeli forces stage reprisal raid on Egyptian posts in Gaza strip; 38 Egyptians and 8 Israelis killed.

MARCH

- 2—Cambodian King Norodom Sihanouk abdicates in favor of his father, Norodom Suramarit.
- 3—U.S.-Nationalist Chinese defense pact takes effect.
- 16—Yalta Conference documents are released by U.S. State Department.
- 18—Ichiro Hatoyama is re-elected premier of Japan by House of Representatives.
- 24—Canadian Secretary of State for External Affairs Lester B. Pearson states Canada will not take part in conflict over Quemoy and Matsu.
- 27—French Council of the Republic completes parliamentary ratification of 1954 Paris pacts on rearmament of Germany.

APRIL

- 5—Sir Winston Churchill resigns as prime minister of Great Britain.
- 6—Sir Anthony Eden is named prime minister of Great Britain and first lord of Treasury.
- 7—Harold Macmillan named British foreign secretary.
- 12—Salk antipoliomyelitis vaccine is reported successful in 1954 mass trials.
- 15—Austrian and Soviet leaders agree in Moscow on conditions for Austrian State Treaty.
- 18—Albert Einstein dies in Princeton, N.J., aged 76.

- 18-24—Asian-African Conference takes place at Bandung, Indonesia, adopting resolutions on world peace and self-determination of nations.
- 23—Chinese Communist Premier Chou En-lai, at Bandung, Indonesia, says Communist China does not want war with U.S. and is willing to negotiate on Formosa and other Far East issues.
- 29—Giovanni Gronchi, left-wing Christian Democrat, elected president of Italy by Parliament.

MAY

- 2—South Vietnamese army sweeps Binh Xuyen units out of Saigon, after 5 days of heavy fighting.
- 5—Federal Republic of Germany attains sovereignty, as 1954 Paris pacts on West Germany, Western European Union, and Saar come into effect.
- 7—Western European Union comes into being, as foreign ministers of member nations meet in Paris and set up organizational structure.
- 9—West Germany inducted into NATO at North Atlantic Council meeting in Paris.
- 10—U.S., Britain, and France, in notes to USSR, call for conference of Big Four heads of government.
- 13—Gen. Maxwell D. Taylor named to succeed Gen. Matthew B. Ridgway as chief of staff.
- 14—Eight East European Communist-bloc states sign 20-year mutual defense treaty at Warsaw; Soviet Marshal Ivan S. Konev named chief of joint military command.
- 15—Austrian State Treaty is signed in Vienna by foreign ministers of Big Four and Austria.
- 25-27—Tornadoes hit Kansas, Arkansas, Oklahoma, Missouri, and Texas; 121 killed, including 77 in Udall, Kans.
- 26—British elections result in Conservative Party victory. Soviet Premier Bulganin and Communist Party Secretary Khrushchev head Soviet delegation arriving in Belgrade, Yugoslavia; Khrushchev apologizes for Soviet-Yugoslav break of 1948 and calls for renewal of close ties.
- 31—U.S. Supreme Court rules that states must end racial segregation in public schools within "reasonable" time. Communist China "deports" four American fliers shot down in Korean war.

JUNE

- 3—French Premier Faure and Tunisian Premier Tahar ben Ammar sign conventions in Paris on internal autonomy for Tunisia.
- 6—Ford Motor Co. and United Automobile Workers agree on three-year contract including supplemental unemployment benefits.
- 7—USSR invites West German Chancellor Konrad Adenauer to discuss Soviet-West German ties.
- 13-14—Catholic demonstrators and Peronists clash in Buenos Aires; 430 Catholics arrested.
- 16—Navy revolt breaks out in Argentina; Argentine leaders excommunicated by Vatican for acts against Roman Catholic Church.
- 20-26—Tenth anniversary meeting of United Nations takes place in San Francisco.
- 22—Argentine revolt quelled; Gen. Franklin Lucero returns control of armed forces to President Juan D. Perón.
- Italian Premier Mario Scelba and cabinet resign, but remain temporarily as caretaker government.
- 23—Indian Prime Minister Nehru and Soviet Premier Bulganin sign declaration in Moscow calling for ban on nuclear weapons, arms reductions, and satisfaction of Communist China's "legitimate rights" to Formosa.

JULY

- 6—Antonio Segni heads new Italian cabinet.
- 7—North Vietnamese President Ho Chi Minh and Chinese Communist leaders conclude pact in Peking on \$338 million in Chinese economic aid to North Vietnam.
- 11—President Eisenhower orders cancellation of Dixon-Yates power contract.
- U.S. Air Force Academy dedicated near Denver, Colo.
- 14-18—Anti-French rioting in Morocco results in over 60 killed.

- 18—Big Four "Summit Conference" of heads of government opens in Geneva, Switzerland, attended by U.S. President Eisenhower, Soviet Premier Bulganin, British Prime Minister Eden, and French Premier Faure.
- 21—President Eisenhower, at Geneva Conference, proposes that U.S. and USSR exchange blueprints on respective military establishments and that each country be open to aerial inspection by the other; Premier Bulganin calls for nonaggression pact between NATO and Warsaw treaty bloc.
- Seawolf*, second U.S. atomic submarine, is launched at Groton, Conn.
- 23—Geneva Conference adjourns after directing Big Four foreign ministers to meet in October.
- Cordell Hull dies in Bethesda, Md., aged 83.
- 27—Austria regains sovereignty; Allied Council for Austria holds final meeting in Vienna.
- Israeli Constellation airliner is shot down by Bulgarian fighter planes near Greek border; 58 aboard (including 12 Americans) killed.
- Federation of Malaya holds first national elections; Alliance Party victorious.
- 29—White House announces U.S. plans to launch first man-made earth satellite in 1957 or 1958.

AUGUST

- 1—U.S. and Communist China open talks in Geneva; Chinese Representative Wang Ping-nan announces freeing of 11 U.S. airmen held in China as spies.
- 7—Mohammad Ali resigns as prime minister of Pakistan, after losing leadership of Moslem League Party.
- 8-20—First International Conference on the Peaceful Uses of Atomic Energy is held in Geneva, Switzerland.
- 9—South Korean demonstrators try to seize Polish and Czechoslovak members of Neutral Nations Supervisory Commission on Wolsmi Island, but are held off by U.S. guards.
- 10—South Vietnamese Premier Ngo Dinh Diem rejects North Vietnamese request for talks on unified elections.
- 11—Chaudhry Mohammad Ali heads Pakistan cabinet.
- 12—Thomas Mann dies in Zurich, Switzerland, aged 80.
- 13—USSR announces decision to reduce armed forces by 640,000 by December 15.
- 15—Indian nonviolent demonstrators march on Goa and Damão; Portuguese forces kill 22 demonstrators.
- 18-19—Rains accompanying hurricane Diane cause record floods in six Northeastern states; 179 killed; damages estimated at \$457.7 million.
- 19—India severs diplomatic relations with Portugal over Portuguese India dispute.
- 20-21—Revolts in French Morocco and Algeria result in over 2,200 persons killed.
- 31—Japanese Foreign Minister Mamoru Shigemitsu ends three-day talks with U.S. leaders in Washington; joint communiqué calls for build-up of Japanese military strength.
- Israel charges new wave of Arab terrorism along Gaza strip, with 7 Israelis killed; Israelis attack Egyptians at Khan Yunis, killing 40.

SEPTEMBER

- 6—Anti-Greek riots occur in Istanbul and Izmir, Turkey.

- 13—Nationalist China vetoes U.N. membership for Mongolian People's Republic, leading to failure of "package deal" on admission of 18 nations.
- Ford Foundation announces it will grant \$500 million to 4,157 private colleges, universities, and hospitals in next 18 months.
- 14—Sixteen new members (including four of Soviet bloc) elected to U.N., as USSR reverses earlier stand.
- Hugh Gaitskill elected leader of British Labour Party, succeeding Clement R. Attlee.
- 16—U.N. General Assembly approves President Eisenhower's plan on aerial inspection and exchange of military blueprints.
- Syria asks U.N. Security Council to impose economic sanctions against Israel for Sea of Galilee raid of Dec. 11.
- 18—Soviet Premier Bulganin and Afghanistan Premier Mohammed Daud sign protocol in Kabul extending nonaggression pact of 1931; Soviet leaders pledge \$100 million loan to Afghanistan.
- Saar parliamentary elections result in victory of pro-German parties.
- 19—Jordanian cabinet of Hazza al-Majali resigns, following rioting against Jordan's joining Baghdad Pact.
- 20—Selwyn Lloyd replaces Harold Macmillan as British foreign secretary in cabinet reorganization.
- Yugoslavia elected to U.N. Security Council, in compromise arrangement on split-term with Philippines; U.N. General Assembly adjourns.
- 22-26—Floods hit California, Nevada, and southern Oregon; 74 persons killed.
- 29—Soviet Premier Bulganin and Communist Party Secretary Khrushchev, in Moscow addresses, attack Western "colonialism"; Khrushchev criticizes President Eisenhower's plan on aerial inspection.

PART 2 . . Chronological Index of the Year's Events

ON the following pages are indexed the principal world events of 1955. Main subject headings are indexed in alphabetical order, while specific events under each subject heading are listed chronologically (in order of their occurrence). Articles on many of the persons, countries, and subjects may be found in the main text of this volume.

The Chronological Index is intended primarily to aid the reader in finding the dates on which the most important events of 1955 occurred. It is, therefore, a selected list of the year's most significant events, rather than a complete list of all events under all subject headings, though it does serve also as a guide to the year's important developments in any subject, particularly in the major countries.

In many instances events have been listed under both the general subject classification headings, and under the specific names of the events or persons concerned; for example, the Geneva Conference of the Big Four heads of government (July 18-23) may be found under the headings BULGANIN, EDEN, EISENHOWER, and FAURE, as well as under GENEVA CONFERENCE, FRANCE, GREAT BRITAIN, UNION OF SOVIET SOCIALIST REPUBLICS, and UNITED STATES. In other instances, events concerning persons whose names are less familiar to most readers may be found under the name of the country or general subject involved. United States diplomatic and other appointments are listed under the heading UNITED STATES. Cross-references used herein refer only to headings within this Index.

ACCIDENTS AND DISASTERS

Aviation

Belgian DC-6 crashes in mountains 50 miles north-east of Rome, Italy; 29 killed, **Feb. 13**
TWA Skyliner crashes on mountain peak near Albuquerque, N. Mex.; 16 killed, **Feb. 19**

U.S. AIR FORCE

THE AMERICANA ANNUAL 1956

BRASIVES. Various natural minerals and a few synthetic products are used for grinding and polishing. United States production and imports of the more important of these are shown in the accompanying table.

ABRASIVES IN THE UNITED STATES
(In short tons, unless otherwise indicated)

Type and category	1952	1953	1954
NATURAL:			
Grinding and polish- ing sand	1,229,794	1,492,348	
Quartz (crude, crushed, and ground)	246,604	241,723	
Garnet	11,390	10,520	14,183
Emery	10,352	10,562	9,758
Tripoli	35,459	36,183	
Pumice (abrasive only)	22,429	22,988	16,397
Grindstones	3,962	2,499	2,218
Tube-mill liners	1,083	1,219	933
Grinding pebbles	3,400	2,472	3,070
MANUFACTURED*:			
Silicon carbide	91,531	62,301	66,972
Aluminum oxide	180,375	244,136	219,308
Metallic abrasives	157,034	160,500	118,096
IMPORTS:			
Industrial diamonds (carats)	13,705,258	13,522,676	13,988,762
Corundum	4,571	2,675	1,108
Emery			557
Pumice	22,464	33,655	21,901
Silicon carbide	50,684	46,294	38,935
Aluminum oxide	133,276	239,722	184,177

ACADEMIES AND ASSOCIATIONS. See SOCIETIES AND ORGANIZATIONS.

ACCIDENTS. Accidents, the leading cause of death among persons 1 to 35 years of age, continued to be the fourth most important cause of death in the United States, exceeded only by heart disease, cancer, and cerebral hemorrhage.

Accidental deaths during the first seven months of 1955 totaled 51,100, only 200 fewer than in the corresponding months of 1954. A 4% increase in motor vehicle deaths was offset by reductions in home and public accident deaths.

The 1954 accidental death toll in the United States was approximately 90,000, an average of 55.8 persons killed per 100,000. This is the lowest rate in the nation's history, and the first time it has been below 60.

There were 8,642 accidental deaths in Canada in 1953 (the latest year for which complete figures are available). The population death rate was 58.6 for every 100,000 persons. As in the United States, accidents in Canada ranked fourth among all causes of death. Motor vehicle accidents were the most important type in Canada in 1953, resulting in 3,121 deaths, followed by falls (1,469), drownings (1,202), burns (477), railroad accidents (313), and poison gases (194).

The distribution was similar in the United States, except for a higher proportion of motor vehicle deaths and a lower proportion of deaths by drowning. There the 1954 accidental death

Photo Above: Two Adélie penguins overlook a part of the Antarctic coastline, as if to welcome the numerous expeditions which will visit that continent in 1956-57.

AUSTRALIAN NEWS & INFORMATION BUREAU

totals by classes were: motor vehicle, 36,000; home, 27,500; public non-motor vehicle, 15,500; and work, 14,000. In addition to deaths, accidental injuries totaled 9,050,000, including about 330,000 which resulted in some degree of permanent impairment.

Accidental deaths and injuries are estimated to have cost the United States \$9.8 billion in 1954. These costs include wage losses, medical and hospital expenses, overhead costs of insurance, property damage in motor vehicle accidents, property destroyed by fire, and property destroyed or production lost due to work accidents.

ACCIDENTAL DEATHS IN THE U.S., 1945-55

Year	Total ¹	Motor vehicle	Public non-motor vehicle	Home	Work
1945	95,918	28,076	16,000	33,500	16,500
1946	98,033	33,411	17,500	33,000	16,500
1947	99,579	32,697	18,000	34,500	17,000
1948* (5th revn.)	98,001	32,259	17,000	35,000	16,000
1948* (6th revn.)	93,000	32,259	16,000	31,000	16,000
1949	90,106	31,701	15,000	31,000	15,000
1950	91,249	34,763	15,000	29,000	15,500
1951	95,871	36,996	16,000	30,000	16,000
1952	96,172	37,794	16,000	30,500	15,000
1953	95,032	37,955	16,000	29,500	15,000
1954	90,000	36,000	15,500	27,500	14,000
1954 (Jan.-July)	51,300	19,150	9,600	16,300	7,900
1955 (Jan.-July)	51,100	19,840	9,500	15,600	7,900

¹ Duplications between motor vehicle, work, and home accidents are eliminated in the "Total" column. For the war year 1945, accidental deaths of military personnel are included only in the "Total" and "Motor vehicle" columns. For other years deaths of military personnel are assigned to motor vehicle, public non-motor vehicle, and home accidents, according to the type of accident. ² The first figures for 1948 are comparable with those for earlier years; the second, with later years. The differences between the two sets of 1948 figures reflect changes made in the official methods of death classification.

Source: Total deaths and motor vehicle deaths, 1945 to 1948 (5th revn.), and 1949 to 1953 are National Office of Vital Statistics totals. All other figures are National Safety Council estimates based on data from the National Office of Vital Statistics, state and city health departments and traffic authorities, and other sources.

The motor vehicle accident problem grew more acute as travel mileage continued to rise. A feature of the 1954 efforts to control the traffic death toll was S-D Day (Safe Driving Day), sponsored by President Eisenhower and the President's Committee for Traffic Safety. The aim was to hold traffic deaths to a minimum for one day—December 15. The program resulted in a death toll about 18% less than the normal expected toll, which, if that percentage reduction had prevailed throughout 1954, would have saved about 6,000 lives.

Activities of the National Safety Council and its affiliated state and community organizations continued to expand in 1955, especially in field service and traffic work. Industry, school, government, and private agencies also gave an increasing emphasis to safety.

Grand awards in the National Traffic Safety Contest went to Washington among the states, and to Wausau, Wis., among the cities.

The 42d National Safety Congress, held in October in Chicago, was attended by some 12,000 delegates from all parts of the United States and Canada. Two hundred sessions in five days covered the entire field of safety.

(See also the Index entries, *Accidents* and *Safety*, and the list of accidents and disasters in the CHRONOLOGY at the front of this volume.)

M. E. HORNER,

Director of News, National Safety Council.

ACOUSTICS. See Index entry, *Sound*.

ADAMS, Sherman, American public official: b. East Dover, Vt., Jan. 8, 1899. A former executive of the Parker-Young (lumber) Company, he entered politics in 1940 when he was elected as a Republican to the New Hampshire House of Representatives. Subsequently he served a term in the U.S. House of Representatives (1945-46) and two terms as governor of New Hampshire (1949-52). One of the initial supporters of Gen. Dwight D. Eisenhower, and later his personal campaign manager, Adams was named to the important and influential post of assistant to the president on Nov. 24, 1952.

In this capacity, Adams has played a major role in organizing the administration, hiring its top personnel, and shaping its domestic policy. Shortly after President Eisenhower's heart attack on Sept. 24, 1955, Adams established headquarters at Lowry Air Force Base in Denver, Colo., where he took on the responsibility of reviewing presidential business and deciding what was to be referred to the president's immediate attention. During the first days of President Eisenhower's illness, he and other top officials of the administration decided that it would not be necessary, because of Eisenhower's rapid recovery, to delegate the president's powers.

ADEN. See *ARABIA*.

ADENAUER, Konrad, chancellor of the Federal Republic of Germany: b. Cologne, Germany, Jan. 6, 1876. His political career, which began in 1906, was interrupted in 1933 when the Nazis barred him from political activity. Returning to politics in the post-World War II period as leader of the Christian Democrats, Adenauer became chancellor on Sept. 15, 1949, was re-elected in 1953, and from 1951 to June 6, 1955, also served as foreign minister.

Under his leadership in 1955, parliamentary ratification of the Paris agreements was completed on March 18, leading to West Germany's achievement of sovereignty on May 5 and to her membership in the Western European Union (May 7) and the North Atlantic Treaty Organization (May 9).

Adenauer visited the United States on June 13-18, and stated in Washington, D.C., that West Germany would remain allied with the free world as a means of working toward European security and the unification of East and West Germany. He conferred with President Eisenhower on June 14, and on June 16 received an honorary doctorate of laws from Harvard University. On September 9-13 he headed a German delegation to Moscow, where discussions with Soviet leaders produced agreements for the establishment of West German-Soviet diplomatic relations and for the release of Soviet-held German prisoners of war. (See also *GERMANY*.)

ADLER, Julius Ochs, American newspaper executive and army officer: b. Chattanooga, Tenn., Dec. 3, 1892; d. New York, N.Y., Oct. 3, 1955. As an executive of the *New York Times*, he played an important part in establishing it as one of the foremost newspapers in the world. He also served with distinction in the U.S. Army during both World War I and II.

The nephew of Adolph S. Ochs, former publisher of the *New York Times* and the *Chattanooga Times*, Julius Ochs Adler was graduated from Princeton University (B.A. 1914). He joined the staff of the *New York Times* in 1914, but interrupted his business career for military service. Commissioned a 2d lieutenant in April

1917, he was subsequently promoted to captain and assigned to the 306th Infantry Regiment of the 77th Division, with which he saw action in the Lorraine, Vesle, Aisne, and Meuse-Argonne sectors. He won the Distinguished Service Cross for heroism in the latter campaign.

On his return to the United States in 1919 he was named vice president and treasurer of the *New York Times*, in which capacities he handled the business and mechanical affairs of the newspaper. Having retained a commission in the Organized Reserve Corps, he commanded the 306th Regiment from 1924 to 1940. With the death of Adolph Ochs in 1935, he became general manager of the *New York Times* and publisher of the *Chattanooga Times*.

In 1940, after the outbreak of hostilities in Europe, Adler took a leave of absence from his newspaper duties to return to active service. In July 1941 he was promoted to brigadier general, and in September was appointed assistant commander of the 6th Infantry Division, which in 1943 was assigned the defense of Oahu, Hawaii. In January 1944 he was sent with the division into the Southwest Pacific, and saw action in the New Guinea and Papuan campaigns. In November 1944 he left active service and resumed his newspaper activities.

General Adler continued to pursue his military interests into the postwar period. In 1946 he was appointed commander of the reactivated 77th Division, U.S. Army Reserve, and in 1948, was promoted to the rank of major general. After his retirement from the Reserves on Dec. 31, 1954, he continued to serve as chairman of the National Security Training Commission, a post to which he was appointed by President Dwight D. Eisenhower in 1953.

ADULT EDUCATION. See Index entry.

ADVERTISING. The trend in advertising during 1955 followed, as it usually does, the pattern of American business generally. Record sales were recorded by many companies during 1955 as business activity reached an all-time high, and advertising also exceeded all previous volume records.

The total investment in national advertising reached a new high of something more than \$9 billion, or about 12% over the 1954 level of a little more than \$8 billion. The total investment in measurable national advertising reached a new level, too, of about \$2.6 billion, a 13% increase over 1954's total of some \$2.3 billion. Most of this gain can be attributed not to an increase in advertising volume but rather to higher advertising rates and costs.

Advertising expenditures have been rising steadily since the years prior to World War II, and the rate of increase is shown in the accompanying table taken from the *Tide* Advertising Index which covers the period from 1941 through 1955. The index points are the average for each year with a base of 100 for the 1947-49 average.

1941.....	46.8	1946.....	84.1	1951.....	126.4
1942.....	46.7	1947.....	96.8	1952.....	137.8
1943.....	59.7	1948.....	100.5	1953.....	154.6
1944.....	69.5	1949.....	103.9	1954.....	161.0
1945.....	75.0	1950.....	113.1	1955.....	181.5*

* Estimated

Advertising agencies had one of their most successful years in 1955, although their remuneration system (which has been under debate for many years) became the subject of a government antitrust suit. Early in 1955 the Justice Department filed the suit against the American Associa-

tion of Advertising Agencies, the American Newspaper Publishers Association, and four other media associations charging conspiracy to fix agency commissions at 15%. Another phase of the suit charged conspiracy by the defendants to "recognize" certain agencies to the exclusion of others. Although the six associations involved indicated their determination to fight the suit through the courts, several postponements in 1955 meant that any action on the suit would not take place before 1956.

Several trends continued to affect advertising agencies in 1955. Continually rising costs forced more small and medium-sized agencies to go out of business or to merge with other agencies. And demands by advertisers for more marketing services (such as public relations, market research, packaging, etc.) forced many agencies to expand their facilities in order to provide these services.

Network television naturally accounted for the biggest increase in advertising expenditures in 1955 because of higher rates, more TV stations coming on the air, more people buying TV sets, and more advertisers using the medium for the first time. Expenditures in network TV in 1955 reached \$418 million, an increase of almost 31% over 1954's total volume of \$320 million. National spot television also enjoyed a record year with billings of an estimated \$236 million, compared with \$177 million in 1954.

Color television moved ahead in 1955, its biggest gains coming through an increased amount of color TV programming. Color television audiences were still comparatively small in 1955 due to the high cost of color TV sets.

All other media but one recorded volume gains in 1955. National magazines reached an estimated \$660 million, compared with \$604 million in 1954, a 9% increase in revenue. Ad pages climbed 4% in 1955, from 81,000 to 84,300.

National advertising in newspapers came to about \$690 million in 1955, compared with \$594 million in 1954. The bulk of this increase was due to gains in automotive and general classifications; a 3% increase in newspaper rates and more use of color advertising in newspapers also helped account for the volume rise.

The one medium which lost ground in 1955 was network radio, which fell about 17% behind 1954 in dollar volume.

Outdoor advertising climbed from \$112 million in 1954 to an estimated \$115 million in 1955. Transportation advertising also recorded a slight gain to \$20.3 million. Business publications received about \$390 million in revenue in 1955, compared with \$365.5 million in 1954. Direct mail volume also showed an increase from \$1 billion to about \$1.27 billion. Point-of-purchase advertising was also up, probably to slightly more than \$1 billion.

ALVIN W. OUTCALT,
Assistant Editor, "*Tide*" Magazine.

AERONAUTICS. "Pinch-Waisted" Design.—A revolutionary aerodynamic discovery which has resulted in increases of up to 25 per cent in the speed of supersonic aircraft was announced on Sept. 11, 1955, by the National Advisory Committee for Aeronautics after three years of secrecy. The so-called area rule concept of aircraft design was developed by Richard T. Whitcomb, a 34-year-old scientist at the Langley Aeronautical Laboratory of the NACA.

One of the handicaps to increased speed has been the very high power required to offset the very high drag encountered when a plane passes

through the transonic region. In applying area rule, the designer considers the total cross-sectional area of wings, fuselage, tail surfaces, and other parts of the airplane, rather than that of the fuselage alone, and develops a configuration having greatly reduced drag rise in the transonic regime of flight. The result, in terms of design, is essentially an indented fuselage in the region of the wing, and is known as the "pinch-waisted" design.

The new principle has contributed greatly to the increased performance of the air force Convair F102-A delta-wing all-weather interceptor, and the navy Grumman F11F-1 Tiger carrier-based interceptor. It also has been applied to the design of the navy Chance Vought F8U-1 interceptor, which is to be produced in quantity.

Wind tunnel tests of the original F-102 configuration showed reason for doubt that the plane would be able to attain supersonic speeds. After the area rule principle was applied, the F-102 easily passed a speed of Mach 1 (equal to the speed of sound). In the case of the Grumman F11F-1, area rule came into being early enough in the design to be used effectively in the first prototype.

Vertical Take-off Aircraft.—Two extremes were achieved in 1955 in the field of vertically rising aircraft—one a convertiplane which can take off and land vertically, and fly forward as a conventional airplane; and the other a one-man "flying platform" without wings and tail, which can dart up and down and move in level flight in any direction.

At least three convertiplanes were unveiled to some degree during the year—one by the

Transcendental Aircraft Corporation of Glen Ridge, Pa.; the second by McDonnell Aircraft Corporation of St. Louis, Mo.; and the third by the Bell Aircraft Corporation at its Hurst plant near Fort Worth, Texas. The Bell XV-3 is 30 feet long and 13 feet high, with a wing span of 30 feet. Three-bladed rotor propellers are mounted near the tips of the short-span fixed wings, and during the regime of take-off and landing they act as helicopter rotors. For forward speeds these rotor propellers can be rotated 90 degrees for cruising and high-speed flight.

The one-man "puddle jumper" was a flying platform for one person, developed by Hiller Helicopters for the Office of Naval Research. This machine, which has been described as a "flying manhole cover," is really a platform retaining two contra-rotating ducted fans driven by two engines developing less than 100 hp. It is about 6 feet in diameter and 30 inches high, with a guard rail inside of which the pilot stands. Vertical flight is accomplished by giving gas to the engines through a throttle device. Directional motion is accomplished by the pilot's leaning in the desired direction of flight. At about the same time that the Hiller machine was announced came news of a somewhat similar device called the "helivector," powered by a marine outboard motor, and produced by the De Lachner Aircraft Co. of Mount Vernon, N.Y.

Military Aircraft.—Exhaustive laboratory tests accelerated the flight test program of the Douglas C-133 turboprop-powered cargo plane, which was scheduled for production late in 1955. The power plant for this new military cargo carrier is the Pratt & Whitney T-34. Among the tests

Bell XV-3 convertiplane (l.); Hiller "flying platform" (r.); and U.S. Navy's Martin Seamaster XP6M-1 (bottom).

BELL AIRCRAFT; U.S. NAVY; GLEN L. MARTIN CO.

planned is an underwater pressurization study of the fuselage, which measures 130 feet in length, 24 feet in height, and 30 feet in width. These tests will be conducted in the company's new \$6 million laboratory at the Long Beach, Calif., division.

Also under test in the same laboratory will be the B-66 bomber series. This and other planes and their components will be tested under temperature conditions ranging from -100°F. to $+500^{\circ}\text{F.}$ The power plant of the B-66, the Allison J-71 engine, also will be subjected to rigid cooling tests to determine the correct configuration and materials for an optimum performance with a minimum loss of engine power.

The electrical systems of both the C-133 and B-56 will be subjected to a number of tests to determine whether or not they will operate under the wide range of conditions required by these aircraft.

In the fall of 1955, the first official pictures of the huge Martin P6M SeaMaster flying boat were released by the U.S. Navy. The P6M has a wing span of 100 feet, a length of 134 feet, and a height of 31 feet. Its wing area is 1,900 square feet. It is characterized by its high tail and pronounced wing cathedral. Other features are plastic wing tip floats, hydroflaps on both sides of the hull afterbody, and fuel tanks sealed within the wings. (See also AIR FORCE, U.S.; NAVAL AFFAIRS.)

U.S. Commercial Air Traffic.—During the first six months of 1955 the United States scheduled airline industry doubled its profits (\$39,758,000), compared with those earned in the same period a year earlier (\$19,868,000), according to figures furnished by the Air Transport Association of America. The bulk of the business was credited to passenger traffic, which increased 19.4 per cent to a total of 11,630,366,000 revenue passenger-miles flown from January through June 1955. Industry gross revenues totaled \$779,640,000, or a 15 per cent gain over the comparable period of 1954. Estimates for the full year 1955 showed revenues exceeding \$1 billion, net operating income of more than \$100 million, and profits of \$75 million for the domestic scheduled airlines.

SCHEDULED TRAFFIC OF U.S. AIRLINES

	Jan.-Sept. 1954	Jan.-Sept. 1955
DOMESTIC TRUNK AIRLINES:		
Revenue passenger-miles.....	10,991,097,000	13,169,839,000
Revenue plane-miles.....	359,400,800	463,466,125
Freight ton-miles.....	88,736,802	111,079,391
Mail ton-miles.....	51,211,230	55,966,192
Express ton-miles.....	24,794,285	30,612,188
Total revenue ton-miles.....	1,235,863,853	1,482,726,516
U.S.-FLAG INTERNATIONAL AIRLINES:		
Revenue passenger-miles.....	2,486,681,000	2,965,408,000
Revenue plane-miles.....	76,118,356	84,819,912
Freight ton-miles.....	51,836,629	56,298,662
Mail ton-miles.....	20,729,247	32,779,693
Foreign mail ton-miles.....	4,622,624	4,951,135
Express ton-miles.....	142,961	149,786
Total revenue ton-miles.....	335,257,568	398,281,272

(Source: Air Transport Association of America.)

Transatlantic air traffic reached a new peak during the summer of 1955. Approximately 150,000 passengers made return flights over the various routes, and an additional 35,000 made air charter trips. Approximately one half of the scheduled air traffic was carried by two airlines, Pan American World Airways and Trans-World Airlines. The remainder was handled by the scheduled foreign carriers. The increase is due in a large measure to the conversion of airline capacity to tourist or second-class services. The

combination of low-rate tourist fares, a time-payment plan, and the economic prosperity of the United States were the chief contributing factors.

Traffic on United States domestic and international lines in the first nine months of 1955, as compared with the corresponding period of 1954, is shown in the accompanying table.

Re-equipment of U.S. Airlines.—A \$357 million re-equipment program, including 45 jet-powered airliners accounting for \$269 million, was announced on Oct. 13, 1955, by Pan American World Airways. The remaining \$88 million was for 33 Douglas DC-7C piston-engine-powered transports. The jet plane order is shared by the Douglas Aircraft Company of Santa Monica, Calif., and the Boeing Airplane Company of Seattle, Wash., and includes 20 Boeing 707 and 25 Douglas DC-8 airliners. Engines for both jet-powered planes will be of Pratt & Whitney design, rated at more than 10,000 pounds thrust* each; they will be advanced versions of the J-57's in the prototype.

When this equipment goes into service, beginning in 1958, flying time between principal cities of the world will be cut approximately in half. For example, New York to Paris (now 11 hours) will be 6 hours 35 minutes; Chicago to London (now 16 hours) will be 6 hours 45 minutes; San Francisco to Tokyo (now 25 hours) will be cut to 12 hours 45 minutes; and New York to Buenos Aires (now 23 hours) will be 11 hours 15 minutes. Since these airplanes traveling westbound approach more nearly the speed of the earth's rotation than ever before, passengers leaving London at noon London time will arrive in New York at 2:15 P.M., New York time, because of the 5-hour time difference between London and New York; the actual flying time will be 7 hours, 15 minutes.

The Douglas DC-8 has a span of 138.6 feet, a length of 140.6 feet, and an overall height of 40.2 feet; it will carry 130 or more passengers at a gross weight of 257,000 pounds while cruising at 575 mph. for a nonstop distance of 5,000 miles. Somewhat smaller, but having the same performance, the Boeing 707 will have a gross weight of 230,000 pounds, and will have a wing span of 130 feet 10 inches, and a length of 134 feet 6 inches.

Since these planes will normally operate at altitudes above 30,000 feet, they will be above most of the bad weather. This feature, added to the greatly reduced vibration of jets as compared with piston engines, will usher in a new era of comfort for air travel.

It is expected that other operators will follow Pan American in putting these two new jet-powered planes into service. United Airlines has announced its intention to order 30 Douglas DC-8 jet planes costing \$175 million. Eastern Airlines has said it will buy 20 jet-powered transports, as part of a \$350 million expansion program, but has not decided on the specific types. National Airlines is reported to have placed an order for 8 such aircraft, contingent on the receipt of larger orders (such as that of Pan American) which are needed to absorb the higher development cost. American Airlines announced in November that it had ordered 30 Boeing 707's for delivery beginning in March 1959.

Before the jet portion of Eastern Airlines' five-year expansion program has been realized,

* One pound of thrust equals one horsepower at a speed of 375 mph. As speeds increase above 375 mph., the equivalent horsepower increases.

the company announced orders for 40 DC-7B's (of which 8 had been delivered by early November 1955) and 10 Lockheed 1049-G's (Super-G Constellations). These, together with present equipment, will bridge the gap to jet speeds. The Super-G's are planned for use on the new Eastern-Braniff interchange service between New York and South America. These additions to EAL's "transition fleet" will have cost \$125 million by 1958.

Step two in Eastern's program will be the introduction of Lockheed Electras as the new first-class plane on main trunk routes. EAL's original order of 40 Electras will cost about \$100 million and makes Eastern the second United States airline to contract for turboprop passenger transports. In June, American Airlines announced its contract for 35 Electras (to be delivered in 1958-59), at a cost of \$65 million. The first of the 66-passenger Electras, capable of speeds "well in excess of 400 miles per hour," will be delivered to EAL in August 1958. Deliveries will be gradually stepped up to the rate of five per month with completion of the order due for July 1959. If the option for 30 additional Electras is exercised, deliveries will begin in August 1959, continue at a rate of two per month through March 1960, and three per month until completion in November 1960.

With a power plant estimated to generate 3,750-hp., the Eastern Electra would weigh 98,500 pounds and would have a range of 2,000 miles. In addition to its 66 passengers, the plane will have a six-place luxury lounge. By removal of the galley and other fittings used for first-class service, the plane could have a capacity of 91 passengers as a coach-class aircraft. When the first 40 Electras are added, Eastern's 1959 fleet will total 198 planes with a capacity of 10½ billion seat-miles annually, or 90 per cent more than at present. Four-engine piston-powered planes will be converted to coach service as replaced by the new turboprops.

During the fall of 1955, orders for the new Convair 440 Metropolitan airliner passed the \$11 million mark when Scandinavian Airlines ordered 11, in addition to the 2 ordered by Real, S.A. Transportes Aereos of Brazil, and one by Aero O/Y Finnair. Real Transportes will take another two 52-passenger Metropolitans as substitutes for two Model 340's ordered earlier in 1955. Continental Air Lines will do the same, taking 44-passenger 440's instead of three 340B's.

Convair's Model 440 will be powered by two Pratt & Whitney Aircraft R2800 piston engines with new cylinder baffles and cylinder head deflectors for improved performance, particularly during climbs. The use of jet engines for additional wing-tip power is being considered for U.S. Air Force versions of the Convair transport. The maximum range of the new transport is given as 1,310 miles with no wind, a 1,500-pound fuel reserve under cruise operation at 20,000 feet, and a maximum take-off weight of 49,100 pounds. This compares with a range of 1,150 miles for the Model 340. The 52-passenger version of the 440 will have a range of nearly 1,000 miles under the same flight conditions.

Canada.—The Canadian Air Transport Board has approved the trade by Trans-Canada Air Lines (TCA) with Canadian Pacific Air Lines (CPA) of the former's Montreal-Mexico City route for two domestic routes—one between Montreal, Quebec City, and Seven Islands; and the other between Montreal, Rouyn, Noranda, and Toronto. In addition, Canadian Pacific is

turning over its service from Quebec City to Baie Comeau and Forestville to Quebecair Ltd.

CPA's Toronto-Mexico City nonstop route will complement its Vancouver-Mexico City nonstop route, and will provide the line's only service in eastern Canada. TCA in the exchange gets a section of the transcontinental Canadian route which will probably be extended from Seven Islands to St. John's, Newfoundland, to tie in with its transatlantic services. TCA will continue to operate its Toronto-Tampa nonstop route and its services to the Caribbean area.

Trans-Canada Air Lines operations in the first nine months of 1955, as compared with the corresponding period of 1954, were as follows:

	Jan.-Sept. 1954	Jan.-Sept. 1955
Route miles.....	22,445	22,314
Revenue passenger-miles.....	651,587,645	730,280,226
Revenue plane-miles.....	23,423,888	25,545,992
Mail ton-miles.....	4,895,707	5,437,393
Express ton-miles.....	1,252,624	1,558,136
Freight ton-miles.....	5,781,806	7,125,550

Great Britain.—Progress in turbine engine design was evident at the 16th Annual Display of the Society of British Aircraft Constructors at Farnborough, Sept. 5-11, 1955, where 18 aircraft and engines were given their first public showing.

Armstrong Siddeley Motors Ltd. has developed its Sapphire turbojet to a thrust well above the initial type-test rating of 10,200 pounds on the ASSA-7. Later versions of the Sapphire are said to be almost complete redesigns of current series, and feature more airflow capacity for greater thrust.

Late models of the Viper, a simple turbojet, are approaching high thrust-weight ratios of about 3:6. The newest type-tested Viper is the ASV-8, rated at 1,750 pounds thrust for a dry weight of less than 500 pounds. The developed ASV-10 gives 2,300 pounds thrust without afterburner, and the ASV-7R gives 2,400 pounds thrust, also without afterburner.

Armstrong Siddeley shares with de Havilland the small-size rocket engine development. Engines thus far announced have been the Snarler and the Screamer, but these have been supplanted by later designs.

The Olympus engine has been type-tested in one modification at 11,000 pounds thrust; newer versions of the Olympus—the BO1.6 and the BO1.11—are rated considerably higher, with 16,000 pounds thrust as the reported rating for one of them. Now used in the Vulcan, the Olympus is scheduled to go into the redesigned Javelin in a developed form with higher thrust.

A new Bristol engine called the Zeus, with a design thrust starting near the 20,000-pound mark, has been reported. Two novel concepts at Bristol are the BE-25 supercharged turboprop and the lightweight Orpheus turbojet. The BE-25 has not yet been in operation, but many of its components have. Its compressor is aerodynamically identical to that of the Orpheus. Bristol has aimed the BE-25 at the civil turboprop transport market; it is in direct competition there with the Rolls RB-109 and the Napier Elands future developments. The Orpheus made its first flight in the Folland Gnat fighter in July 1955. Its combustion chambers have a life of 800 hours at this early stage of the program. Bristol expected to qualify the Orpheus at its guaranteed rating of 4,850 pounds thrust by the end of 1955. The engine installed in the Gnat currently is rated at less than 4,000 pounds thrust.

Also at the Farnborough display, a new and revolutionary development in jet aerodynamics

was demonstrated. Although it is still in the laboratory stage, the jet flap promises increased performance for jet power plants by ejecting the whole thrust of the engine through a trailing edge slat. The resulting sheet of air is forced down at a 60-degree angle, giving an upward reaction plus a forward suction component greater than the normal horizontal jet thrust. The elevator of the conventional airplane is replaced by this jet sheet, and the angle can be varied from 60 degrees to zero, giving a lift coefficient ranging from 11.0 for take-off and landing to 1.0 for level flight. The idea, which originated in the National Gas Turbine Establishment, would result in greatly reduced requirements for runway length in landings and take-offs.

Germany.—One of the most famous airlines in pre-World War II history was the German line, Lufthansa. The revived Lufthansa (Deutsche Lufthansa Aktiengesellschaft) resumed domestic flights in Germany on April 1, 1955, and international flights (to London and Madrid) on May 15. On June 9 it completed its first postwar transatlantic flight, from Hamburg to New York, using a United States-built Lockheed Super-G Constellation. At that time Lufthansa had taken delivery of four of these planes, and had four more on order. The West German flight crews are being trained by Lockheed and United States airlines personnel.

USSR.—Soviet military aircraft have been given code designations by the United States for identification purposes. Most important of the planes demonstrated at the May Day and Soviet Aviation Day (July 3) shows in 1955 were the following: the Bison, or Type 37 (a four-jet intercontinental bomber, corresponding to the Boeing B-52); the Badger, or Type 39 (a twin-jet medium bomber, somewhat comparable to the Boeing B-47); the Bear (a new four-engine turboprop bomber or aerial tanker, with no United States counterpart); the Flashlight (a new all-weather interceptor, somewhat similar to the Northrop F-89 and the Lockheed F-94); and the Farmer (a new twin-engine supersonic day fighter). In the Soviet Aviation Day display, observers reported seeing, in addition to the foregoing, a glider with flapping wings, 4 twin-rotor helicopters capable of carrying from 50 to 60 troops, a jet-powered airliner, and 7 long-range turboprop bombers. United States defense officials have indicated that although Soviet aircraft are showing constant advances in both quantity and quality, the United States is continuing to maintain aircraft superiority, particularly in power plants.

(See also CIVIL AERONAUTICS ADMINISTRATION; NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS; and the Index entry, *Aeronautics*.)

FLIGHT RECORDS

National Aircraft Show.—Major trophy winners in the National Aircraft Show, held at Philadelphia, Pa., in September 1955, were as follows:

Thompson Trophy (18.11-km. course): Col. Horace A. Hanes, USAF, with F-100C Super Sabrejet; Palmdale, Calif., Aug. 20, 1955; average speed, 822.135 mph. at 40,000 feet (a new world speed record under timed and certified conditions).

Bendix Trophy (George Air Force Base, Victorville, Calif., to Philadelphia, Pa., 2,325 miles): Col. Carlos M. Talbott, USAF, with F-100C Super Sabrejet, on September 4; average speed, 610.726 mph.; elapsed time, 3 hr. 48 min. 4 sec., with one refueling stop.

Allison Engine Company Competition (for speed in changing engines): Crew from Webb Air Force Base, Big Springs, Texas, on September 4; elapsed time, 11 min. 32.2 sec.

BOEING AIRPLANE COMPANY

Military prototype of Boeing 707 jet stratoliner, planned for future use in American commercial aviation.

Unofficial U.S. Records.—Other records set in 1955 (aside from the official records listed below) included the following:

World speed record of 695.163 mph., set by Lieut. Gordon Gray, USN, in a A-4D Douglas Skyhawk jet attack bomber, on a 100-km. closed circuit, Edwards Air Force Base, Calif., October 15.

Los Angeles—New York record (2,530 miles in 3 hr. 40 min.), set by Lieut. Col. Robert R. Scott, with USAF Republic Thunderstreak jet on March 9.

Seattle—Andrews Air Force Base, Maryland, record transcontinental flight for jet airliners (2,340 miles in 3 hr. 58 min.; average speed, 570 mph.), set by A. M. Johnston, pilot, in a Boeing 707 Stratoliner, October 16.

Shannon, Ireland—New York record for transatlantic flight (10 hr. 33 min.), set by two Pan American World Airway's Douglas DC-6B's, June 7.

Japan—Australian nonstop record for single-engine jet planes (12 hr. 10 min.), set by four U.S. F-84 Thunderjet fighter-bombers, May 18.

Official Records, 1954-55.—In the period Oct. 1, 1954 to Oct. 1, 1955, the following national (U.S.) and international records were established and confirmed in various categories determined by the Federation Aeronautique Internationale (FAI), each flight being supervised and observed in accordance with FAI specifications. (For categories not shown below, no official records were established in the period under review.)

JET-POWERED AIRPLANES

Distance in a closed circuit without refueling: World "class" record, 1,938,700 km. (1,143,134 miles)—Miss Elisabeth Boselli (France) with Mistral aircraft; Mont de Marsan-Oran-Mont de Marsan course, Feb. 21, 1955.

Distance in a straight line without refueling: World "class" record, 2,331,220 km. (1,448,550 miles)—Miss Elisabeth Boselli (France) with Mistral aircraft; from Creil to Agadir, March 1, 1955.

Speed for 1,000 km. (621.369 miles) in a closed circuit without payload: World "class" record (559.643 mph.)—Capt. A. Hans M. Neij (Sweden) with SAAB S.29 monoplane; Nyköping-Natra-Nyköping course, March 23, 1955.

LIGHT AIRPLANES, LESS THAN 500 KILOGRAMS

(1,102.3 POUNDS)

Speed for 100 km. (62.137 miles) over a closed circuit: World "class" record (171.097 mph.)—Iginio Guagnellini (Italy) with Ambrosini G.F.4 "Rondone" airplane; Sesona (Vergiate)—Cameri-Seveso-S. Pietro course, Nov. 20, 1954.

Air Force's Convair F-102A, showing "pinch-waisted" design which increases the speed of supersonic aircraft.

U.S. AIR FORCE

Speed for 500 km. (310.685 miles) over a closed circuit: World "class" record (168,642 mph.)—Iginio Guagnellini (same as above).

Speed for 1,000 km. (621.369 miles) over a closed circuit: World "class" record (149,451 mph.)—Nello Valzania (Italy) with Ambrosini G.F.4 "Rondone" airplane; Sesona (Vergiate)—Cameri-Seveso-S. Pietro course, Dec. 19, 1954.

LIGHT AIRPLANES, 500 TO 1,000 KILOGRAMS (1,102.3 TO 2,204.6 POUNDS)

Distance in a closed circuit, without refueling: World "class" record (1,936.189 miles)—Frantisek Novak (Czechoslovakia) with Sokol OK-DHH aircraft; Brno-Hutsopece Letonice-Brno course, June 23, 1955.

ROTORPLANES

Altitude without payload: World "class" record (26,931 feet)—Jean Boulet (France) with SE "Alouette" helicopter; Buc Airport, June 6, 1955. **U.S. record** (24,521 feet)—W/O Billy I. Webster, USA with Sikorsky XII-39 helicopter; Bridgeport, Conn., Oct. 17, 1954.

LIGHT ROTORPLANES, BETWEEN 500 AND 1,000 KILOGRAMS (1,102.3 TO 2,204.6 POUNDS)

Altitude without payload: World "class" record (26,931 feet)—Jean Boulet (France) with SE "Alouette" helicopter; Buc Airport, June 6, 1955.

GLIDERS, SINGLE PLACE

Distance to a predetermined point with return to point of departure: World "class" and U.S. record (810.697 miles)—Lyle A. Maxey (United States) with Kerns sailplane; from Adelanto, Calif., to Independence, Calif., Sept. 4, 1955.

Speed for 200 km. over a triangular course: World "class" record (41,821 mph.)—Edward Makula (Poland) with "Jakolska" Sp-1522 sailplane; Lisie Katy-Przepalkowo-Zblewo-Lisie Katy course, Aug. 16, 1955.

Speed for 300 km. over a triangular course: World "class" record (24,673 mph.)—Gabriel Megerit (France) with Air-102 sailplane; St. Auban-Die-Mont Genevre-St. Auban course, Aug. 17, 1955.

GLIDERS, MULTIPLE PLACE

Speed for 200 km. over a triangular course: World "class" record (41,040 mph.)—Henry Zydorczak, pilot (Poland) with Bocian SP-1564 sailplane; Lisie Katy-Przepalkowo-Zblewo-Lisie Katy course, Aug. 14, 1955.

Speed for 300 km. over a triangular course: World "class" record (31,271 mph.)—Henryk Zydorczak, pilot (Poland) with Bocian SP-1564 sailplane; Lisie Katy-Przepalkowo-Zblewo-Lisie Katy course, Aug. 16, 1955.

FEMININE RECORDS

Gliders, single place—Altitude gained: World "class" and U.S. record (27,994.4 feet)—Miss Betsy Woodward (United States) with a Pratt-Read sailplane; Bishop, Calif., April 14, 1955. **Altitude above sea level:** World "class" and U.S. record (39,994 feet)—Miss Betsy Woodward (same as above). **Distance to a predetermined point with return to point of departure:** World "class" record (203,934 miles)—Maksymiliana Czielowna (Poland) with "Jaskolka" sailplane; from Mirosławice (Wroław) to Kobylnica (Poznań) and return, June 18, 1955.

Gliders, multiple—Distance to a predetermined destination: World "class" record (235,942 miles)—Miss Francine Abadie and Miss Jacqueline Trubert (France) with Castel 25 biplace sailplane; from La Ferte-Alais to Cognac, April 16, 1955. **Speed for 200 km. (at least) over a triangular course:** World "class" record (31,280)—Maksymiliana Czielowna, pilot, and Helena Niezabytowska (Poland) with Bocian SP-1551 sailplane; Lisie Katy-Przepalkowo-Zblewo-Lisie Katy course, Aug. 16, 1955.

LESLIE E. NEVILLE,

Former Director, Armed Forces Technical Information Agency.

AFGHANISTAN. This constitutional monarchy of Asia (area, 250,000 square miles), located northwest of West Pakistan, east of Iran, and south of the USSR, has a population (1954 est.) of 12,250,000, more than half being Pakhtuns or Pashtuns (Sunnite Moslems, following the Hanafite rites). Others are Tajiks (Sunnite), Hazaras (Shi'ite), Turkomans, and Uzbeks. Kabul (est. pop., 300,000) is the capital; other cities include Kandahar (est. 60,000), Herat (80,000-90,000), and Mazar-i-Sharif (est. 50,000).

Government.—King Muhammad Zahir Shah (b. 1914; succeeded 1933) governs with the aid of a prime minister and a cabinet. Gen. Muhammad Da'ud Khan has been prime minister and minister of interior since September 20, 1953. The constitution has a religious

basis, and Islam is the official religion. The legislature comprises a 45-member nominated Senate (Majlis-e-A'yan) and a 171-member elected National Assembly (Majlis-e-Shura). Annual revenue approximates 250 million afghanis (17.01 afghanis equal U.S.\$1.).

Education and Welfare.—Primary education throughout the country, and secondary instruction in all provincial capitals are free, with compulsory education through age 13, but a high percentage of the population is illiterate. In 1950 there were 325 primary schools with an enrollment of 78,581, and 654 secondary schools with an enrollment of 19,701. There are teacher-training and technical schools at Kabul and the provincial capitals. Kabul University, founded in 1932, has faculties of arts, medicine, science, politics, theology, and law. English, French, and German are taught in secondary schools and colleges; Pushtu, or Pashto, is taught in Persian-speaking districts. Through a \$210,000 grant made by the United States government, Teachers College, Columbia University, is assisting the Ministry of Education and the teachers training college at Kabul in the development of educational institutions; and through a similar grant the University of Wyoming has undertaken to develop training programs in Afghanistan in agriculture, engineering, education, etc. A medical-aid program to lower infant mortality and train child-health personnel is conducted by the U.N. Children's Fund (UNICEF). In 1954, a 4-year malarial control program was completed, aiding over 900,000 people and making possible the expansion of cultivation. Afghan women appear heavily veiled and take no part in public affairs.

Helmand River Valley Project.—Less than one fourth of the land has been under cultivation because of mountains and the scarcity of water. In 1946 an extensive irrigation program was begun on the Helmand and Arghandab rivers. In 1954 a loan of \$18.5 million was negotiated with the Export-Import Bank of Washington for the construction of more lateral canals, drainage projects, and hydroelectric power installations to implement two dams recently completed by an American firm. Only a small part of these funds had been used by the end of 1955. More than one sixth of the population will benefit from this long-range program.

Production and Trade.—Formerly, the skins of stillborn lambs of the karakul sheep (Persian lamb) were the most important export. With changes in American tastes and styles, however, American imports of lamb skins in 1955 had fallen to less than half of what they were in 1950. On the other hand, dam construction and United Nations technical assistance have greatly increased cotton production. Cotton and wool exports are now three times as great as those of lamb skins. Wheat, barley, and other grains, and indigenous plants of industrial and medicinal value are grown. Mineral production includes coal, copper, lead, iron, and oil. Prewar ties with Germany are being re-established. An Afghan-European Cultural Exchange has been set up in Munich, and a German medium-term credit arrangement, along with German purchases of cotton and wool, has made possible the construction of a cotton textile mill by German engineers.

Monopolies for transportation, generation of electricity, and manufacture of carpets, cotton textiles, and sugar have been granted to a number of Afghan trading companies; the government has a monopoly on the importation of motor vehicles, tobacco and cigarettes, gasoline, and sugar. The Afghan National Bank finances the procurement of foreign equipment and machinery for industrial development. Of all Afghanistan's exports, 80% go through Pakistan. Fruits (\$20 million in 1954) are exported to Pakistan, and karakul skins (\$10.5 million in 1954), wool, and nuts to the United States. Principal imports from the United States are cotton textiles, machinery, and sugar.

Transportation and Communications.—There are no railways in Afghanistan, although lines in the

USSR and Pakistan extend close to its border. Automobiles, trucks, camels, horses, and airplanes provide the transportation. In 1954 an American firm completed a road from Kandahar to Chaman in Pakistan. Internal air services are provided by the government-subsidized Afghanistan Air Lines. Kabul has air connections with Teheran and New Delhi.

Principal Events, 1955.—The prolonged dispute with Pakistan over the border provinces comprising Pashtunistan continued into 1955. On March 26, the Pakistani government declared its intention to incorporate the disputed area into the Province of West Pakistan. The Afghan government, which has demanded that the 7 million tribesmen of Pashtunistan be allowed to hold a plebiscite to determine whether they wish to become an independent state or to remain part of Pakistan, protested against the proposal on March 29. On the following day some 15,000 Afghans mobbed the Pakistani embassy in Kabul, tore down its flag, and invaded and destroyed the quarters of the Pakistani ambassador. Mediation conducted by Musaid ibn al-Rahman of Saudi Arabia during May and June was reported to have brought an agreement, but no details were announced.

On July 14, 1955, Afghanistan became the 57th member of the International Monetary Fund and the International Bank for Reconstruction and Development. The quota set for Afghanistan in the fund was \$10 million, and its subscription to the bank was 100 shares valued at \$10 million. During the year a new commercial code of law, modeled after the Turkish and Swiss, was enacted to replace the old religious (shariat) and customary law.

Following their state visit to India and Burma, Soviet Premier Bulganin and Communist Party Secretary Khrushchev went to Afghanistan on December 15 for a 5-day visit.

SYDNEY N. FISHER,

Professor of History, Ohio State University.

AFRICA. The second largest of the continents. Estimated area, 11,703,000 square miles; pop. (est. 1954), 214 million. Africa consists mainly of possessions and territories of France, Great Britain, Belgium, Portugal, and Spain. Independent African nations are Ethiopia, Egypt, the Union of South Africa, Liberia, and Libya. The former condominium of the Anglo-Egyptian Sudan declared itself an independent republic on Jan. 1, 1956. Somaliland, a United Nations trust territory administered by Italy, is scheduled to obtain independence in 1960. Other trust territories are British Cameroons, French Cameroons, British Togoland, French Togoland, Tanganyika (British administered), and Ruanda-Urundi (Belgian administered). Tangier, part of the sultanate of Morocco, is under an international administration. Certain French, Portuguese, and Spanish territories are administered as provinces or departments of the mother country. The former mandated territory of South West Africa is governed virtually as a fifth province of the Union of South Africa, although its legal status is not settled. (See also articles on African countries.)

AFRICAN-ASIAN CONFERENCE. See **ASIAN-AFRICAN CONFERENCE.**

AGRICULTURAL RESEARCH SERVICE. This agency conducts all of the U.S. Department of Agriculture's production and utilization research (except forestry research) and crops and livestock regula-

tory programs. Some of the more recent developments of interest are summarized below.

Crops Research.—Growth-regulating chemicals, which in lethal dosages clear lands of weeds and unwanted brush, continue to show amazing diversity in constructive use on crop plants. Low-dosage application of 2,4,5-T produced lima bean plants $2\frac{1}{2}$ times the size of unsprayed ones and increased yields of fresh beans 200 to 300 pounds per acre. Sprays of this chemical increase size, advance maturity, and prevent fruit drop of apricots.

A chemical spray caused foul-smelling fruit of the highly prized ornamental ginkgo tree to fall off. A new sprout inhibitor has proved highly effective for stored Irish potato tubers, but will not be released for commercial use until proved safe for consumers.

Antibiotics, already widely useful in combating animal diseases, hold promise of controlling not only many bacterial but also some fungus diseases of plants. They have proved effective experimentally, in varying degrees, against such bacterial diseases as leaf spot of sesame, angular leaf spot of cucumber, bacterial spot of pepper, wetwood of trees, and rot of the giant cactus. They are also effective against certain fungus diseases, such as bean rust and downy mildew of lima bean.

A recent discovery that fungi (which contain no chlorophyll) respond to light, may mean that they can serve even better than green plants as tools for studying plant reactions to light.

As a result of chemical and clinical examinations of many plant collections, andromedotoxin, a substance extracted from *Rhododendron maximum*, is now being tested clinically on humans. From the seeds of a tropical tree in Puerto Rico was found a new source for the drug Bufotenine, a valuable narcotic for heart and mental conditions.

New Crop Varieties.—Improved crop varieties recently developed include a long-grain rice variety; oat varieties resistant to all known races of oat stem rust; a superior winter barley; a superior dryland stripper cotton; a blight-resistant cotton; a hybrid disease-resistant spinach; a hardy, resistant orchard grass; two nonshattering sesame varieties; an early-maturing, shatter-resistant castorbean; an early, resistant onion; a superior Zoysia hybrid lawn grass; a disease-resistant sugar beet; a wildfire resistant burley tobacco; and a high-yielding early soybean.

Grain sorghums have been developed that are shorter-stalked, straighter-necked, faster-maturing, and more disease-resistant. Hybrid grain sorghum seed will be available to growers for the first time in the spring of 1956, with potential yields of 20 to 40% over currently used varieties. Sorghum and Johnsongrass are being crossed to develop a new perennial forage crop for the South.

Entomological Developments.—Screwworms were eradicated from the Caribbean island of Curacao by an entirely new method of biological control—release of male flies, made sterile by radioactive rays, to mate with wild female flies. (See also **ZOOLOGY.**)

Three diseases of harmful insects look especially promising as control agents: a virus disease of armyworms, a bacterial disease of pink bollworm, and a fungus disease of several pests.

Free-choice phenothiazine, properly employed, may present an entirely new approach to cattle-grub control, and may also be the most powerful weapon available for combatting losses

from parasitism in cattle. Water-soluble insecticides offer real hope for control of mosquitoes that breed in irrigation water.

Beneficial insects are increasingly utilized. Honeybees, long proved valuable as pollinators of alfalfa and other crops, recently proved equally good pollinators of carrot seed and cotton. Their use may make commercial production of hybrid cotton practical.

A mite so small it cannot be seen without a microscope has been identified as the carrier of peach mosaic, destructive virus disease of stone fruits.

Crops Regulatory Programs. Plant Pest Control.—A federal quarantine against the European chafer, a serious agricultural pest first recognized in the United States in 1940, went into effect in September to guard against spread from infested areas of Connecticut, New York, and West Virginia.

The soybean cyst nematode, previously unknown in the United States, was found in North Carolina. It causes the soybean condition known as "yellow dwarf."

Spread of insects into new areas caused concern during the year. Surveys revealed the yellow clover aphid in previously uninfested areas of the West, a few citrus blackflies in Texas, the gypsy moth southwest of the 80-year-old New England infestation, and the Mexican fruit fly in Lower California.

A cooperative federal-state program to control the burrowing nematode that causes spreading decline of citrus got under way in Florida. The malady was first noted in Florida in the late 1920's, but not until 1953 was the nematode proved responsible for the condition.

In large-scale control operations against older pests, more than 1½ million acres of Western range land in 11 states were insecticide-sprayed for grasshopper control; almost 100,000 acres in 6 states were treated for Mormon cricket control; and more than a million New England acres were sprayed, using aircraft to control the gypsy moth.

Plant Quarantines.—Enforcement of both foreign and domestic plant quarantines continued to protect the United States against entry and distribution of foreign plant pests. Some 18,500 destructive plant pests—11,500 insects and 7,000 plant diseases—from throughout the world were intercepted during the fiscal year 1955 in agricultural products in cargo, stores, baggage, mail, or as stowaways aboard vessels, planes, railway cars, and vehicles.

More than 48,000 vessels and nearly 90,000 planes from overseas were inspected at United States ports; over a third carried prohibited or restricted plant materials. During inspection of over 15,240,000 vehicles, 2,265 Pullmans and coaches, and 85,800 freight cars arriving from Mexico, in excess of 4,000,000 pieces of baggage were examined. Out of more than 3¼ million foreign mail packages inspected at various ports of entry, some 1,550 contained prohibited plant material and were refused entry.

Plant quarantine inspection of bulbs continued in Holland, Belgium, and France during the 1954-55 shipping season. These included inspections in Holland of 416 million bulbs; in Belgium, of 12,465,000 bulbs; and in France of 2,062,000 bulbs. Performance of this work in Europe again resulted in gardeners' and bulb growers' getting cleaner, healthier bulbs, at less inspection cost to the government.

Farm and Land Management Research. Agricultural Engineering.—More efficient mechanical

means of producing and processing crops are constantly being developed, adapted, or improved. Recent developments include an improved, inexpensive hose pump for metering liquid fertilizer; a new mechanical silage feeder that reduces hand labor and cuts time spent in feeding animals by two thirds; two devices for tipping beehives that considerably reduce hand labor required for handling hives; a new method of mechanical harvesting and curing of Virginia-type peanuts that saves labor and materials; fertilizer-placement machines; a mechanical tung nut harvester; a sugar beet thinner using counter-rotating heads; and equipment for cutting leaves of and transplanting sansevieria, a long-fiber crop.

Mechanization continues to improve cotton-production efficiency. A cotton ginning research laboratory has been established at Clemson, S.C., to seek solutions of Southeastern ginning problems. An opener and fluffer developed a few years ago is already handling 25% of the domestic cotton processed. A test machine recently developed, a combined opener and cleaner, would replace 4 or 5 machines now needed. A new cotton-planting attachment for use with lister planters in the Southwest could ultimately save \$6-10 million annually in cost of replantings. Handling operations for ginning extra-long-staple cotton have been improved. Pink bollworms remaining in wastes from cotton ginning and oil mill operations are killed by inexpensive equipment developed to impede the insect's spread and permit use of gin wastes on land to control erosion and build soil.

Soil and Water Conservation.—A new, rapid, easily applied method determines in advance the probable degree of wind erosion of any soil during the next windy season. This will permit better selection of practices for emergency control programs and—more important—should help point out required cropping and tillage practices.

Charts and formulas have been developed for use of designers of spillways to assure satisfactory performance of these key structures for channel stabilization in soil conservation.

Using radioactive phosphorus as a research tool, soil scientists have learned to measure available phosphate in any soil so accurately that it can be expressed in terms of pounds of superphosphate equivalent per acre. By using a radioactive isotope of sulfur as a tracer, they have found that cotton plants absorb part of their sulfur requirements from the air as sulfur dioxide.

Financial Condition of Farmers.—Total value of farm assets—farms, livestock, machinery, crop inventories, household goods, bank deposits, and other financial assets owned by farmers and other farm-property owners—was about \$163 billion at the beginning of 1955, 1% above a year earlier but about 4% below 1952's peak. Total farm debts rose nearly a billion dollars in 1954, from \$17.1 billion to \$18.0 billion. Total farm-mortgage debt increased in 1954 for the ninth consecutive year, and at the start of 1955 totaled \$8.2 billion, 72% above the postwar low in 1946. It continued to rise in 1955. Farm real estate values rose slightly during the year ended in March 1955; farm sales volume was 5% above the previous year's volume. Taxes on farm real estate increased in 1954 for the 12th consecutive year, pushing the average tax per acre to an all-time high. Farm personal property taxes for 1954 declined about 3%, mainly in livestock assessments. Farm fire losses continued to mount, totaling \$157 million in 1954.

Livestock Research.—Preliminary results of stilbesterol-feeding experiments refuted widespread reports that using the hormone-like chemical as a growth stimulant for feed-lot animals resulted in poor-quality carcasses. They showed instead that stilbesterol can increase rate of gain without adverse effect on meat quality.

A research-developed mammary-gland scoring system enabling dairymen to rate the milk-production potential of 4- and 5-month-old calves, now under test in 15 states, may soon make it possible to choose potentially high-producing replacement cows from young calves.

Fatty acids usually produced in the rumina of cattle and sheep by other bacteria and used by important fiber-digesting bacteria have recently been identified as essential for the latter's growth. It may be possible to add such factors to ruminant rations to increase digestion and thus speed up growth.

Noteworthy gains on the livestock disease front will permit advances in research on the virus of foot-and-mouth disease, make for more positive early diagnosis and improved control of vesicular stomatitis, and will make possible, for the first time, an extensive United States survey of anaplasmosis. Ways have been found to differentiate vibrios—a genus of bacteria—that cause vibriosis in cows from those that do not, and to cut the number of brucellosis-vaccinated animals classified as suspect and increase numbers classified as negative.

Recent swine disease research has made practical the diagnosis of atrophic rhinitis and the prevention of "yellow fat" disease, and aids in checking the spread of vesicular exanthema.

With a vast saving in time and work, scientists may be able to immunize at one time large numbers of chickens or small fur-bearing animals by spraying live virus vaccine into an enclosed area. They have recently discovered that resistance to the cancerous poultry disease, visceral lymphomatosis, may be passed to chicks through eggs from vaccinated hens inoculated with massive doses.

Livestock Regulatory Programs.—All horses, ruminants, swine, and poultry offered for importation into the United States were carefully inspected at coastal, air, and border ports of entry. Certain animals and poultry are quarantined upon arrival, to prevent bringing diseases of foreign origin into the United States. Eight times during the year, Newcastle disease was detected in quarantined poultry. Strains isolated proved to be highly lethal.

Mexico was declared free of foot-and-mouth disease on Dec. 31, 1954, and the border was reopened on Jan. 1, 1955, resulting in an influx in the importation of cattle from Mexico.

Particular attention was given to preventing the landing of fresh, chilled, or frozen meats, or garbage derived therefrom, from air and ocean transports provisioned in countries where foot-and-mouth disease or rinderpest exists.

Unsterilized hay and straw used as packing materials from such countries was destroyed. During the year ended June 30, 1955, 28,542 first-port-of-call coastal vessels and 52,386 airplanes arrived in the United States in foreign commerce.

Cooperative research and regulatory action is being taken against several apparently new diseases of cattle recently reported from scattered locations throughout the United States in various forms under such names as viral diarrhea, mucosal disease, and rhinotracheitis.

WIDE WORLD

U.S. Secretary of Agriculture Benson tours Colorado's drought area in April 1955.

Home Economics Research.—Three branches of the Agricultural Research Service, dealing with research on human nutrition, clothing and housing, and household economics, were established during the year to replace the two former human nutrition and home economics research branches.

A reference diet for human nutrition studies has been developed as a research tool for determining individual needs for practically any important nutrient except amino acids and for measuring their use by the body.

New food composition tables were issued, in which calories for hundreds of individual foods have been calculated from specific factors—replacing general factors developed some 50 years ago. They are especially useful in calculating calories for individual foods, special diets, and international food supplies.

Studies of school children's diets showed that boys' intake of food energy and key nutrients at successive years increased fairly consistently, except in the case of calcium. Girls increased their intake irregularly, and beyond the age of 12 their consumption leveled off or declined, falling below desirable allowances in most nutrients. Children tested tended to eat small breakfasts and large snacks, getting 13 to 17%—or even more, among the older children—of their calories from food between meals.

Utilization Research.—Transforming perishable foods into more storable form continued to help adjust marketing to demand. Newly developed were a lemonade powder rich in natural flavor, and tasty new French-fried vegetable snacks—chips from sliced carrots, beets, and parsnips, and "nuggets" from whole peas and lima beans.

Dehydrofreezing, a combination food-processing technique now coming into commercial use, may soon help to place on the market apples, apricots, green peas, and pimientos that combine space and weight economies of dehydration with convenience and freshness-retention of freezing.

A new direct-consumption sugar suitable for candymaking without refining has been produced at low cost from sugarcane.

Two complex chemicals, discovered in the tubers of a rare Mexican yam, show promise as superior raw materials for synthesis of the drug cortisone.

E. G. MOORE,
Director, Information Division.

AGRICULTURE. United States agriculture in 1955 produced a new all-time record output of food and fiber. As the year neared its end, total farm output was estimated to be about 4% above 1954, about 12% more than the 1947-49 aver-

age, and almost 50% above the 1935-39 average output. Crop production was equal to the 1948 record and about 6% more than the 1947-49 average, while livestock production set a new record. Crop yields per acre were the largest in United States history, exceeding the 1948 peak by about 9%.

Farm prices reached their all-time peak in February 1951, after rising sharply during the latter half of 1950. Following the February peak, a declining trend set in and continued through 1952-55. In November 1955, prices received by farmers averaged 7% lower than in the same month of 1954, and some 28% below the February 1951 level. Farm production costs, on the other hand, reached an all-time high in 1952 and had declined but little through 1955.

Food consumption per person in the United States during 1955 was estimated to be 13% above the 1935-39 average, and about 1% larger than in 1954. In 1956 food supplies per person are expected to continue at about the same level. No great change in general farm prices or retail food prices was expected in 1956.

U.S. Farm Production.—Despite the third successive year of damaging drought in important areas of the nation, record yields elsewhere raised crop production 6% above the 1947-49 average. Record production of soybeans, hay, and oats contributed to the high crop output, as did above-average crops of sorghum grain, barley, corn, rye, flaxseed, cotton, dry beans, tobacco, sugarcane, sugar beets, cherries, grapes, apricots, and cranberries. Output of wheat, peaches, pears, apples, peanuts, potatoes, sweet potatoes, dry peas, pecans, and hops was relatively small.

Acreage.—Wheat and cotton acreages were curtailed sharply by the production control programs in effect during 1955; however, larger acreages of some crops tended to balance out these declines. Major crops were grown on about 353 million acres, about 5 million fewer than in 1954.

Food and Feed Grains.—Production of the 8 food and feed grains in 1955 was far above average. The large output and extremely large carry-overs resulted in the largest supplies of grains for the 1955-56 marketing year ever accumulated in United States history.

Total wheat production in 1955 was estimated at 916 million bushels, compared with 970 million in 1954 and an average of 1,154 million bushels in 1944-53. Wheat supplies for the marketing year were estimated at a record high 1,940 million bushels. This included the 1955 crop, expected imports of 4 million bushels of feeding-quality wheat, and carry-over stocks of 1,020 million bushels. Domestic requirements of wheat in 1955-56 may total around 625 million bushels, and exports may run about as high as in 1954-55—274 million bushels. This would result in a carry-over on July 1, 1956 of some 1,041 million bushels.

Because of record heavy supplies of wheat, acreage allotments and marketing quotas on 1956 wheat were proclaimed by Secretary of Agriculture Ezra Taft Benson during the summer of 1955 and submitted to a vote by the nation's wheat producers. In a national referendum (July 1955), 78% of the producers voting cast affirmative ballots. A two-thirds approval is required.

The wheat acreage allotment for 1956 is 55 million acres, the same as in 1955. With average yields, this could produce a crop of 860 million bushels, which might result in some reduction in carry-over in July 1957. It should be noted,

however, that harvested acres in 1955, totaling only 47 million, brought a crop of 916 million bushels. This illustrates the difficulty of bringing production and consumption into line through acreage and marketing restrictions alone.

The 1956 wheat crop will be price-supported at not less than \$1.81 per bushel, which is 76% of the parity price at the beginning of the marketing year. This compares with \$2.06 (82.5%) on 1955 wheat.

Corn production for 1955 was estimated in November at 3,183 million bushels, 7% more than the 2,965 million of 1954, and 3% above the 1944-53 average of 3,080 million bushels. Drought in the western part of the corn belt reduced yields, but there were bumper crops in the northern and eastern parts of the belt. The support level for 1955 corn was at 87% of parity, or \$1.57. Corn supply for 1955-56 was estimated at about 4,200 million bushels. This was 9% larger than the 1949-53 average, and a new record. (See also GRAINS.)

Cotton.—A cotton crop of 14.8 million bales was forecast on the basis of November 1 information. This was 8% more than the 1954 crop of 13.7 million bales and about 15% above the 1944-53 average of just under 13 million bales. Cotton supplies for the marketing year ending July 31, 1956, were estimated at more than 25 million bales. Requirements for the year may be about 12 million bales. Because of these extremely large supplies, acreage allotments and marketing quotas of 10 million bales were proclaimed for 1956 cotton.

Other crops.—The biggest soybean crop on record—372 million bushels—29% more than the previous record of 1954 and 56% above the 1935-39 average, was a striking feature in the 1955 agricultural picture.

The rice crop of 52.4 million 100-pound bags was 11% below the 1954 record, but one third above average.

Production of sorghum grains, totaling 227 million bushels, was 11% more than in 1954 and two thirds larger than the 1944-53 average.

Output of commercial fresh vegetables was somewhat below 1954, and prices were better. Output of all vegetables was estimated to be about 3% below a year earlier.

Production of deciduous fruits was slightly less than in 1954, but a little above average.

Tobacco production was estimated at 2,278 million pounds, compared with 2,236 million pounds in 1954, and was 9% above average.

Potato production—384 million bushels—was 8% above 1954 but 4% below average.

Late summer storms and fall hurricanes and floods did considerable damage to tobacco fields and caused losses to fruit producers in the Eastern states. (See also FRUITS; TOBACCO; VEGETABLES.)

Livestock.—Production of livestock and livestock products reached a new high in 1955. Aggregate production of beef, veal, lamb, mutton, and pork was estimated at 26.7 billion pounds. This was 5% larger than the 1954 total, and a new record. (See also MEAT INDUSTRY.)

From 1945 through 1948, cattle numbers declined. From 1949 through 1954, a rising trend was in effect, and cattle numbers increased by about 19 million to a total of 95.4 million head at the beginning of 1955. There was very little change in numbers during 1955.

Hog production in 1955 was estimated at 101 million head, about 9% more than in 1954.

The 1955 lamb crop, about 20 million head,

was slightly below 1954. From a peak of 56 million head in 1942, sheep and lamb numbers dropped sharply to 29.8 million at the beginning of 1950. There was some recovery in 1950 and 1951 and relative stability in 1952, followed by another decline. Sheep and lamb numbers at the beginning of 1955 were thought to be about 30.9 million head.

The poultry industry continued to set new records in 1955. Broiler production increased for the eighth consecutive year of record output. About 60% of all chicken meat consumed in 1955 was from broilers. Egg production was about 2% above the previous high of 1954 for the seventh successive year of increase.

Milk production for 1955 was estimated at a record-breaking 124.5 billion pounds, as against the previous high of 123.5 billion a year earlier. Milk production per cow continued to rise, and averaged more than 5,600 pounds for the year. (See also DAIRY PRODUCTS.)

Agricultural Income and Prices.—Farm net income fell sharply again in 1955. Gross income, comprising cash receipts plus the value of home-consumed farm products, rental value of farm dwellings, and government payments, totaled \$32.9 billion, compared with \$34 billion the year before. Farm production expenses amounted to \$22.3 billion, slightly above the \$22.2 billion in 1954.

Total net income derived by farm operators from farming was about \$11 billion in 1955, more than \$1 billion less than in 1954, and \$6.7 billion less than the peak income of \$17.7 billion (revised figure) reached in 1947. In terms of buying power, farm operators' net income was lower in 1955 than in any year since 1940.

Farm prices reached an all-time high in February 1951, after which they went into a prolonged decline which was still in progress during 1955. The index of prices received by farmers on Nov. 15, 1955, stood at 225% of the 1910-14 average. This contrasted with 242% for the corresponding date a year earlier, and the high of 313% in February 1951. Prices paid by farmers on Nov. 15, 1955, were 259% of the 1910-14 average, compared with 262 in November 1954.

In terms of the parity ratio (parity being the price at which farm products would have the same buying power as they had in 1910-14) farm prices in November 1955 were down to 81%, compared with 87% a year earlier, and the record high of 123% in October 1946.

Consumption of Food.—Domestic food utilization in 1955 was about 48% larger than in the prewar period, 1935-39. Civilian consumption of food per capita in 1955 was 1% larger than in 1954, and about 13% higher than in 1935-39. The people of the United States consumed per person record amounts of eggs, broilers, and beef, and slightly more butter, milk, and ice cream than in 1954. Pork consumption per capita was about 66 pounds, compared with 60 pounds in 1954. This, however, was well below the 72 pounds of 1952.

Civilian consumption of beef, at 81 pounds per person, set a new record for the third consecutive year. Per capita consumption was 79 pounds in 1954 and 77 pounds in 1953. Per capita consumption of all "red meats" was about 161 pounds, the second highest rate on record, exceeded only by the 163 pounds consumed in 1908.

Due to the heavy production of 1955, the large numbers of cattle and pigs on farms, and big feed supplies, prospects for 1956 indicated

SOVFOTO

Member of American agriculture delegation, touring USSR in July 1955, accepts gift from collective farmer.

continued large consumption of meat, dairy products, fats, and other foods.

Farmers' Share of the Food Dollar.—Farmers received about 42 cents out of each dollar spent for food in the family "market basket" during 1955. This contrasts with about 44 cents in 1954, 45 cents in 1953, 47 cents in 1952, and 53 cents in 1946.

Agricultural Assets.—The physical assets of United States agriculture increased 2% in dollar value in the year ended Jan. 1, 1955. Total assets were valued at \$163 billion, compared with \$159.8 billion a year earlier, and \$165.4 billion on Jan. 1, 1953. Proprietors' equities were \$145 billion, an increase of \$2.3 billion for the year. Debts owed by farmers rose from \$17.1 billion on Jan. 1, 1954, to \$18 billion on Jan. 1, 1955. During 1955, total farm debt probably increased considerably.

Land Values.—The steep rise in farm real estate values, stemming from the outbreak of fighting in Korea in mid-1950, reached a peak in 1952 and then began a decline which continued into 1954. In 1955 land values rose significantly. In November 1955 the average per acre value of farm land was 5% higher than in the fall of 1954, and equal to the November 1952 peak.

Agricultural Exports.—United States agricultural exports, at a postwar low in 1952-53, rose

Soviet agriculture delegate (with hat), on U.S. tour in August, examines Beltsville, Md., livestock.

WIDE WORLD

4% during 1953-54 and 7% more in 1954-55. The value of agricultural exports in 1954-55 was \$3,143 million, compared with \$2,900 million the preceding year and with the all-time record of \$4,100 million in 1951-52.

Factors contributing to the sharp decline in farm exports since 1951-52 included improved agricultural production outside the United States; reduced inventories in importing countries in response to the eased world supply situation; reduced U.S. foreign economic aid; a continued, though less stringent, dollar shortage abroad; and low world prices for several commodities, compared with United States prices. Much of the drop has been in exports to Europe, the biggest customer for United States agricultural exports.

The rise in shipments abroad during 1953-54 and 1954-55 was largely due to aggressive marketing and vast disposal operations by government. The Agricultural Trade Development and Assistance Act of 1954 provided for expanding world trade in farm products through exchange for foreign currencies, barter, donation, and other means. During the 12 months ended June 30, 1955, \$2.1 billion worth of surplus farm commodities were moved into consumption through domestic and export sales and other methods.

Price Support Operations.—Agricultural prices in 1955 averaged about 15% below parity, a drop of 4% from the 1954 parity ratio level. This declining price situation led to continued heavy price support activity. Support extended on 1954 crops (during the fiscal year 1955) totaled \$2,943 million. This was much less, however, than in the preceding year when \$4,306 million was extended on 1953 crops. Net losses on the price support program were the heaviest of record—\$799 million, compared with \$419 million in fiscal 1954 and \$61 million in fiscal 1953.

Agricultural Employment.—An estimated average of 7,993,000 persons (including farm operators, hired workers, and unpaid family labor) worked on United States farms in the January-August period of 1955, about 3% less than the 8,251,000 employed on farms for the corresponding period of 1954. An average of 11,500,000 persons were employed in agriculture in 1945-49. As in previous years, about three fourths of the persons working in agriculture were operators and unpaid members of farm families. Hourly wages for hired labor, exclusive of room and board, averaged 88 cents in July 1955, 1 cent more than in July 1954.

Other Highlights of 1955.—The Rural Electrification Administration (q.v.) celebrated the 20th anniversary of its existence during 1955. Less than 11% of all farms had power-line electric service in 1935. In 1955 about 93% of all farms had power-line electricity, more than half being served by REA lines. REA completed its sixth year of operation of its telephone lending program in October 1955. As of June 30, 1955, REA had allocated \$234 million in funds to extend and improve rural telephone service to an estimated 500,000 subscribers.

The Farmers Home Administration (q.v.) assisted farm families with \$293 million in credit services for improved farm management, soil and water conservation, and drought aid.

Legislative measures affecting agriculture in 1955 included increased appropriations for research and extension services. The borrowing authority of the Commodity Credit Corporation (the agency through which price support activities are carried out) was increased from \$10 billion to \$12 billion.

A rural development program was started by the Department of Agriculture to help farmers and rural dwellers in low-income areas acquire and take advantage of opportunities to improve their levels of living. The program was planned to get under way in 50 pilot counties. Congress failed, however, to provide the full funds requested, and the program was curtailed.

Under the Watershed Protection and Flood Prevention Act of 1954 and other legislation, significant progress was made in helping local groups in small watersheds plan small dams and other water-management facilities.

The national forests produced 6.38 billion board feet of timber, a record yield. The Forest Service suppressed nearly 10,000 fires. (See also **FORESTRY.**)

The program to wipe out brucellosis in cattle was expanded, with 14 million cattle tested for this disease during the fiscal year 1955.

The Foreign Agricultural Service celebrated its silver anniversary during 1955.

The World Food Situation.—Production of nearly all major food products in 1955 was larger than a year earlier. Forecasts of the 1955 bread grain crops—wheat and rye—indicated a total harvest of about 265 million short tons, about the same as the previous record crop of 1953 and nearly 5% above that of 1954.

In Canada (q.v.), conditions for the wheat crop were much better than a year earlier, and production was about two thirds above 1954. Crop conditions were also more favorable for wheat in the eastern European countries as a whole, and in the Soviet Union. In these areas crops were substantially larger than in 1954, and the total output of wheat may have been the largest for any postwar year. Throughout the rest of Europe the wheat crop was about as large as in 1954, but the quality was much better. France again had substantial quantities for export, and Italy, with a crop considerably larger than in 1954, required less exports after the 1955 harvest. The main European countries reporting smaller wheat crops in 1955 were Portugal, Spain, the Scandinavian countries, the Netherlands, and the United Kingdom and Ireland. Asia's wheat crop was nearly as large as in 1954, and declines in Africa and South America were partly offset by an increase in Australia.

Conditions for the 1955 rice crop were more favorable than in 1954, though production in India was hampered by early season floods. Japan reported a record rice crop, and conditions in several other Southeast Asian countries indicated some increases over 1954. United States production was down, but output continued at high levels in Europe. The South American countries harvested a record crop of rice in early 1955, and another large acreage was indicated for 1956.

Supplies of feed grain were large, the combined world production of barley and oats being the largest in any postwar year. Early indications pointed to a world record corn crop, with most of the increase being in North America, eastern Europe, and the USSR.

World sugar production continued at a high level despite the attempt of some surplus producers to curtail production. The first estimates of sugar beet production, 85% of which is in Europe and the USSR, were for production about 4% above 1954, due largely to favorable crop conditions in the USSR and eastern European countries. Turkey, Iran, and Japan also harvested larger crops. (See also **SUGAR.**)

World production of edible fats and oils has

been gradually increasing, and continued to do so in 1955 because of larger soybean and peanut crops and increased lard production. World consumption and trade were at high levels, however, and stocks of edible oils were reduced to manageable proportions in nearly all areas. (See also **FATS AND OILS.**)

Meat production increased during 1955 and the high level of production is likely to be maintained in 1956. World pork output continued to increase in almost every pork-producing country. World cattle and sheep numbers were at record levels and were still increasing during 1955. Further moderate expansion in supplies of pork, beef, and mutton is indicated for 1956 on the basis of these large animal numbers.

Dry weather during the late summer months reduced the output of milk in some areas, and world production was slightly below that of 1954.

World trade in food products was at a high level in 1955 and is likely to continue high in 1956. While some important deficit areas, such as Japan and Yugoslavia, will need less food imports because of their large 1955 output, industrial activity is continuing at a high level throughout the world. Thus, there is a continued active demand for food products, particularly the non-staple products such as meat, dairy products, and fruits.

(For further references, see the Index entry, *Agriculture.*)

CLARENCE J. ENZLER,
Administrative Officer, Office of the Secretary,
U.S. Department of Agriculture.

AIR CONDITIONING AND REFRIGERATION. The value of shipments by United States manufacturers in 1954 is estimated at \$695 million, approximately 10% over 1953. Estimates of 1954 shipments, by major product groups, are as follows:

MANUFACTURERS' SHIPMENTS, 1954

Product group	Units	Value (\$'000)
Condensing units.....	545,200	\$ 61,525
Compressors, compressor units.....	2,150,000	106,802
Centrifugal refrigeration systems.....	530	19,471
Heat exchangers, all types.....		119,684
Room air conditioners (1½ hp. and less).....	1,215,200	229,569
"Residential" air conditioning products.....	56,400	40,053
Self-contained air conditioners (over 1½ hp.).....	78,500	84,360
Ice makers (unitary).....	23,100	12,127

(Estimates are by the author.)

Packaged air conditioning products constitute approximately one half of the industry's output, including room air conditioners which alone account for one third of the total. While there was a reduction in shipments of self-contained air conditioners (over 1½ hp.) during 1954, room air conditioner shipments increased. Unfavorable weather during 1954 reduced retail sales below expectations. Production control and other favorable factors corrected the situation in 1955, when the retail sales rate jumped to 1,300,000 units, as compared with 1,000,000 in 1954. According to the Air Conditioning and Refrigeration Institute, August 31 factory and distributor inventories were a "healthy" 206,700 units in 1955, as compared with 512,471 in 1954.

Comfort air conditioning (central station systems) in public buildings kept pace with construction in 1954 and 1955, and this strong trend continues without signs of contraction of demand. Of particular importance are new and

existing office buildings, banks, hotels, hospitals, department stores, and shopping centers.

Residential air conditioning is viewed as one of the most promising markets of the industry, and is being developed vigorously by manufacturers of heating and cooling equipment. The author estimates that 55,000 installations were made in 1954; installations in 1955 may have totaled between 90,000 and 95,000.

New markets are developing in the transportation field: air conditioning for passenger cars, buses, and subway trains, and mechanical refrigeration for freight cars, short-haul delivery trucks, and intercity trucks. Most significant in numbers are air-conditioned passenger cars; in 1954 approximately 75,000 automobile air conditioning units were sold, and 1955 sales were estimated to reach 200,000. As of Jan. 1, 1954, there were 377 mechanical refrigerator cars in service, and 282 on order; when present car-building programs are completed, however, there will be over 1,100 mechanical refrigerator cars in frozen food service. The present programs are primarily experimental.

In the area of product development, there is a trend toward air-cooled apparatus, and larger sizes in room air conditioners and self-contained air conditioners.

V. T. KARTORIE,
Manager, Market Research, York Corporation.

AIR FORCE, U.S. The predominant role of air power in American military planning as a deterrent to aggression or in actual war, so clearly defined in 1954, was further emphasized by the appropriations for fiscal year 1956, passed by Congress on June 30, 1955. Of the total military appropriations of \$31,882,815,726, approximately 46% (\$14,739,763,170) was for the U.S. Air Force.

Research and Equipment.—The place of guided missiles in the USAF was likewise emphasized by several actions. A fourth squadron of Matadors (ground-to-air missiles) was activated; the Falcon, the air force's first air-to-air missile, was put into accelerated production; announcement was made of the Bomarc, the Navaho, and other missiles under development, and of the Atlas, an intercontinental ballistic missile (ICBM) to be launched by rocket motors. A new air force regulation of Aug. 15, 1955, stated air force intention to integrate guided missiles with manned aircraft in accordance with a program designed to achieve operational capabilities as soon as possible.

The first of the new heavy eight-jet B-52's were delivered in June 1955 to replace the propeller-driven B-36's, which are no longer in production. All medium bomber and reconnaissance units have now been converted to jet B-47's, production of which will end in 1956. All fighter aircraft in the air force are now jet-propelled, and the F-84 and the F-86 are gradually being replaced with newer types.

Intelligence concerning the numbers and types of new Russian jet aircraft caused the USAF to take certain immediate and specific steps to speed its weapons program. Production of the B-52 was accelerated by 35 per cent, and accelerated production of the fast F-101 Voodoo all-weather interceptor and the supersonic F-104 day fighter aircraft was also ordered. The scope and volume of basic scientific effort was increased through a new Office of Scientific Research. Acceleration of the weapons system development cycle was attempted by eliminating

UNITED PRESS

preliminary design competitions before award of contracts. Conversion of domestic bases to handle the new aircraft has proceeded, as has construction of bases overseas, especially in Spain (q.v.). The USAF is developing an atomic-powered airplane which, with its greater range, should eventually free the air force from all dependence on overseas bases.

A radical aeronautical development of several years ago was revealed in September 1955 with the first announcement of the reasons for a new pinch-waisted design in military aircraft which has produced increases in supersonic speeds of up to 25 per cent. The indentation of the fuselage at the point where the wings are attached greatly reduces the "drag rise" that occurs as speed approaches and goes beyond the sound barrier. This enables the aircraft to attain greater speed without an increase in power. This new development has already been applied to the supersonic jet F-102-A, a delta-wing interceptor first flown in 1954.

Acceleration in the defense effort included progress on the distant early warning (DEW) line across the Canadian Arctic. The first of the "Texas towers," or radar stations on man-made islands on Atlantic shoals extending from northern New England to the Virginia capes, was also constructed.

Personnel.—Continuing the build-up to the programed goal of 137 wings by 1957, the USAF had by December 1955 reached a strength of 951,000 personnel (143,000 officers and 808,000 airmen) in 127 wings, with 24,000 combat aircraft. Air force civilian strength on this date was 406,000.

The air force continues to stress the Reserve and Air National Guard as essential components of the ready air force which would be required for immediate action in the event of an international emergency. To this end, the air force has revitalized the Reserves by encouraging or requesting the retirement or resignation of officers not actively participating in training. It has also pushed the activation of Reserve units and regular participation by the members thereof and the re-equipping of all reserve units with jet combat aircraft. By the end of October 1955, the U.S. Air Force Reserve (24 wings) had an assigned strength of 262,300 men, which shows an increase of about 2,700 men a month for the

past year and a half. The strength of Air Force Reserves on pay status showed more than a 100 per cent increase from 23,000 to 54,200. By the end of October the Air National Guard (27 wings) had reached 63,200, including 6,850 officers.

U.S. Air Force Academy.—On July 11, 1955, the U.S. Air Force Academy was dedicated at the temporary site at Lowry Air Force Base, Denver, Colo., and some 300 cadets were sworn in as the first class. Work at the permanent site of the academy, near Colorado Springs, Colo., scheduled for completion by 1958, was begun with an appropriation of \$27 million by Congress.

Flight Records.—A number of new records were established in 1955. In February, a B-47 set a new nonstop transcontinental speed record, in a 2,090-mile flight from Riverside, Calif., to Savannah, Ga., in 3 hours 19 minutes 35 seconds at an average speed of 622.88 miles per hour. A Republic F-84F made the longest nonstop flight by a jet fighter bomber without refueling—2,390 miles from California to Virginia in 3 hours 55 minutes at an average speed of 605 miles per hour. In March, the air force broke its year-old speed record for the Los Angeles-New York course (2,445 miles) when an F-84F made the nonstop flight in 3 hours 46 minutes 33 seconds at an average speed of 652.5 miles per hour, with two mid-air refuelings.

In May, four F-84 Thunderjets completed a routine nonstop flight of 2,840 miles from Tokyo, Japan, to Newcastle, Australia, in 12 hours 2 minutes, with mid-air refueling. Also in May, an Air National Guard pilot, Lieut. John M. Conroy, flying alone in an F-86 Sabrejet, made air force history on a coast-to-coast round trip. In little more than 11 hours, the pilot breakfasted in Los Angeles, lunched in New York, and returned to Los Angeles for dinner; the return trip was made in 5 hours 27 minutes 37 seconds, breaking the former east-to-west flight record by almost two hours. In-flight refueling was used.

In August, ten F-84F jet Thunderstreaks set two new world's records, one for time, one for nonstop mass flight distance, by flying 5,118 miles from England to Texas in 10 hours 48 minutes, at an average of 480 miles per hour. In-flight refueling was again used. Also in August, an F-100C Super-Sabre set the world's first speed record for straightaway supersonic flight—just over 822 miles per hour, or 1.23 times the speed of sound.

History's biggest troop airlift—the "swapping" of more than 7,000 army paratroopers between the United States and Japan—took place between July 7 and July 17, 1955. The 18th Air Force performed "Operation Gyroscope" with giant C-124 Globemasters conveying the 508th Airborne Regimental Combat Team from Fort Campbell, Ky., to Ashiya Air Base, Japan, and returning the 187th Airborne Regimental Combat Team to Fort Bragg, N.C.

Administration.—The appointment of Donald A. Quarles (q.v.), for the past two years assistant secretary of defense in charge of research and development, to succeed Harold E. Talbott as secretary of the air force, was announced on Aug. 11, 1955; Mr. Quarles was sworn into office on August 15. In June 1955, Gen. Nathan F. Twining was reappointed for a second term as chief of staff, U.S. Air Force.

¹ Special census, 1955; ² Special census, 1954.

Executive.—Chief state officers in 1955:

Governor: James E. Folsom (Democrat)

Lieutenant Governor: W. Guy Hardwick

Secretary of State: Mary Texas Hurt

Treasurer: John Brandon

Attorney General: John M. Patterson

Superintendent of Education: Austin R. Meadows

Constitution and Judiciary.—The present constitution was adopted in 1901. The Supreme Court comprises seven justices; chief justice in 1955 was J. Ed Livingston.

Legislature.—The legislature (Senate, 35 members; House of Representatives, 106) convenes in regular session in odd-numbered years on the first Tuesday in May.

In a special session held during April, a \$50 million program of rural road construction, to be supervised by a new highway authority, was adopted. Bonds for the project were to be financed from a one-cent increase in gasoline and diesel fuel taxes. Other legislation increased the franchise tax on out-of-state corporations doing business in Alabama from \$2 to \$2.50 on each \$1,000 of assets invested in the state; increased taxes on insurance company premiums; and approved additional taxes on cigarettes, beer, and whisky—all of which were to finance an old-age pension system.

During the regular session (May 3 to September 2), the lawmakers passed a new school placement law giving city and county school boards almost unlimited power in assigning both white and negro children to schools, regardless of their home address (see also below, **PRINCIPAL EVENTS**, 1955).

Finances.—Treasury receipts (fiscal year ending Sept. 30, 1954): \$451,071,272.89; expenditures, \$454,863,631.15; treasury balance, \$46,818,452.71; long-term indebtedness, \$61,287,000.

Taxation.—State tax revenue (1955 fiscal year): \$163,205,000, including \$119,443,000 from a 3% general sales tax and selective sales and gross receipts taxes; \$14,093,000 from licensing; \$17,556,000 from individual and corporate income taxes; and \$9,681,000 from property taxes. There is also a \$1.50 poll tax.

Banking.—As of June 30, 1955, the state's 71 national banks had \$1,215,318,000 in assets, \$880,824,000 in demand deposits, and \$233,863,000 in time deposits; the state's 164 other banks and 3 branches had \$427,866,054.71 in assets, \$278,681,222.85 in demand deposits, and \$109,541,173.04 in time deposits.

Education.—School attendance is compulsory for all between the ages of 7 and 16, inclusive. Operating expenditures for public elementary and secondary education in the 1953-54 fiscal year comprised (including a balance from 1952-53): \$21,504,590 from local school districts; \$69,363,034 from the state; and \$2,137,323 from the federal government. Per capita cost per pupil was \$135.22. Expenditures for construction and improvements totaled \$12,481,651. Salaries of all teachers averaged \$2,729 (of high school teachers, \$2,872; elementary school teachers, \$2,628).

ALABAMA SCHOOL STATISTICS: 1953-54

Type of school	No.	Teachers	Students
Public elementary (1-6).....	13,351	448,970

Prison camps (Sept. 30, 1955)	31	1,594

Labor Force.—The state's labor force (July 1955) numbered 1,166,000, including 271,000 agricultural workers. Nonagricultural employment in July 1955 was 839,400, and for the 12 months ending June 30, 1955, averaged 831,500. There were 55,600 unemployed workers in July 1954, and \$15,835,041 in unemployment insurance claims was paid to insured workers during 1954.

Manufacturing.—Establishments numbering an estimated 4,000 in 1954 had 225,700 employees. Investment in new plant and equipment in 1953 totaled \$98,571,000. Weekly earnings of production workers in manufacturing averaged \$55.91 for an average work week of 39.1 hours in 1954 and \$60.49 for 40.6 hours in the first six months of 1955.

Mining.—Alabama normally stands second among the states in production of bauxite, and third in output of iron ore. In 1953 it was the third largest graphite producer. In that year it stood 18th in the value of its mineral output with 1.31% of the United States total.

Fisheries.—The commercial catch of salt and brackish water species was valued at \$2,200,000

for the year ending Sept. 30, 1955, including principally 37,366 barrels of shrimp (\$1,212,395). The fresh-water catch for the year ending June 30, 1954, was valued at \$830,825, principally 2,217,600 pounds of catfish (\$620,928).

Forestry.—Pulpwood production in 1954 totaled 1,831,889 standard cords, including 1,764,912 of pine and 66,977 of hardwood. Six companies were drawing pulpwood from the state in 1954. Other output (1953) included 1,064,531,000 feet of pine lumber, 542,834,600 of hardwood lumber, and 37,613.8 barrels of crude turpentine.

Agriculture.—Cash farm income in the first half of 1955 totaled \$121,784,000, and for the full year 1954 comprised \$187,114,000 from livestock and livestock products, \$209,166,000 from crops, and \$5,499,000 from government payments. Receipts from livestock and livestock products in 1954 included: cattle, \$51,448,000; hogs, \$49,453,000; broilers, \$32,653,000; and dairy products, \$30,423,000.

The state's 176,956 farms (20,810,492 acres; harvested cropland, 4,812,086) had an average of 117.6 acres and \$6,230 in value of land and buildings per farm in 1954. Livestock on farms (Jan. 1, 1955) included 1,804,000 cattle, 1,097,000 hogs, and 7,605,000 chickens (not including commercial broilers). During the week of Oct. 24-30, 1954, there were 302,459 family and hired workers engaged in farming. There were 28,138 farms with telephones; 155,123 with electricity.

Transportation and Communications.—State and federal funds disbursed for roads and highways in the 1954-55 fiscal year totaled \$89,200,000, and newly completed construction and reconstruction aggregated an estimated 1,200 miles.

Highways and roads on Dec. 31, 1954, totaled 62,241 miles (16,534 paved and 29,392 soil-surfaced or graveled). Registered *motor vehicles* numbered 876,670 on Sept. 30, 1954, including 684,507 passenger cars. There were 28 *railroads* (1955) which, in 1953, operated 4,675 track miles, and (1955) 5 regularly scheduled *airlines* and 118 *airports and airfields* (59 commercial and municipal, 15 military, 6 private, and 38 other).

Communications media in 1955 included 95 AM and 15 FM *radio stations* and 10 operating *television outlets* (8 VHF and 2 UHF); 21 daily *newspapers* (circulation, 700,858) and 124 other newspapers; and (Jan. 1, 1955) 149,647 business and 396,717 residential *telephones*.

Principal Events, 1955.—Educational developments dominated much of Alabama's news in 1955. A large and representative group of Alabamians met at the University of Alabama's Medical Center in Birmingham on May 22 for the inauguration of the center's first vice president. At

the end of its spring quarter, Alabama Polytechnic Institute granted its first doctoral degrees.

A federal judge in Birmingham ruled on June 29 that the University of Alabama could not refuse enrollment to two Negro women because of their racial origin. Two days later he held that the university had to admit all scholastically qualified Negroes. The U.S. Supreme Court on October 10 backed up the earlier decree by ordering the university to admit the Negro women.

Gov. James E. Folsom refused to sign a school placement bill passed by the legislature, but it automatically became law anyway on the governor's declining either to veto or approve it. The measure seeks to preserve separate schools for white and Negro students by giving local school boards discretionary power to determine where each pupil must attend school. The enactment does not apply to the state's higher educational institutions.

The Alabama Methodist Conference in 1955 approved a resolution asking the Methodist General Assembly not to pass any legislation that would interfere with the policy of maintaining separate racial customs in churches, schools, colleges, assemblies, and conferences within the Methodist Church.

Places in the news during 1955 included Huntsville, which celebrated its 150th anniversary; Point Clear, scene of the Southern Governors' Conference; and Citronelle (Mobile County), near which Alabama's first deep oil well went into production in October.

Principal Events by: GLADSTONE H. YUEVELL,
Professor and Chairman, Department of
History and Philosophy of Education,
University of Alabama.

ALAND (or AALAND) ISLANDS (Finn. AHVENANMAA). An archipelago of some 6,500 islands and reefs (50 inhabited) in the Baltic Sea at the entrance to the Gulf of Bothnia. Area, 581 square miles, of which Åland, the largest island, comprises 285. The population (est. 1953, 21,400) is Swedish-speaking. Maarianhamina (Mariehamn, pop., 3,264) is the capital and chief city. The islands form an autonomous department of Finland and have an elected county council and an executive council. Chief industries are fishing and shipping. Crops include rye, barley, flax, and vegetables.

ALASKA. Largest territory of the United States, Alaska is bounded on the north by the Arctic Ocean, on the east by Canada, on the south by the Pacific Ocean, and on the west by the Bering Sea, Bering Strait, and the Arctic Ocean. The territory was acquired by purchase from Russia in 1867.

Area and Population.—Area: 586,400 square miles (land, 571,065; inland water, 15,335). Estimated total population (July 1, 1953): 222,100, including seasonal workers and 49,000 military personnel; estimated civilian population (Jan. 1, 1954): 151,900. The 1950 census population of 128,643 included 33,863 Eskimos, Indians, and Aleuts. Alaska has 29 incorporated towns and cities, principal of which (with 1950 census figures) are: Anchorage, 11,254; Juneau, the capital, 5,965; Fairbanks, 5,771; and Ketchikan, 5,305.

Executive.—Chief territorial officers in 1955 included B. Frank Heintzleman, governor, and Waino Hendrickson, secretary of Alaska, both appointed by the president of the United States and confirmed by the Senate. Other officials included Hugh Wade, treasurer; J. Gerald Williams, attorney general; John A. McKinney, director of finance; Karl F. Dewey, tax commissioner; and Donald Dafoc, commissioner of education.

Judiciary.—There is a federal district judge for each of the four judiciary districts. United States commissioners act as lower-court magistrates, and United

States marshals and district attorneys serve as law-enforcement officers.

Legislature.—The Territorial Legislature comprises a 16-member Senate and a 24-member House of Representatives, both popularly elected. The legislature meets in odd-numbered years commencing on the fourth Monday in January for a session of 60 legislative days. Alaska is represented in the U.S. House of Representatives by a nonvoting delegate (Edward L. Bartlett, a Democrat, in 1955).

Finances.—In the 1954 calendar year, treasury receipts totaled \$33,685,572.82; expenditures, \$35,506,725.35. On Dec. 31, 1954, the net treasury balance was \$10,288,369.42.

Taxation.—Revenue from taxes in 1954 totaled \$14,591,561.03, of which \$6,057,351.72 was obtained as Alaska's share of locally paid federal income taxes. Other sources were gross receipts taxes, \$1,424,799.42, and licensing, \$1,307,791.39.

Banking.—On June 30, 1955, Alaska's 18 banks, including six national banks, held assets of \$157,568,565.68, demand deposits of \$92,475,436.68, and savings deposits of \$54,926,904.82.

Education.—School attendance is compulsory for all between the ages of 6 and 16, inclusive, who have not completed the eighth grade. Operating expenditures for public elementary and secondary education in the 1953-54 school year totaled \$8,444,760.96 (cost per pupil, \$414.22); and teachers' salaries averaged \$5,300.

^{*}Teaching in or registered for the regular campus sessions.

In addition, the Alaska Native Service in 1953-54 operated 86 day schools and two boarding schools for 5,000 native students in grades 1 through 12.

Social Welfare.—Expenditures for social welfare in 1953-54 totaled \$10,362,855, including \$1,209,169 in old-age assistance to a monthly average of 1,667 persons; \$37,166 in aid to a monthly average of 52 blind persons; \$907,141 for dependent children; and \$111,704.50 for general relief.

Principal territorially maintained institutions include 9 tuberculosis units, of which 3 are separate and 6 are located in the territory's 25 general hospitals. Epileptics, the mentally ill and deficient, and persons sentenced to prison terms are sent to the United States mainland for treatment or confinement.

Labor Force.—On Aug. 5, 1955, Alaska's labor force numbered 80,350, including 650 agricultural workers. Nonagricultural employment was 75,060 on the same date, and unemployed workers totaled 5,285 on Aug. 15, 1955, compared with 6,108 a year earlier. Alaska paid \$8,027,324 in unemployment compensation claims for the year ending June 30, 1955.

Manufacturing.—There were 286 manufacturing establishments in Alaska in 1955, employing an average of 4,476 persons and paying \$23,307,000 in wages. Leading manufactures (with figures for the year ending March 31, 1955) include food processing, mostly fish canneries, employing 3,723 persons and paying \$13,644,729 in wages; pulp and wood products and lumber (1,225; \$8,119,225), printing and publishing (323; \$1,756,153); fish oil reduction; and ship and boat building and repairs.

Mining.—Mineral production in 1954 was valued at \$24,328,000 and employed 2,000 persons as of Sept. 1, 1954. Alaska outranked any of the

states of the Union in tin and platinum output and stood third in gold production.

Silver (fine ounces).....	35,140	31,803
Other.....		1,231,003

Fisheries.—Valued at \$31,251,041, the commercial fisheries catch during 1954 totaled 337,-628,720 pounds. There were 23,079 persons employed in the industry, of whom 12,444, using 6,499 vessels and boats, were actually engaged in fishing. Total landings of salmon in 1954 were 247,032,557 pounds (\$24,597,049); of other fish, 76,227,409 pounds (\$5,172,777); and of shellfish, 14,368,754 pounds (\$1,481,215). (See also below, *Principal Events, 1955.*)

Fish products prepared for market in 1954 by Alaska's 186 wholesale and processing establishments (employing 8,980 persons) totaled 222,-377,520 pounds valued at \$77,879,446. Included were 174,484,964 pounds of salmon (\$68,206,-971); 27,345,889 pounds of halibut (\$4,477,-799); and 2,857,599 pounds of crabs (\$2,994,518). Fur seal pelts are taken from Alaska's Pribilof Islands (q.v.).

Forestry.—Alaska's Chugach and Tongass national forests cover 20,777,294 acres and have an estimated commercial stand of 84,760 million board feet. Timber cut and scaled from these forests in the 1953-54 fiscal year totaled 70,283,-000 board feet, valued at \$224,588.

Agriculture.—Cash farm income in 1953 totaled \$2,819,836, of which dairy products accounted for \$1,016,877; vegetables, \$1,155,949; poultry, \$350,936; and beef, pork, lambs, and wool, \$142,444. Production is largely centered in the Anchorage area and the Matanuska Valley.

In 1953, some 1,400 persons worked the approximately 8,000 acres under cultivation on Alaska's 500 farms. Farms covered 421,799 acres (1950) and had an estimated 1953 value of \$7 million in land and buildings.

Transportation and Communications.—Territorial and federal funds spent for roads and highways in the 1954-55 fiscal year totaled \$15.2 million, and newly completed construction aggregated 106.4 miles.

Highways and roads in July 1955 totaled 3,860 miles (950 surfaced), and on Dec. 31, 1954, registered motor vehicles numbered 56,062, including 39,388 passenger cars.

The transport of passengers and mail is largely by air service, with airlines carrying more than half of the persons traveling between the United States mainland and Alaska. Alaska, Northern Consolidated, Pacific Northern, Cordova, and Northwest airlines operate flights from the Anchorage International Airport; and Pan-American Airways and Northern Consolidated, Alaska, Wien Alaska, and Canadian Pacific airlines operate from Fairbanks.

Other transport is furnished by 2 railroads, operating 509 miles of single track in 1954, and several American and Canadian steamship lines regularly serving Alaska and its 18 customs ports and stations (1954).

Communications media in 1955 included 24 AM radio stations, 3 operating television outlets, 7 daily newspapers, and 10 other newspapers. The Alaska Communication System, established in 1900 as a function of the U.S. Army Signal Corps, handles military communications within Alaska and processes all commercial telephone, radio, and telegraphic communications within and to and from Alaska. Some 248 post offices are scattered throughout the territory.

Principal Events, 1955.—Although statehood for Alaska in 1955 was defeated in the 83d Congress,

the Territorial Legislature authorized a constitutional convention to be convened in Fairbanks beginning on Nov. 8, 1955, and to extend a maximum of 75 days. Fifty-five delegates were elected.

The year 1955 experienced the lowest salmon pack (only 2,386,676 cases) in Alaska in 46 years. Drastic measures were planned to be taken in the 1956 season to prevent destruction of the industry—which seems imminent owing to over-fishing.

An important discovery of uranium ore made on Prince of Wales Island in Moira Sound, west of Ketchikan, in the spring of 1955 promised a new Alaskan industry. The ore averaged from 4% to 5% uranium.

Probably the most significant industrial development in Alaska in 1955 was the sale of 7.5 billion board feet of timber by the U.S. Forest Service to the Georgia-Pacific Plywood Company. The timber, which will bring more than \$15 million stumpage, is located principally on Admiralty Island, near Juneau. The company will construct a huge paper mill in the vicinity of Juneau. Earlier the Pacific Northern Timber Company of Wrangell, Alaska, and Portland, Oreg., purchased 3 billion board feet of timber in the Wrangell area. The firm will be required to have a sawmill of 40 million board feet annual capacity in operation by Dec. 31, 1957, and a pulp mill by 1962. Bids were open in November 1955 for the sale of 5¼ billion board feet of timber in the Sitka area on Jan. 25, 1956. Plans call for a pulp mill in that vicinity with a 500-ton daily capacity.

Petroleum research was still continuing in Alaska in 1955. Eight major companies and numerous smaller ones were active in exploration work in the various favorable localities.

On Oct. 12, 1955, the \$40 million, 626-mile Alcano Pipeline, connecting Haines and Fairbanks, was formally turned over to the Alaskan Command of the U.S. Army. Placed in full operation a month earlier, this multiple fuel pipeline is regarded as the most spectacular project of Alaska's defense construction program.

Library and Museum, Juneau.*

ALBANIA. A country of the Balkan Peninsula, Albania is bounded on the west by the Adriatic Sea, on the north and east by Yugoslavia, and on the south by Greece. It has an area of 10,629 square miles and a population (est. mid-1954) of 1,260,000. The principal cities, with their 1952 population estimates, are Tiranë (Tirana), the capital, 63,000; Shköder (Scutari), 30,000; Korçë (Koritsa), 28,000; Elbasani, 18,000; Gjinokastër (Gjorokastron), 12,000; Berati, 11,000; Vlonë (Valona), 10,000; and Durrës (Durazzo), 9,000.

Government.—Since Jan. 11, 1946, Albania has been a people's republic, controlled by the Communist Party, which is called officially the Albanian Workers' Party. In 1948, when Yugoslavia's Communists were expelled from the Cominform, the Albanian government remained loyal to the Soviet Union, thereby losing Yugoslav support, which had been instrumental in establishing the regime in the wake of World War II. There has, however, been an easing of tension since the Soviet attempt to restore the old ties of friendship with Yugoslavia through the visit of Nikolai A. Bulganin and Nikita S. Khrushchev to that country on May 26-June 3, 1955.

The constitution now in force was adopted on March 7, 1946, and amended on July 4, 1950. According to its provisions, all Albanian citizens, male and female, who have completed their 17th year are eligible to vote. The 121 deputies whom they elect constitute the People's Assembly, which is the sole legislative body and serves for a period of four years. The assembly in turn

elects the Presidium of the People's Assembly, which consists of a president, two vice presidents, a secretary, and seven members. The president, who is equivalent to a chief of state, is Hadji Lechi. The cabinet, which is appointed and dismissed by the assembly, is presided over by Premier Mehmet Shehu. Enver Hoxha, founder of the Communist regime, is first secretary of the Central Committee of the Albanian Workers' Party and president of the Democratic Front, which is the wartime National Liberation Front and the outer organization of the Communist Party.

Education, Press, and Radio.—The school system is completely under the control of the government. Elementary education, which lasts seven years, is compulsory. In 1953 there were 2,150 elementary schools with 162,500 pupils. Secondary schools, numbering 390 with 80,250 students in 1953, exist in the chief towns. Higher education is offered in three institutes, devoted respectively to pedagogical, agricultural, and industrial studies, and a medical school; in 1953 they had an estimated combined enrollment of 1,500.

Adult education is encouraged as a means of combating illiteracy and of promoting the ideas and plans of the government. An evening "university" in Tiranë with a two-year curriculum offers special training in Marxism-Leninism. In the fall of 1954 the Museum of V. I. Lenin and J. V. Stalin was opened in Tiranë as another center of Communist schooling. *Pravda*, which published this information on June 16, 1955, also stated that over 1 million copies of the works of Karl Marx, Friedrich Engels, Nikolai Lenin, and Joseph Stalin had been sold in Albania in Albanian translation.

The daily and periodical press is controlled and subsidized by the government. Radio Tiranë, the national broadcasting station, is also in the service of international communism.

Religion.—The constitution guarantees freedom of religion, but in reality it is supervised and directed by the government, to whose interests the church is subservient. The population consists of Moslems (66%), Greek Orthodox (23%), and Roman Catholic (11%). A considerable part of the Moslem community is affiliated with the dervishes (monks) of the Bektashi order. In 1951 the Catholic Church of Albania was declared independent of the Vatican, while the Orthodox Church was placed under the authority of the patriarch of Moscow and all Russia.

Finance.—The 1955 national budget, approved by the People's Assembly on April 1, called for revenues of 12.3 billion leks (50 leks = U.S.\$1) and expenditures of 11.6 billion. Leading items of expenditure were 4,575 million leks for the national economy, 2,162 million for cultural and social purposes, and 1,410 million for the armed forces.

Economy.—Albania's principal agricultural products are livestock, grain, eggs, butter, wool, hides, and timber, while her chief minerals are lignite and aluminum. According to the First Five-Year Plan (1951–55), the number of cattle and buffaloes was to increase from 129,000 in 1950 to 139,000 by the end of 1955; sheep, from 1,707,000 to 1,844,000; and goats, from 830,000 to 847,000. Sugar beet production was scheduled to rise from 6,000 to 100,000 metric tons.

Major emphasis is placed on industrial and mineral resources. Production of important items in 1953, with 1955 planned output in parentheses, is as follows: cotton textiles, 50 million square meters (21.5 million); refined sugar, 7,560 metric tons (11,000); petroleum, 341,000 metric tons (263,000); chrome ore, 55,000 metric tons (120,000); and copper ore, 50,000 metric tons (145,000). It was also planned to increase the production of lignite from 28,300 metric tons in 1950 to 168,300 in 1955; that of coal from 42,000 to 250,000 metric tons, cement from 15,000 to 58,000 metric tons, timber from 51,000 to 82,000 cubic meters, and electric power from 21,000 to 121,000 kw.

It is not known whether any of the 1955 goals have been reached, but on June 24, 1955, the government published in *Pravda* a report of percentages attained in some areas of production as compared with the 1954 level. This stated that there was a 26% increase in cereals, 87% in cotton, 65% in tobacco, 102% in sugar beets, 50% in potatoes, 66% in the number of machine tractor stations, 83% in the number of tractors in operation, and 127% in the number of combines.

The area under cultivation rose by 18,690 hectares during the year. Despite these impressive figures, however, there has been unemployment and a nationwide shortage of consumer goods, especially food and wearing apparel.

Principal Events, 1955.—On March 4, President Dwight D. Eisenhower offered to send free food to Albania through the League of Red Cross Societies, to meet current shortages in food supplies. The offer was rejected three days later with slanderous expressions in the Albanian press and radio. The motives of the United States were denounced in *Pravda* as "imperialistic" and "insincere."

At the same time, the dependence of Albania on the USSR became more conspicuous. There was a new influx of Soviet advisers in 1955, as well as missions from other Communist countries. Enver Hoxha, speaking in June at the Third Congress of the Democratic Front, stressed the "peaceful intentions" of Albania and her favorable reaction to Soviet-Yugoslav friendship.

On Dec. 2, 1954, Albania signed in Moscow a defense pact with the USSR, Poland, Czechoslovakia, Rumania, Bulgaria, Hungary, and East Germany. On May 14, 1955, the signatories of this pact concluded at Warsaw, Poland, a treaty of friendship, collaboration, and mutual aid. The Albanian delegation to the Warsaw Conference was composed of Premier Mehmet Shehu, Deputy Premier and Defense Minister Bekir Balluku, and Foreign Minister Behar Shtylla.

Following the Soviet example, the Albanian government announced on Sept. 3, 1955, its decision to reduce its armed forces by 9,000 by December 31. The discharged men would be employed in agriculture and industry. After the decrease, the number of men in the armed forces would total about 50,000.

There were several attempts to improve relations with Western nations. On March 18, 1955, the Albanian government declared the termination of the state of war with Germany. Then, on July 7, it was announced in Rome that Italy and Albania had concluded negotiations providing for the settlement of reparations payments due Albania under the 1947 peace treaty at \$2,600,000, chiefly in capital goods.

Attempts were also made to resume normal relations with Greece. On July 2, the Albanian government announced that it had requested the U.N. Secretariat on June 30 to assist it to this end. Although Greece agreed on August 3 to resume relations under certain conditions, Albania rejected the Greek offer on August 14.

On December 14, Albania, along with 15 other countries, was elected to membership in the United Nations.

G. G. ARNAKIS,
Visiting Professor of History,
University of Texas.

ALBERTA. Covering an area of 255,285 square miles, of which 6,485 square miles are water, Alberta is the fourth largest of the ten Canadian provinces, and is the most westerly of the three Prairie provinces. It is bounded by Saskatchewan on the east, British Columbia on the west, Montana on the south, and the Northwest Territories on the north.

Population.—The population (1955 est.) totals 1,050,000 (1951 census, 939,501), and by national origin is 48% British, 17% American, 11% German, 9% Ukrainian, 7% Scandinavian, and 5% French. Principal urban centers (with estimated 1955 populations) are Edmonton, the capital (209,353), Calgary (168,840), Lethbridge (28,300), Medicine Hat (20,000), Red Deer (11,688), and Camrose (6,100).

Government.—A lieutenant-governor (John James Bowlen in 1955) is appointed by the Canadian government to administer the province; he is advised by a Legislative Assembly of 61 members, 13 of whom form the Cabinet or Executive Council. Ernest C. Manning served as premier in 1955. The Social Credit Party, which has been in power since Aug. 22, 1935, was returned with a majority of 24 members at the general election of June 29, 1955. The province is represented in the Canadian Parliament by 17 members elected to the House of Commons, and by 6 appointed senators.

Education.—There are 3,811 school districts grouped in 58 school divisions or counties; in addition, there are 179 city, town, and separate school districts. Classrooms numbered 6,946 and school enrollment totaled 210,000 in 1955. The Department of Education also maintained a correspondence school branch with an enrollment of 8,000 pupils for the benefit of those without organized school facilities in Alberta and the Northwest Territories. There are 56 recognized private schools. Teacher training is supervised by the faculty of education at the University of Alberta at Edmonton; the university offers degree courses in the sciences and arts. The Provincial Institute of Technology and Art is located at Calgary, and schools of agriculture are administered by the Alberta government at Olds, Vermilion, and Fairview.

Religion.—The United Church of Canada comprises Alberta's largest religious group, followed by the Church of England in Canada (Anglican), Roman Catholic, and Eastern Orthodox communions. Lutherans, Presbyterians, Baptists, and Mormons also are represented.

Finance.—Revenue for the fiscal year which ended March 31, 1955, was \$151,973,865; estimated revenue for the fiscal year 1955–56 was \$171,875,115. The total debt as of Dec. 31, 1954, was \$91,185,211, representing a reduction of more than \$75 million since 1936. A debt reorganization program provides for the retirement of all debt by 1973.

Production.—Agriculture is Alberta's most important industry, although the value of manufacturing production is currently equalling the value of agricultural production. Production of major crops in 1954 included: wheat, 95,000,000 bushels; oats, 74,000,000 bushels; barley, 70,000,000 bushels; potatoes, 1,900,000 bushels; and sugar beets, 440,000 tons. Livestock marketings for 1954 totaled 749,976 sheep and lambs, and 2,046,079 hogs.

Petroleum production in 1954 totaled 87,713,855 barrels, representing 92% of Canada's total oil production. In 1954, 135 billion cubic feet of natural gas was produced.

The total value of mineral production in 1954 was \$281.5 million. Coal reserves are estimated at 47,874,300,000 tons; in 1954, coal production totaled 4,859,136 tons. There are large salt deposits at Lindbergh and McMurray in northern Alberta.

Production of lumber in 1954 amounted to 354,000,000 board feet, valued at \$17,761,000. Alberta lakes abound in whitefish, trout, perch, pike, tulibee, and pickerel. Commercial fishing in 1954 yielded 7,807,500 pounds of fish valued at \$1,168,000.

Manufacturing.—Alberta is benefiting from industrial expansion. During 1954, 90 firms established operations in the province, representing an investment of approximately \$94 million and providing new jobs for 2,300 persons. Foods and beverages provide the largest share of manufacturing production, followed by petroleum and coal products, wood products, iron and steel products, and chemicals. Petrochemical production is being developed on a large scale at Edmonton, Calgary, Fort Saskatchewan, and Medicine Hat. Calgary is a prominent battery manufacturing center, while three sugar refineries in southern Alberta produce more than a million pounds of sugar annually. Meat packing is the most important single manufacturing industry. Recent industrial developments include a \$30 million pulp mill being built at Hinton, west of Edson, steel mills at Edmonton, and a large chemical fertilizer plant constructed at Medicine Hat.

Trade and Commerce.—Lumber products are sold in Canada and the United States, and fish are exported to Chicago. Coal is sold mainly to the western provinces of Canada. Alberta is supplying 43,800,000 cubic feet of natural gas to the Anaconda Mining Company of Montana over a 5-year period (1951–56). In March 1955, the Interprovincial Pipeline was carrying about 134,000 barrels of crude oil daily to Saskatchewan, Manitoba, Wisconsin, and Ontario refineries; and the Trans Mountain Oil Pipeline was transporting 77,000 barrels of oil daily from Alberta to Vancouver. Plans are being made to export natural gas to eastern Canada, British Columbia, and the Pacific Northwest of the United States.

Transportation and Communication.—Alberta is served by three railway systems—the Canadian National, Canadian Pacific, and Northern Alberta Railways. There are 5,085 miles of railroad and 29,860 miles of graveled and surfaced highway. The province is on the air route to the Orient, and from Edmonton there is much air transportation into northern Canada. Canadian Pacific, Trans-Canada, Northwest, and Western Airlines serve the province. The telephone system is owned and operated by the province, except at Edmonton and Banff. Certain rural telephone lines are operated by mutual companies.

Principal Events, 1955.—Alberta, which became a province on Sept. 1, 1905, celebrated its golden jubilee during the year with enthusiastic provincial and local programs.

Two members of the legislature resigned their seats when it was revealed that they were part-owners of an Edmonton building rented to the provincial government. They were later re-elected in the provincial general election of June 29, which returned the Social Credit Party to the government but with a decreased majority.

In the most tragic mountaineering accident in Canadian history, seven young Americans were swept to death by an avalanche while attempting an ascent of Mount Temple, a 11,636-foot peak in Banff National Park, on July 11. Two other boys of the party of 11 were injured.

A. R. PATRICK,
Minister of Economic Affairs.

ALCOHOL. See Index entry.

ALCOHOLIC BEVERAGES. See BREWING INDUSTRY; DISTILLING INDUSTRY; WINE.

ALEUTIAN ISLANDS. A chain of islands extending some 1,200 miles westward from the Alaskan mainland, politically part of Alaska. Area, 6,821 square miles; pop. (1950 census), 5,600. Chief island groups are the Fox Islands, Andreanof Islands, Rat Islands, and Near Islands. United States airbases are at Shemya, Adak, and Cold Bay. The airport at Shemya is used by commercial lines in the northern route to the Far East. The natives, an Eskimo group known as Aleuts, number fewer than 700.

ALGERIA. A French territory on the Mediterranean coast of Africa. Area, 846,124 square miles (including about 695,000 of desert); pop. (est. Oct. 31, 1954), 9,530,486, chiefly Moslems (Kabyles, Berbers, and Arab Bedouins). The European population, mainly French, totals about 1,029,000, including over 100,000 native Jews. Chief cities and populations (1954): Algiers, the capital, 355,000 (including 162,000 Moslems); Oran, 292,000; Constantine, 144,000; and Bône, 112,000. French is the official language, although the Moslems speak mainly Arabic.

Government.—Algeria comprises 4 French overseas departments—Alger, Oran, Constantine, and Bône (created a department in 1955)—and the sparsely populated Southern Territories (under semimilitary administration). The head of the government is the French-appointed governor general, who is under the French minister of interior. Jacques Soustelle was appointed governor general on Jan. 26, 1955, succeeding Roger Léonard, who had served since 1951. The Algerian Assembly is elected for 6 years and consists of 60 representatives of the first electoral college (Europeans and qualified Moslems) and 60 of the second (the Moslem majority). The Assembly's powers are limited and are mainly in the field of finance. Algeria sends 30 deputies (15 Europeans and 15 Moslems) to the French National Assembly in Paris.

Education.—The proportion of Moslem children attending school is small, and illiteracy among the Moslems is widespread. In 1953-54 there were 2,369 primary schools (410,627 pupils) and 44 secondary schools (31,196). The University of Algiers had 5,149 pupils. There are also several normal schools, vocational schools, and Moslem higher schools.

Finance.—Estimates of the 1953-54 budget (including the extraordinary budget) were: revenue, 110,629 million francs; expenditure, 110,363 million. The Algerian franc is equal to the metropolitan franc.

Production.—About three fourths of the population is engaged in agriculture. The fertile areas along the coast are owned mostly by Europeans. Moslem farmers are chiefly smallholders or tenants, employing primitive techniques. Output of chief cereal crops in 1954 was (in bushels): wheat, 44.8 million; barley, 37.2 million; and oats, 7.6 million. Wine exports totaled 1,473,000 metric tons in 1954. Production of citrus fruits in 1954-55 was 10.9 million boxes; olive oil, 30,000 short tons; wool (prelim. 1954), 26 million pounds (greasy basis); and tobacco (prelim. 1954), 40.6 million pounds. Dates, figs, pulses, esparto grass, livestock products, and cork are also produced.

Chief industries are wine making, tobacco products, silk spinning, metallurgy, chemicals, glass, construction materials, foodstuffs, and textiles. The index of industrial production (base: 1948 = 100) rose from 137 in 1953, to 149 in 1954. Electricity output totaled 826.8 million kw.-hr. in 1954, a rise of 7% over 1953. A 5-year (1955-59), \$77 million, power expansion program will add 135,000 kw. to existing capacity. Chief minerals, with 1954 output in metric tons, are: iron ore (55% metal content), 2,922,900; phosphates, 758,000; iron pyrites, 33,500; barites, 13,600; zinc ore, 50,100; lead ore, 15,000; and coal, 303,000.

Foreign Trade.—Exports in 1954 totaled 140,279 million francs; imports, 217,724 million. Wine, the chief export, had a value of 56,875 million francs; iron ore, 10,909 million. In exchange for its agricultural products and minerals, Algeria obtains chiefly agricultural machinery, petroleum products, sugar, textiles, and other manufactures, foodstuffs, and raw materials. France took 73% of Algeria's 1954 exports and provided 79% of imports.

Transportation and Communications.—Algeria has 2,805 miles of railroads (1953) and 9,087 miles of surfaced highways (1952), supplemented by local and rural roads. Main airfields are at Algiers, Oran, and Bône. Passenger cars numbered 86,600 in 1955; telephone subscribers, 70,380 (1953); radio sets, 255,000. In 1952, Algeria had 11 daily newspapers with a total circulation of 260,000.

Principal Events, 1955.—The outbreak of violence by guerrilla nationalists in November 1954 took on the proportions of a serious rebellion in 1955. The guerrillas, operating in small bands based mainly in the rugged Aurès Mountains, termed themselves the National Liberation Army and were led by the National Liberation Front. Guerrilla effectives reportedly numbered only a

UNITED PRESS

Captured Algerian terrorist suspects are brought to a base camp by French Foreign Legionnaires during nationalist revolt in September 1955.

few thousand. Because of the nature of their operations and the inaccessibility of their bases, however, more than 100,000 French troops plus colonials and paramilitary formations were engaged in their suppression. The guerrilla actions, which spread during the year to the Kabylia coastal region east of Algiers, the area between Constantine and Philippeville, and the eastern Nemencha Mountains, included attacks on villages and outposts, ambushes of French contingents, sabotage of communications, and assassinations of French settlers and pro-French Moslems.

The peak of violence was reached during the week beginning August 20 (coinciding with the outbreak in French Morocco), in the Department of Constantine. In that uprising a reported 123 French and pro-French Moslems and 1,275 rebels were killed, although Moslem sources charged that French repressive action and French civilian counter-terrorism took a toll of at least twice that number of Moslems. French "mopping-up" operations continued during the remainder of the year, mainly in eastern Algeria and the Department of Constantine. According to a French report, the rebellion took 2,946 French and Moslem lives in the period Nov. 1, 1954—Sept. 30, 1955.

In contrast to the autonomy offered to Morocco and Tunisia in 1955, French policy with regard to Algeria was based on further Algerian integration with France. The French also projected democratic reforms on the local level, increased capital investment to reduce unemployment and land reforms to aid the Moslem tenant farmer, and cultural concessions, including the use of Arabic in the schools.

On Nov. 29, 1955, Governor General Jacques Soustelle addressed a special session of the Algerian Assembly, calling for approval of these reforms. Algerian leaders, however, rejected the policy of integration. Ferhat Abbas, head of the Democratic Union of the Algerian Manifesto, termed the Soustelle program a "false remedy" and demanded the right of self-determination, although the moderate nationalist leader refused to align himself with the rebels in seeking to eject the French by force. The French general elections scheduled for early January 1956 were indefinitely postponed in Algeria by the Paris government on December 12, because of a threatened Moslem boycott and the uncertain security conditions in the territory.

ALIENS. See Index entry.

ALLERGIES. There is an increasing appreciation on the part of physicians that many disease complexes whose causes have heretofore been obscure are definitely due, wholly or in part, to a condition known as allergy or hypersensitivity of the individual to ordinarily harmless substances. These substances, called allergens, may be taken into the body by being inhaled or swallowed, by contact with the skin, or from a bacterial infection in the body.* When one of these allergens is taken into the body, the tiny cells in the tissues produce special substances called antibodies which react upon it and attack it.

Allergic diseases are prevalent and potentially serious, as well as often distressingly painful, disrupting normal family life and often destroying a person's ability to work. Asthma and allergy have a greater incidence in the United States than polio, cerebral palsy, multiple sclerosis, and arthritis combined. Asthma is more crippling, more incapacitating, and produces more real physical suffering than do most of these ailments.

Respiratory Allergies.—The literature in this field during the past year has stressed the respiratory allergies. In the United States there are two million people, or one out of every 75, who suffer from asthma, and millions of Americans also have hay fever. One out of every three with untreated seasonal asthma develops a chronic irreversible, intractable asthma which may lead to permanent structural changes in the pulmonary system, and in turn eventually to heart failure. There is increased evidence that psychic disturbances are important factors in the cause of death from asthma, and there is a continued increase in deaths due to the promiscuous use of aspirin, both in children and adults.

Although the hormones, ACTH, cortisone, and hydrocortisone, are unable to prevent the development of respiratory allergies, they are valuable adjuncts in the treatment of them, if properly used under a physician's direction. Inhalants and occupational environment remain the most frequent causes of respiratory disease, although food, infections, and reactions to drugs play an important part. In treating patients whose asthma is complicated by infection, antibiotics and vaccines continue to be used.

Dermatologic Allergies.—Emphasis in the past year has been on contact agents and experiences with them in the fields of new technology and new industrial processes, and on new and old drugs and allergic reactions to them. New agents, used in creams containing zirconium and an antihistamine, are reported for the inactivation of contact eczema caused by certain metals and poison ivy. A new drug, diphenmethanil methyl-sulfate, has also been used successfully. These preparations block the itching and reduce materially the eczema aggravated by scratching or infection due to scratching. Various silicone protective creams to prevent the infecting agent from contacting the skin have also proved to be successful. The so-called atopic dermatitis, caused by offending agent's reaching the skin through the blood stream or by inhaling or ingesting, is now considered to be a constitutional disorder with allergic, psychosomatic, and dermatologic aspects.

American Foundation for Allergic Diseases.—Early in 1953 two leading groups of allergy spe-

* Some of the common allergens are pollens, molds, house dust, animal danders, feathers, orris root, cornstarch and gums in certain cosmetics, kapok, wool, cottonseed, dyes, perfumes, metals, chemicals; such foods as eggs, milk, nuts, fish, and wheat; drugs and serums; and the stings of wasps and bees.

cialists, the American Academy of Allergy and the American College of Allergists, jointly established the American Foundation for Allergic Diseases to meet the growing needs in the field of allergy. The foundation has four basic objectives: (1) stimulation of basic research in allergic diseases; (2) promotion of professional training in allergy in medical schools and hospitals; (3) extension of hospital and clinic facilities for patients; and (4) development of home care and ambulatory treatment for those unable to finance long-continued illness. The foundation has launched a program of public information on allergic diseases to bring about early recognition and prophylactic treatment. The office of the foundation is located at 274 Madison Avenue, New York 16, New York.

FRED W. WITTICH,
Secretary-Treasurer, American College of Allergists; President, International Association of Allergology.

ALLWARD, Walter Seymour, Canadian sculptor: b. Toronto, Ont., Nov. 18, 1876; d. Toronto, April 24, 1955. Recognized as one of Canada's most distinguished sculptors, he was the creator of the massive Canadian National War Memorial on Vimy Ridge in France.

Leaving school at the age of 14, Walter Allward subsequently became an apprentice to a firm of architects, where he remained for five years. After turning his attention to sculpture in 1895, he won a commission, his first, for the figure of Peace which surmounts the Northwest Rebellion Monument in Queen's Park, Toronto. He was then appointed to execute the busts of a number of famous Canadians for the art gallery of the Royal Ontario Museum in Toronto. Following the completion of these came a series of works designed on a grand scale, including the heroic statue of Sir Oliver Mowat in Queen's Park; the massive National South African Memorial; the allegorical Bell Memorial in Brantford, Ont.; and World War I Memorials in Stratford and Peterboro, Ont., and Montreal, Que.

Going to London in 1922, Allward began work on the Canadian National War Memorial on Vimy Ridge, which, overlooking the scene of the Canadian Corps' great victory in 1917, honors the Canadians killed in World War I. The stone monument, with its massive pylons and the figure of a woman brooding over her two dead sons, took 14 years to complete. Dedicated in 1936 by King Edward VIII, it is considered by many as the grandest World War I memorial in Europe.

ALUMINUM. Production of primary aluminum in 1954 was 1,460,565 tons in the United States and 560,900 tons in Canada. United States output during the first ten months of 1955 totaled 1,291,347 tons, an increase of more than 6% over the same period of 1954. Total 1955 production was expected to exceed 1,550,000 tons, a new record high for the fourth consecutive year.

All North American producers increased output during 1955 by more complete utilization of facilities built after the start of the Korean War, and all have more expansion under way. In August, the Anaconda Aluminum Company poured its first aluminum in a new 60,000-ton capacity smelter at Columbia Falls, Mont. In September, the Harvey Machine Company signed a government supply contract which will enable it to become the fifth United States producer by erecting

a 54,000-ton plant at The Dalles, Oreg. In December, Kaiser Aluminum and Chemical Corporation announced a \$280 million expansion program which will include a new 220,000-ton coal-powered smelting plant at Ravenswood, W. Va., and a 500,000-ton alumina plant near Gramercy, La.

Aluminium Limited announced plans in mid-March 1955 for investing \$190 million in expansion of its Kitimat (B.C.) smelter to a yearly capacity of 331,500 tons; and in October, Aluminium Limited announced that it would undertake immediate expansion of its Isle Maligne, Quebec, smelter to provide an additional 22,000 tons of aluminum per year.

Rising United States manufacturing costs resulted in price increases for basic aluminum in January and August 1955. Pig and ingot aluminum advanced to 22.5 and 24.4 cents per pound, respectively. Demand for aluminum during 1955 reached an all-time high, forcing the government to bolster the available civilian supply by deferring a substantial portion of the metal earmarked for delivery by producers to the national stockpile.

Construction continued to demand more aluminum in 1955, with windows, representing the building product consuming the most aluminum. Colored aluminum finishes for exterior wall panels have aroused great interest among architects. A new office building in Cincinnati, Ohio, has one side blue, the other gold.

Automobiles used a record quantity of aluminum during 1955, averaging 30 pounds per car. Trim applications were growing rapidly, and forged aluminum wheels made their first appearance. Refrigerators, freezers, steam irons, room air-conditioners, and outdoor furniture also represented fast-growing aluminum applications. Rapid progress in the electrical field continued, as the price and scarcity of copper increased, and distribution lines and telephone cable offered a tremendous market potential for aluminum. Use of aluminum foil for packaging continued to grow rapidly. Aluminum tanks for domestic hot water heaters were in full-scale production in 1955, and the popularity of aluminum irrigation pipe continued to grow. Highway engineers were specifying more aluminum for signs and bridge railings, and sportsmen were exhibiting increasing preference for aluminum boats and canoes.

During 1955 the Aluminum Company of America (ALCOA) began producing large forged aircraft parts on mammoth 35,000- and 50,000-ton capacity presses installed at Cleveland, Ohio, to meet U.S. Air Force requirements. Mills capable of producing aluminum foil in widths exceeding 60 inches were also in operation in 1955.

Outstanding among new aluminum alloys introduced in 1955 was the ALCOA alloy X2219. It has exceptionally good mechanical properties at elevated temperatures (500° to 600°F), and shows considerable promise for supersonic aircraft and automotive engine parts.

AMERICAN ACADEMIES AND ASSOCIATIONS.

For organizations whose titles begin with the word American (excepting American Federation of Labor and American Library Association, which are reviewed below) see the article SOCIETIES AND ORGANIZATIONS.

AMERICAN FEDERATION OF LABOR. During the past year the American Federation of Labor continued to grow, and at the close of the fiscal year of the federation on June 30, 1955, the total paid-up membership was 9,615,333. Activity was continued in the legislative and political fields on both national and state levels. The concern of the federation for matters of general concern to all citizens was reflected legislatively in efforts to secure better housing for all; to secure improvements in the social security program; for adequate defense appropriations; federal aid for education, etc. While the federation continued its work in the field of political education, Labor's League for Political Education remained the political instrumentality of the federation to comply with the law.

In line with the conviction of the federation that the economic well-being of the peoples of other lands inevitably affects the economic status of America's workers, constant watch was kept on economic and employment trends throughout the free world.

The activities of the AFL in the general field of adult education was conducted mainly through its Department of Education, which directs projects in its field on both state and local levels. This work was greatly expanded during the past year, and a number of international unions either in-

stituted or increased educational activity. The need for a vocational program was emphasized as necessary to meet the need for skilled craftsmen to develop the fullest possible production strength of the nation.

During the past year the AFL not only continued but increased its efforts to combat Communist influence throughout the free world. Through the International Confederation of Free Trade Unions (ICFTU), the Inter-American Regional Labor Organization (ORIT), International Labor Organization, and active participation wherever afforded in advisory government groups, the federation energetically endeavored to promote the democratic free way of life. Through the Free Trade Union Committee, which was established more than ten years ago, aggressive anti-Communist activity has been conducted through assistance to weak free trade union forces, not only in Europe but also in Asia and Africa, as bulwarks against subversive influences. Full cooperation has also been given to government agencies charged with the development of better understanding between the people of the United States and other countries. The AFL was represented on the Labor Advisory Committee of the Foreign Operations Administration, and the Department of Labor's Trade Union Advisory Committee on International Affairs.

In the introduction to its final report, the Executive Council reaffirmed the purpose of the federation, which was unanimously approved: "Our first responsibility must be to our country. We must so conduct ourselves, both in the formulation and implementation of basic policies, as to promote at all times the peace of the world, the security of the free American way of life and its economic and social progress."

One of the most important developments in the labor movement of the country during 1955 was the merger of the American Federation of Labor and the Congress of Industrial Organizations, which was effected in December. This merger created the largest single labor federation in the free world, with a membership of more than 15 million. (For further details, see CONGRESS OF INDUSTRIAL ORGANIZATIONS AND LABOR.)

GEORGE MEANY,
President.

AMERICAN LIBRARY ASSOCIATION. Founded in Philadelphia in 1876, the ALA is the oldest professional association for librarians in the world. As the chief spokesman for the modern library movement in North America, it has considerable influence in other countries as well. In 1955, its membership was approximately 20,000, with representation from the United States and possessions, Canada, and more than 50 foreign countries.

The year 1955 saw the completion, continuance, and start of many projects. Outstanding among the new projects was the authorization for a management survey of the association, which was conducted by the firm of Cresap, McCormick and Paget. Plans were under way for the implementation of the recommendations of the survey, which was accepted by the ALA Council at its annual meeting in July.

The American Heritage Project, financed by a special grant from the Fund for Adult Education, was continued. During its four years of operation a total of 1,153 discussion leaders were trained, and 16,753 people participated in 1,063 groups all over the country. In the fall of 1955 a

new project was established with a grant from the Fund for Adult Education, to be known as the Library-Community Project. It will be concerned with the establishment of a soundly based and well-integrated program of adult education in four pilot libraries in Kansas, Maryland, Michigan, and Tennessee.

A special grant of \$30,000 from U.S. Steel Corporation has been given to the Association of College and Reference Libraries, a division of ALA, for the support of liberal arts college libraries throughout the country. The association was concerned with revising the standards for public and school libraries, and continued to promote the cause of intellectual freedom, to recruit able men and women to the profession, and to develop worthwhile reading habits for children and adults.

Headquarters of the Association are located at 50 East Huron Street, Chicago 11, Illinois, where a staff of 95, supplemented by over 700 members of volunteer boards and committees, carry on its work. David H. Clift is executive secretary, and Mrs. Grace T. Stevenson, associate executive secretary. A Washington office is located in the Hotel Congressional, where liaison with all federal agencies is maintained and libraries are represented on many projects. In 1955 this office worked particularly for the passage of the Library Services Bill (S. 205 and H.R. 2840) which was reported favorably out of the House Committee on Education and Labor in July and will be presented to the second session of the 83d Congress.

Conferences.—The 74th Annual Conference of the ALA was held in Philadelphia, July 3-9, 1955, with an attendance of 4,500. The conference theme, "Libraries in the Life of the Nation," was developed by many of the speakers.

The most important business taken up by the ALA Council at its annual meeting was the presentation and discussion of the management survey of the association. In addition it endorsed the School Library Bill of Rights and adopted the *Library's Pay Plan: A Statement of Principles*. At the midwinter meeting, held in Chicago, February 1-5, many ALA divisions and committees held business sessions for carrying on the work of the association. Future conference plans call for a midwinter meeting in Chicago, Jan. 31-Feb. 4, 1956; and annual conferences in Miami Beach, Fla., June 17-23, 1956; and in Kansas City, Mo., June 23-29, 1957.

Officers.—At the Philadelphia conference in July 1955, John S. Richards, Seattle Public Library, became president for 1955-56; Ralph R. Shaw, Graduate School of Library Service, Rutgers University, New Brunswick, N.J., became first vice president and president-elect; and Mrs. Frances L. Spain, New York Public Library, became second vice president. Raymond C. Lindquist, Cleveland Public Library, is the treasurer.

Awards and Citations.—The annual ALA citations for distinguished service as library trustees were awarded to Mrs. George R. Wallace, trustee of the Fitchburg (Mass.) Public Library, and to Ralph D. Remley, trustee of the Maryland County Library, Rockville, Md.

Meindert DeJong received the 34th Newbery Medal for *The Wheel on the School*, judged to be the most distinguished children's book published in the United States during the year. The winner of the 18th Caldecott Medal, Marcia Brown, was honored as the illustrator of the most outstanding picture book for children, *Cinderella*. Both medals are provided annually by Fred-

erick G. Melcher, publisher of the *Library Journal and Publishers' Weekly*.

Other important ALA awards and citations in 1955 were as follows:

The 1955 Joseph W. Lippincott Award of \$500 for distinguished service in the profession of librarianship went to Emerson Greenaway, director of the Free Library of Philadelphia.

The Ada McCormick *Letter Magazine* award of \$100 went to the Kentucky Library Extension Division for its contribution in extending the numbers and degree of an informed citizenry in the State of Kentucky through placing nearly 100 bookmobiles in service. The 1955 *Letter Librarian* Award was received by Helen M. Harris, librarian, Lawson-McGhee Library, Knoxville, Tenn., for her exemplification of the best traditions of library service.

Thirteen libraries received the John Cotton Dana Publicity Award, sponsored by the *Wilson Library Bulletin* in cooperation with the ALA Public Relations Committee. Six others received honorable mention, and nine were presented with a special award.

The Margaret Mann Citation was awarded to Seymour Lubetzky, consultant on bibliographic and cataloging policy in the Library of Congress, for his contribution to the field of cataloging and classification.

The Melvil Dewey Medal was given to Maurice F. Tauber, Melvil Dewey professor at the School of Library Service of Columbia University, for creative professional achievement both as a librarian and as a teacher.

The E. P. Dutton-John Macrae Award (\$1,000) for advanced study in the field of work with children and young people, went to Mrs. Barbara Davis Widem, assistant librarian in the Center for Children's Books, University of Chicago.

The Grolier Society Award (\$500) was given to Mrs. Charlemae Rollins, children's librarian at the Hall Branch of the Chicago Public Library, in recognition of her outstanding contribution to the reading of young people.

Arthur and Elizabeth Rose of State College, Pa., received the Oberly Memorial Award presented every other year for the best bibliography in the field of agriculture and related sciences, for their scholarly work, *Distillation Literature, Index and Abstracts 1946-52*. Honorable mention was given to Elizabeth Gould David, Josiah C. Folsom, Angelina Martinez, and C. Noel James for bibliographies in the field.

Income.—The ALA is financed by membership dues, endowment income, and occasional grants for special projects. Its endowment capital is approximately \$2,460,000. The total income in 1954-55 was about \$1,170,600, with approximately \$215,400 coming from membership dues.

Publications.—The ALA conducts a nonprofit cooperative publishing program. Periodicals published include the *A.L.A. Bulletin*, *The Booklist*, and *Subscription Books Bulletin*. ALA's divisions issue: *Public Libraries*, *Top of the News*, *College and Research Libraries*, *Journal of Cataloging and Classification*, *School Libraries*, and *Hospital Book Guide*. Among the books published in 1955 were: *Planning the Library Building*; *Charging Systems* and *Serial Publications*. (See also LIBRARIES.)

HELEN T. GEER,
Librarian, ALA Headquarters Library.

AMERICAN LITERATURE. The year 1955 witnessed neither the emergence of any new writer of great distinction nor the publication of a major work by an established writer of distinction. Robert Penn Warren's widely read *Band of Angels* was the most serious attempt at a novel of stature in 1955. It was a study of a woman, half-white, half-Negro, caught up in the events of the Civil War, searching for a sense of personal identity. Its failure to achieve the literary significance of Warren's earlier *All the King's Men* (1946) lay perhaps in the fact that its heroine's reactions to the crises in her life seemed too carefully maneuvered, too like the gestures of an actress not quite submerged in her role. Measured, however, against MacKinlay Kantor's *Andersonville* (also a best-seller in 1955), a carefully documented, fictionalized history of the infamous Civil War prison at Andersonville, Ga., Warren's *Band of*

Angels was an effective imaginative novel, and a minor work of art.

More characteristic of the widely read novels of 1955 by authors of established reputation were a series of documentary studies of the social attitudes and the morals of men and women from varying strata of contemporary American life. The most professional of these, the one realized with the greatest skill and precision of phrase, was John P. Marquand's *Sincerely*, Willis Wayde, a portrait of a successful American businessman loyal only to his own economic ambitions. Lacking somewhat in the suavity of Marquand's style, but also examples of the novel as document, were Herman Wouk's *Marjorie Morningstar*, the experiences and the moral decisions of a young girl from New York's Jewish community; John O'Hara's *Ten North Frederick*, the private life of a public figure; and Norman Mailer's *The Deer Park*, life among the ignoble savages of Hollywood.

In so innocuous a literary year as 1955, one of the curiosities of criticism was *Time's* eulogy, in its September 5 issue, of Wouk's *Marjorie Morningstar* as "a mutiny against . . . three decades of U.S. fiction dominated by skeptical criticism, sexual emancipation, social protest and psychoanalytic sermonizing." *Life* magazine of September 12, following *Time's* lead, in an editorial, "Wanted: An American Novel," demanded a more moral and spiritual type of fiction than that given American readers by the "overripe school of the Truman Capotes," and by the "obscurity-obsessed school of 'new realism.'"

This *Time-Life* identification of the great American novel with a fictionalized tract on morality and joy, a kind of public square monument to the success of the American businessman and to the personal virtue of American citizens, tempted Harvey Breit to reply (*New York Times Book Review*, October 9): "demand a specific literature and you will get a specific mediocrity." The critic Maxwell Geismar, in an article entitled "The Age of Wouk" (*Nation*, November 5), further described the *Time-Life* plea for a literature of moral conformity as "a program for a new slap-happy optimism" that would avoid "all serious human issues."

More sober appraisals of the contemporary American novel, in 1955, included the novelist William Faulkner's assertion that its greatness should be measured by its attempt "for the impossible," by its effort "to reduce all human experience to literature" ("A Walk with Faulkner," *New York Times Book Review*, January 30). Hiram Haydn's "What's Wrong with the American Novel," a report in *The American Scholar's* autumn issue of a symposium of three editors and three young American novelists, emphasized the alienation of the contemporary writer from his audience. Arthur Mizener's "The Thin, In-

telligent Face of American Fiction," in the autumn issue of *Kenyon Review*, defined the tone of much present-day writing. The young novelist Herbert Gold, in "Truth and Falsity in the Novel" (*Hudson Review*, fall issue), rejected the work of the Truman Capotes and the Paul Bowleses as decisively as had *Time* and *Life*, but not for its failure to celebrate the American dream of life as an endless success story. Rather, Gold argued, the failure of the novel which suggests that humanity is "ugly and obscene . . . unfit for adventure and decision . . . doomed to incoherence and suicide," is a failure of the novelist's sense of truth.

With the death of Bernard De Voto (q.v.) in November 1955, American letters lost the last member of the school of Mencken who practiced literary and cultural criticism as the art of energetic assertion of personal opinion. De Voto was a sturdy advocate of literature as a vehicle for social criticism, and with his death, the post-World War II critics of the literary journals lost a favorite target. He was their most useful enemy in their advocacy of a literature which, in Allen Tate's phrase, "has no useful relation to the ordinary forms of action." Another significant loss was that of the skilled dramatist and historian, Robert E. Sherwood (q.v.), who also died in November.

Despite the apprehensions voiced by *Time* and *Life* magazines, the reading habits of Americans, in 1955, remained stubbornly wholesome. Norman Vincent Peale's *The Power of Positive Thinking* and Mrs. Peter Marshall's *A Man Called Peter*, both easily classifiable as "uplift" books, remained nonfiction best-sellers in 1955, more than three years after publication. They were most seriously challenged by Anne Lindbergh's new work of 1955, *Gift from the Sea*, a quietly speculative study of the American woman's social role and her spiritual needs. *Gift from the Sea* had sold well over a quarter of a million copies by the end of the year. Of the new fiction in 1955, Herman Wouk's *Marjorie Morningstar*, heralded by *Time* for its depiction of normal aspects of contemporary America, had sold 150,000 copies within a few weeks of publication, and seemed destined to be the most widely read novel of the year.

The Novel.—Robert Penn Warren's *Band of Angels* was the most nearly successful example of the novel of formal artistry in 1955. Its story of Amantha Starr, raised as a lady of the ante-bellum South, and after her father's death sold as a slave in Civil War New Orleans upon the discovery of her Negro blood, was in no sense an attempt at fictionalized American history. Rather, Warren involved his heroine with a violent civil crisis of time past in order to give perspective to her sense of being engulfed by history and by the events of her life, without ever being able to

(Left to right) MacKinlay Kantor, Anne Morrow Lindbergh, Sloan Wilson, and Herman Wouk.

PHOTOS BY STEINMETZ; LUCIA NEBEL WHITE; PHILIPPE HALSMAN; RICHARD AVEDON

grasp some fragment of meaning as to the significance of these events. MacKinlay Kantor's *Andersonville*, by contrast, was a wholly successful example of the novel as document. His romantic, highly episodic prose pageant of Andersonville Prison, the Dachau of the American Civil War, was a novel in which hundreds of characters were carefully and accurately dressed in the ideas, the language, and the gestures of Americans of the mid-19th century. One got a sense of all the external details of living during the violence of 1861-65, but little sense of the "truth" of his characters, of their essential nature as thinking, feeling human beings.

Two of the most widely read and most widely commented upon documentary novels of 1955, depicting contemporary Americans in their endless quest for success, were John P. Marquand's *Sincerely*, Willis Wayde, and Herman Wouk's *Marjorie Morningstar*. Marquand's novel was by far the more brilliant of the two because of the cumulative effect of its mild, but sustained, satire of the titular hero, a young man who moves swiftly and capably from New England factory town to Harvard Business School to corporation executive. He is completely satisfied of his own integrity, and wholly incapable of a selfless deed. Wouk's novel of his titular heroine's attempt to become an actress, and the clash between her desire for moral respectability and her fascination by amorous adventure, lacked the intellectual vigor of Marquand. Wouk, like the 18th century Richardson with his famous *Pamela*, seemed unwilling to risk a novel sustained by an adult awareness of the vast difference between the merely prurient and the honestly innocent.

Norman Mailer's *The Deer Park*, and John O'Hara's *Ten North Frederick* were further examples of the novel as social document, and both perhaps verged on what *Life* called the "obscurity-obsessed school of 'new realism.'" Mailer's study of the love games played in Hollywood's desert colony, lacking any focus in concept or event, was a mere parade of a series of mindlessly dull, besotted self-seekers, and was a failure (in terms of Herbert Gold's essay) of Mailer's, or a reader's, sense of truth and reality. O'Hara's *Ten North Frederick*, the detailed examination of the sexual affairs and the political scandal lying behind the façade of the leading citizen of his fictional Gibbville, had the virtue and strength of its author's sense of value, and did not drift into meaninglessness, as did *The Deer Park*.

Novels by intellectuals included Mary McCarthy's *A Charmed Life*, less vitriolic than usual for her in its sketching of egotistical artists and their passions and intellectualizings; Paul Bowles' *The Spider's House*, the political difficulties between the French and the Arabs in Morocco; Elizabeth Hardwick's *The Simple Truth*, the ironic defeat of two people, committed to the life

of the mind, who try to fathom the character of a man on trial for murder.

Highly competent novels, not especially startling as to theme, by writers of established reputation, included *The Persistent Image*, written with sharp insight by Gladys Schmitt concerning a woman who returns to her first love; *The Farther Shore*, by Robert M. Coates, another of his novels of the pathology lurking in the minds of men; *Faithful Are the Wounds*, by May Sarton, the roles of the friends of a Harvard professor in his suicide; *Bell's Landing*, by Gerald Warner, the influence of two Victorian aunts on two nephews; *Blizzard*, by Phil Stong, reactions of an Iowa community caught by a storm; *The Sun at Noon*, by Charles Angoff, the lives of a Jewish-American family in Boston; and *The Years of the City*, by George Stewart, a chronicle of an imaginary Greek city, a kind of parable of mutability.

Popular studies in contemporary violence included such novels as Robert Ruark's best-selling *Something of Value*, about the Mau Mau uprising in Kenya; Budd Schulberg's *Waterfront*, a novelized version of his well-known motion picture of New York waterfront gangsters; and Don M. Mankiewicz' *Trial*, Harper's prize novel of 1954, about a Mexican boy on trial for murder, and the Communist Party's attempt to claim him their martyr.

Novels by newcomers receiving critical mention included Mario Puzo's *The Dark Arena*, an ex-GI in postwar Germany; Thomas Hal Phillip's *The Loved and the Unloved*, tensions leading to murder in the poor-white South; William Krasser's *North of Welfare*, life in Harlem; Davis Grubb's *A Dream of Kings*, Civil War America; and Anton Fereva's *The Year of August*, tragic involvements in a California valley town.

Adult entertainment, touched with overtones of serious ideas, made the following novels popular reading in 1955: C. S. Forester's *The Good Shepherd*, a North Atlantic convoy and its most exciting 48 hours; Sloan Wilson's *The Man in the Gray Flannel Suit*, New York suburban life with its tensions of job versus conscience, a thinned-out Marquand; and Thomas B. Costain's *The Tontine*, a historical romance by an expert who deals with the lives of a series of shareholders (and their descendants) of a Victorian insurance trust.

The Short Story.—If the novel as social document dominated the literary scene in 1955, it was the short story as autonomous art object which was most collected and most published. At its best, much as a poem does, such a short story of the dramatic or emotional moment gains its perceptive insight into the private, isolated world it evokes. At its worst, the merely artful short story—the literary thing-in-itself—is a beautiful, shining machine in a museum case, forever turn-

(Left to right) Robert Penn Warren, Norman Mailer, John P. Marquand, and Lionel Trilling.

PHOTOS BY PHYLLIS CERF; TALBOT; MARIE S. NEWBERRY; F. ROY KEMP

ing its wheels, but doing no work. The year 1955 witnessed a series of collections of short stories as autonomous art object, with examples of both sorts in each collection. The list included Eudora Welty's *The Bride of Innisfallen and Other Stories*; Shirley Ann Grau's *The Black Prince and Other Stories*; Flannery O'Connor's *A Good Man Is Hard to Find*; Elizabeth Enright's *The Moment Before the Rain*; Frances Gray Patton's *A Piece of Luck*; Jessamyn West's *Love, Death and the Ladies' Drill Team*; Nancy Hale's *The Empress's Ring*; Tennessee Williams' *One Arm and Other Stories*; *Prize Stories 1955: The O. Henry Awards* (ed. by Paul Engle and Hansford Martin); and *The Best American Short Stories 1955 and the Yearbook of the American Short Story* (ed. by Martha Foley).

Different in tone were William Faulkner's *Big Woods*, with drawings by Edward Shenton, a collection of stories revised to make a unified book of fiction dealing with hunting in Mississippi, and including the famous *The Bear* and *Delta Autumn* in altered form. Samuel Hopkins Adams' widely read *Grandfather Stories* were of early American life shortly after the Revolutionary War through reminiscences of Adams' grandfather.

Poetry.—As an innovation in publishing technique, to make the publication of new poets economically possible, Scribner's ventured a second anthology, or collection, *Poets of Today II*, containing the work of Norma Farber (*The Hatch*), Robert Pack (*The Irony of Joy*), and Louis Simpson (*Good News of Death and Other Poems*), the whole work edited by the well-known poet, John Hall Wheelock. Recent work by the most precise and most intellectual of American poets was W. H. Auden's *The Shield of Achilles*. The work of other established poets of Auden's generation, or a bit younger, included *Selected Poems*, by Randall Jarrell, the first major poet to emerge from World War II; *As If. Poems New and Selected*, by John Ciardi; *Poems*, by Elizabeth Bishop; and *The Salt Garden*, by Howard Nemerov. *Selected Poems*, by Robert P. Tristram Coffin (q.v.), the New England poet of the homespun and the seacoast, was a posthumous publication. *Gentlemen's Relish*, by Christopher Morley, was a small, 100-page collection of his work since 1951, and largely personal.

The Complete Poetical Works of Amy Lowell, a 670-page volume with an introduction by Louis Untermeyer, was a tribute to the imagist movement of the 1920's. *The Poems of Emily Dickinson. Including variant readings critically compared with all known manuscripts*, edited in three volumes by Thomas H. Johnson, was a definitive scholar's edition.

Literary History and Biography.—Two collections of critical essays, Lionel Trilling's *The Opposing Self: Nine Essays in Criticism*, and R. P. Blackmur's *The Lion and the Honeycomb; Essays in Solicitude and Critique*, helped summarize the points of view of two of the most highly valued contemporary American critics. Trilling's work emphasized the friction between the autonomous, creative "self" and the culture in which it worked. Blackmur emphasized, especially in the titular essay, the complementary relationship between scholarship and criticism. Other examples of literary criticism of a high order in 1955 were found in Alfred Kazin's *The Inmost Leaf, A Selection of Essays*; Leslie A. Fiedler's *An End to Innocence*; and Marianne Moore's *Predilections*, her comments on her contemporaries. *Party of One: The Selected Writings of Clifton Fadiman*

contained the literary and other comment of a highly literate journalist, including his famous attacks on Faulkner and Gertrude Stein. Robert E. Spiller's *The Cycle of American Literature* was scholarly criticism of a high order; Stanley T. Williams' two-volume, 1,009-page *The Spanish Background of American Literature* was a massive contribution of factual scholarship.

The following important critical biographies of American writers were published in 1955: *Thomas Wolfe, The Weather of His Youth*, by Louis D. Rubin, Jr.; *The Stature of Theodore Dreiser: A Critical Survey of the Man and His Work*, an anthology of criticism edited by Alfred Kazin and Charles Shapiro; *Young Henry James, 1843-1870*, by Robert C. Le Clair; *Longfellow: A Full-Length Portrait*, by Edward Wagenknecht; *The Solitary Singer: A Critical Biography of Walt Whitman*, by Gay Wilson Allen; *The Rungless Ladder, Harriet Beecher Stowe and New England Puritanism*, by Charles H. Foster; and *Henry Adams*, by Elizabeth Stevenson.

History and Biography.—*Memoirs by Harry S. Truman, Vol. I: Year of Decisions (1945-1946)* was a widely-read best-seller in 1955, at once a self-portrait of President Truman and an analysis of his first year in office. Richard Hofstadter's *The Age of Reform: From Bryan to F. D. R.* served as a scholar's study of the background of political and social ideas which Truman inherited.

New studies in the Civil War period included: Earl Schenck Miers' *The Web of Victory: Grant at Vicksburg*; J. Cutler Andrews' *The North Reports the Civil War*, an evaluation of the war correspondents; *Three Years With Grant, As Recalled by War Correspondent Sylvanus Cadwallader*, edited by Benjamin P. Thomas; and *Three Lincoln Masterpieces: Cooper Institute Speech, Gettysburg Address and Second Inaugural*, by Benjamin Baroness, a study of the historical background of the speeches.

Earlier America and its culture was analyzed in *Rebels and Democrats: The Struggle for Equal Rights and Majority Rule During the American Revolution*, by Elisha P. Douglas; *Cities in Revolt: Urban Life in America, 1743-1776*, by Carl Bridenbaugh, a study of the 18th century sophistication of five American cities; and *Culture on the Moving Frontier*, essays in evaluation by Louis B. Wright.

Biographies of key figures in 19th century America included Charles Albro Barker's 696-page study of the advocate of the single tax, *Henry George*; Stewart J. Holbrook's *James J. Hill, A Great Life in Brief*, an account of the builder of the Great Northern Railway; Harry Barnard's *Rutherford B. Hayes and His America*; J. G. Randall and Richard N. Current's *Lincoln the President: Last Full Measure*; Hudson Strode's *Jefferson Davis: American Patriot*, stressing the man in his early years, and based on private papers and letters; Llerena Friend's *Sam Houston: The Great Designer*; and John William Ward's *Andrew Jackson: Symbol for An Age*, a cultural history by a literary scholar. David P. Edgell's *William Ellery Channing: An Intellectual Portrait* and Arthur S. Bolster, Jr.'s *James Freeman Clarke: Disciple of Advancing Truth* were studies in key figures in beginnings of the Unitarian Church of New England.

Biographies and self-portraits of contemporary Americans of note included Edward Weeks' *The Open Heart*, by the editor of *Atlantic Monthly*; Van Wyck Brooks' *John Sloan, A Painter's Life*; *It's Me O Lord, The Autobiography of Rockwell Kent*, the American artist; Helen

Keller's *Teacher: Anne Sullivan Macy, A Tribute by the Foster Child of Her Mind*; Ludwig Bemelmans' *To the One I Love Best*, a sketch of Elsie de Wolfe, Lady Mendl, of café society; and Nathaniel Benchley's *Robert Benchley: A Biography*, the life of the humorist, critic, and actor by his son.

Lives of stage personalities in 1955 included Ethel Barrymore's *Memories: An Autobiography*; John Bainbridge's *Garbo*; Guthrie McClintic's *Me and Kit* (Katharine Cornell); and Richard Stoddard Aldrich's *Gertrude Lawrence as Mrs. A.*, the English actress as American wife.

Miscellaneous Nonfiction.—American humor in 1955 was represented by *Thurber's Dogs: A Collection of the Master's Dogs, Written and Drawn, Real and Imaginary, Living and Long Ago*; Betty MacDonald's *Onions in the Stew*; Emily Kimbrough's *So Near and Yet So Far*; and S. J. Perelman's *Perelman's Home Companion*.

The art of the essay flourished in *The Vintage Mencken*, gathered by Alistair Cooke for the 75th birthday of H. L. Mencken; *The Easy Chair*, 31 essays by De Voto, containing pugnacious criticism of America's cultural ways; *Notes of a Native Son*, by James Baldwin, studies in Negro-white relations by the young negro novelist; and *The Voice of the Desert: A Naturalist's Interpretation*, by Joseph Wood Krutch, dramatic critic and former Columbia University professor, attempting to capture the feel and sense of the Arizona desert.

Philosophical and political speculation in 1955 was represented by *John Dewey: His Contribution to the American Tradition*, edited by Irwin Edman; *The Letters of George Santayana*, edited with commentary by Daniel Cory, covering the period 1886-1952; *Reflections on the Failure of Socialism*, by Max Eastman, a long personal essay; *Grand Inquest: The Story of Congressional Investigation*, by Telford Taylor, a history of congressional practice since 1792; *Academic Freedom: An Essay in Definition*, by Russell Kirk, a challenge to the liberals; and *Essays in the Public Philosophy*, by Walter Lippmann, a trenchant discussion of American foreign policy by the most intellectual of American political commentators.

AMERICAN SAMOA. See SAMOA.

ANDORRA. An autonomous state on the south slope of the eastern Pyrenees, under the joint sovereignty of the president of France and the Spanish bishop of Urgel. Area, 175 square miles; pop. (1954 census), 5,664. Andorra la Vieja (1,100) is the capital. Andorrans speak Catalan and are of the Roman Catholic faith. There is a 24-member General Council of the Valleys elected for a 4-year term by heads of families. The council chooses a syndic as its executive. France represents Andorra in foreign affairs. French and Spanish currency are in use. Chief occupations are agriculture and sheep raising. There is a cigarette factory. Tourism and smuggling are major sources of income. A highway crosses the state from southwest to northeast. Radio Andorra is one of the most powerful stations in Europe.

ANGLING. See SPORTS, GAMES, AND SHOWS—*Fly and Bait Casting*.

ANGLO-EGYPTIAN SUDAN. A former African condominium (agreement abrogated in October 1951) ruled jointly by Great Britain and Egypt, the Sudan, with six northern and three southern provinces, each having a governor, was given self-government and a self-determination statute in 1953, and became an independent republic Jan. 1, 1956. With an area of 967,500 square miles, the Sudan extends southward from Egypt to Kenya, Uganda, and the Belgian Congo. It is bounded on the west by French Equatorial Africa and Libya, and on the east by the Red Sea and Ethiopia (with Eritrea). The Nile traverses its entire length.

Population.—The diverse population of 8,900,000 (unofficial midyear 1954 estimate) comprises predominantly Moslem Arabs (66% to 75% of the entire population) and Nubians in the north; and Nilotic, Hamitic, and Negro tribes in the south. The population is increasing rapidly, and about 2,327,000 inhabit the 60,475 square miles of the Blue Nile and Khartoum provinces. The city of Khartoum is the capital and, with the adjoining cities of Khartoum North and Omdurman, had an estimated 1954 population of about 257,300. Other important cities are: El Obeid (70,100), Port Sudan (60,600), and Wad Medani (57,300).

Government and Political Events, 1955.—On Feb. 12, 1953, Great Britain and Egypt signed an agreement to end the condominium and recognize the self-government statute of the Sudan. The statute provided for a governor general (Sir Alexander Knox Helm, whose appointment was announced on Dec. 30, 1954), who was in charge of foreign affairs and responsible to the contracting governments. He was assisted by an international commission, consisting of a Pakistani chairman and 1 British, 1 Egyptian, and 2 Sudanese members.

The statute also provided for a Sudanese cabinet to govern, under the governor general, during a 3-year transitional period to end not later than January 1957. The cabinet assumed office on Jan. 9, 1954, with Ismail el-Azhari as prime minister and minister of interior, and later (Dec. 25, 1954) as minister of defense. El-Azhari was forced to resign on Nov. 10, 1955, following a vote of no confidence, but was reappointed prime minister and accepted by Parliament on November 15.

Parliament, by another statutory provision, convened on Jan. 1, 1954, and has a Senate of 50 members, of which 30 are elected and 20 are appointed by the governor general, and a House of Representatives of 97 elected members. The National Unionist Party, which has been friendly with Egypt, holds the majority, with 21 seats in the Senate and 47 seats in the House of Representatives. Other parties are: the Umma (People's) Party, which was pledged to seek full independence; the Southern Freedom Party, which desired autonomy of the three southern provinces; the Republican Independence Party, which wished full independence, but pledged co-operation with Egypt primarily on economic and cultural questions; the Southern Unionist Party; and the Socialist Republican Party.

The convening of Parliament on Jan. 1, 1954, began the 3-year transitional period, which was to be followed by the election of a Constituent Assembly to determine whether the Sudan should become independent or retain some tie with Egypt. During the transitional period the Sudanization of the administration was to be effected under the supervision of a committee of 1 British, 1 Egyptian, and 3 Sudanese members. The committee held its last meeting on Aug. 7, 1955, and on August 16, Parliament voted for the final process of self-determination to begin. As agreed, British and Egyptian troops began immediate evacuation; and on August 22, Parliament voted for a commission of nationals from Sweden, Norway, Switzerland, India, Pakistan, Yugoslavia, and Czechoslovakia to supervise the election of the assembly, despite British objections to the inclusion of the latter two. Sudanese government opposition leaders have made various charges concerning Egyptian political activities in the Sudan with regard to the elections. (See also EGYPT.)

An agreement signed in Cairo by Great Britain and Egypt on December 3 cleared the way for the election, and on December 19 the House of Representatives adopted a resolution declaring the country's independence.

On Jan. 1, 1956, the Sudan became an independent republic, recognized by Britain and Egypt; and Premier El-Azhari, at ceremonies in Khartoum, raised the country's blue, green, and yellow flag. At the same time, a 5-man Supreme Commission was sworn in to govern until a constitution should provide otherwise.

Religion and Education.—About 5 million Sudanese are Moslems. In the southern provinces the citizens are for the most part, pagan. In addition, there are small numbers of adherents to Coptic, Greek Orthodox, Roman

U.S. NAVY

Scientists with U.S. Navy Antarctic Expedition (1954-55) study snow density atop a 15-foot hut, built at Little America III in 1939 and buried by ice and snow.

Catholic, Maronite, Greek Evangelical, and several Protestant groups, including Anglican.

Government schools, providing education from the elementary to university-entrance levels, are supplemented by various private schools (especially mission schools in the southern provinces), which the government furnishes with many supplies. In addition to 548 elementary schools, which became free in 1955, there were in 1953-54, 509 subgrade village schools, 119 *khalwas* (Koranic schools), and 5 secondary, 1 junior, and 33 intermediate schools. There are trade and technical schools, and a technical institute at Khartoum, 9 teacher-training colleges, and a military college. Women are educated separately, except at the University College of Khartoum, which is constitutionally independent of the government.

Finance.—The present currency of the Sudan is the Egyptian pound (£E1 = U.S.\$2.872), but in June 1955 new Sudanese currency was on hand for use when self-determination is a reality. The budget for the fiscal year 1954-55 showed estimated revenues of £E36 million and expenditures of £E31.9 million. The surplus revenues (£E4,194,222 in 1954-55) are being set aside for a 5-year development program, ending in 1958, which calls for expenditures of £E34 million for public utilities, health, communications, irrigation, and agricultural research.

Production.—The Sudan Gezira Board, which includes 5 Sudanese directors, is responsible to the government for the management of the cotton-growing enterprise in the Gezira, a 5-million-acre triangle between the Blue and White Nile rivers south of Khartoum. The Sennar Dam irrigates 1 million acres of the area, of which 250,000 acres are planted annually in cotton. The land is tenanted, and each tenant has about 40 feddans (1 feddan = 1.038 acres), of which 10 are planted in cotton and 7.5 are used for growing food and fodder crops. The tenant pays no rent or water rate, receives 40% of the cotton profits, and keeps the grain and fodder.

Plans for the extension of the area are being drawn in connection with the proposed Roseires Dam on the Blue Nile, to cost £E25 million over a ten-year period. The new dam would have a capacity of 3 billion cubic meters and irrigate an additional 800,000 acres in the Gezira. Unsuccessful negotiations with Egypt were held in 1955 in connection with water rights for this project.

In 1953-54 the total Sudanese area in cotton cultivation was estimated at 628,314 feddans, and the estimated 1953 crop was 170,000 metric tons of cottonseed and 89,000 metric tons of cotton.

Most of the Sudan's gum arabic, which supplies between 80% and 90% of the world's needs, comes from Kordofan Province. In 1953, 50,000 tons, valued at nearly £E3 million, were exported. Citrus fruits, dates, and mangoes—all cash crops—are grown in the north, in addition to millet (the people's principal food), corn, beans, peanuts, castor beans, and sesame seed (exports of the latter in 1953 were valued at £E1.3 million). In the southern provinces, to-

bacco, coffee, sugarcane, rice, and palm oil are produced. Sudanese livestock includes 2 million camels for transport and meat, 5.5 million cattle, 6 million sheep, 5 million goats, 700,000 donkeys, and 40,000 horses. Much meat is exported to Egypt and Saudi Arabia, and in 1953, hides, skins, and leather, valued at £E900,000, were exported. The principal minerals are gold and gypsum, and mahogany and other valuable woods and forest products are obtained from the forested slopes in the south.

Foreign Trade.—In 1953 the principal exports, with values in Egyptian pounds, were: cotton (26,764,000), cottonseed (3,138,000), gum arabic (3,000,000), and peanuts (1,956,000); principal imports were: textile piece goods (7,539,000), refined sugar (3,833,000), petroleum products (3,123,000), and metals and metalware (3,124,000). Other notable imports included motor vehicles, coffee, footwear, machinery, and wheat flour. The principal countries of export in 1953 were: the United Kingdom (41%), India (13%), and West Germany (11%); and, of import: the United Kingdom (42.6%) and Egypt (8.3%). In 1953 exports totaled £E44,410,000 and imports £E50,668,000, resulting in an unfavorable balance of trade of £E6,258,000.

Transportation and Communications.—The government-owned railway system (2,154 miles were open to traffic as of Sept. 30, 1954) extends from Wadi Halfa in the north (where it connects with the Egyptian State Railways by river steamer service to El Shallal) to Roseires in the south near the Ethiopian border. A branch extends westward to Kareima from near Abu Hamed, and another line runs eastward from the railway center of Atbara to Port Sudan, the country's principal port. From the Port Sudan line at Haiya, another line goes southward by way of Kassala and Gedaref to Sennar, from where it extends westward to El Obeid. The line south of Sennar to Roseires has been built since 1952. In 1955 work commenced on an extension from the El Obeid line at Er Rahad toward Abu Zabad in the southwestern part of Kordofan Province. A 2,618-mile river service operates steamers on the Nile and its tributaries. The Khartoum-Juba steamer service connects in the south by motor transport with the Kenya-Uganda transportation system at Lake Albert.

The Sudan has 26 airfields, and scheduled international service is available to Khartoum and other principal cities. The government-owned Sudan Airways operates intercity service within the country and weekly service to French Equatorial Africa.

Postal, telegraph, radio, and telephone services are government monopolies. In 1954 there were 85 post and telegraph offices and 11,648 telephones (Jan. 1, 1954) in operation. In 1955 telephone service was extended to Juba, El Fasher, Malakal, and Kassala at a cost of £E-850,000.

SYDNEY N. FISHER,
Professor of History, Ohio State University.

ANGOLA. See PORTUGUESE TERRITORIES.

ANIMALS. See references under the Index entry.

ANTARCTICA. This continent, covering 5,100,000 square miles, or about one tenth of the land surface of the earth, is located almost entirely within the Antarctic Circle. Since the continent was first circumsailed by James Cook in 1775, and later sighted by sealers in the 1820's, 180 expeditions from many nations have attempted to

solve some of its geographic and scientific problems.

Official claims to the territory have been made by Great Britain, Norway, Chile, Argentina, France, Australia, and New Zealand, but none of these claims is recognized by the United States, which, like the USSR, reserves all rights for future claims. American expeditions have discovered, surveyed, mapped, and photographed more land on the continent than have the expeditions of all other claimant nations combined.

The Antarctic is separated from the rest of the world by the Atlantic, Pacific, and Indian oceans. Swept by winds which attain velocities of more than 120 miles per hour, and with winter temperatures registering more than 80 degrees below zero Fahrenheit, more than nine tenths of the continent is covered with snow and ice to a depth of several thousand feet. Such climatic conditions support only those animals which derive their food from crustacea flourishing in cold water, such as whales, seals, penguins, and marine birds. Four fifths of the interior remains unexplored even by air.

In January 1955 the U.S. Navy icebreaker, *Atka*, reconnoitered the Ross Sea area to determine the suitability of the Bay of Whales as a location for United States activities during the forthcoming International Geophysical Year, 1957-58. For the second time on record (the first was in 1923) it was found that a huge segment of the 120-foot-high Ross Ice Shelf had sloughed off. Five airplanes, some buildings, food, and much equipment left there by the navy in 1947 had floated out to sea. Because of heavy ice, the *Atka* was unable to reach the coastal shores of the Pacific quadrant to obtain ground control points for previously recorded aerial photographs; and later, the vessel was forced to abandon its attempt to penetrate the Weddell Sea pack ice because of the lateness of the season and damage to one of the propellers. The *Atka* returned to Boston on April 12, 1955, after its 28,000-mile survey cruise.

In the Danish chartered vessel, *Kista Dan*, a party of Australians went through heavy ice floes off MacRobertson Coast of Enderby Land in February 1955, and relieved the 15 men who had wintered at Mawson Base for one year. Food and equipment were replenished, and a new detachment of scientists was landed to prepare for their part in the International Geophysical Year.

Secretly, in January 1955, the Argentine icebreaker, *General San Martin*, penetrated the Weddell Sea pack ice and reached the Gould Bay area on Lassiter Ice Shelf (discovered by the Ronne expedition in 1947). There the Argentines erected their fifth and southernmost station (called Base General Belgrano) in their claimed sector of the Palmer Peninsula. The new station, situated less than 800 miles from the South Pole and manned by 32 men, represented an attempt to get ahead of scheduled British activities in the same area in December 1955.

Helicopters from naval transports relieved a 19-man Argentine garrison marooned by impenetrable pack ice for two years at their Marguerite Bay base. A new group of men was flown in from the transports anchored 140 miles from the base. The Argentines also set up a new base, Camp Esperanza, on the extreme northern end of Palmer Peninsula in the vicinity of the British Hope Bay station, which has been in operation since 1951. In 1955 Argentina set up a civil administration and a branch of the National Bank of Argentina in the sector which she claims.

The 1955 season saw the British occupy two new Antarctic bases off Palmer Peninsula, with four or five men stationed at each. One is located at Anvers Island, and the other at Horseshoe Island in Marguerite Bay.

In addition to making regular weather observations and performing local survey work, the

AUSTRALIAN NEWS AND INFORMATION BUREAU

Antarctic relief ship *Kista Dan* moves through ice floe in Sandefjord Bay on way to Mawson Base, Australian post.

Argentines at five bases, the Chileans at four, and the British at eight, are all maintaining continuous occupation and administration, with magistrates, post offices, etc., in order to strengthen their overlapping claims to the disputed Palmer Peninsula sector. In May 1955, Great Britain proposed that her dispute with Argentina and Chile over the Falkland Islands (q.v.) and the Antarctic territories be submitted to the International Court of Justice. This proposal was rejected by the other two countries.

During 1955, plans were made for 40 nations to participate in the Third International Geophysical Year, 1957-58. The first such year was observed in 1882, and the second, in 1932. Eleven nations, including the USSR, are scheduled to set up bases on the Antarctic continent and offshore islands. United States participation is being sponsored by the National Science Foundation and the National Research Council. The U.S.S. *Arneb*, the last of 7 vessels of Task Force 43, headed by Rear Admiral George Dufek, USN (Ret.), left Wellington, New Zealand, on December 16 for the McMurdo Sound area in the Ross Sea to provide logistic support for United States participation in the International Geophysical Year program. Two bases will be established during the Antarctic summer, and five other bases will be set up in the field during the 1956-57 season. By direction of President Eisenhower, Rear Admiral Richard E. Byrd USN (Ret.) was designated on October 21 as "officer-in-charge" and the senior representative charged with maintaining effective monitorship over those political, scientific, legislative, and operational activities which comprise the United States Antarctic program.

The Soviet Antarctic expedition sailed from the USSR on Nov. 30, 1955. The French expedition, aboard the Norwegian sealing ship *Norsel*, departed from Hobart, Tasmania for Adelie Land on December 26; and the Australians left Melbourne for Mawson Base in the Danish vessel *Kista Dan* on December 27.

FINN RONNE,

Captain, USNR; Leader, Ronne Antarctic Research Expedition, 1946-48; Author of "Antarctic Conquest."

ANTHROPOLOGY. The past year was a normal one in cultural anthropology. Research showed a trend toward ecological and demographic problems; a few new serials were added, one of major significance; and a number of interesting meetings were held.

Group Research.—The West African Institute of Social and Economic Research (Ibadan) sponsored a number of plantation and labor studies in the Cameroons. The East African Institute of Social Research (Makerere) sponsored a study of the African and Asian populations of Kampala. A broad research program emphasizing physical anthropology and medicine and involving extensive field work in central New Guinea has begun at the University of Sydney. Cultural anthropologists will assist by determining, for example, the effects of social organization on the determination of breeding units. The Nuffield Foundation is sponsoring the project. In May 1955 the inter-institutional project for anthropological study in the Philippines, directed by Dr. Fred Eggan, conducted meetings reviewing past research, and laid plans for future work.

The Southwest Project in Comparative Psycholinguistics, which took shape under the Linguistics and Psychology Committee of the Social Science Research Council (SSRC), is financed by the Carnegie Corporation. The early phases of the program have involved research training and seminars at the University of New Mexico, and field studies are beginning. A new research program, "Man in the Tropics," has been initiated with funds from the Rubin Foundation. Involving staff and students from Brandeis, Columbia, Vassar, and Yale Universities, the initial research, directed by Drs. Wagley (chairman), Manners, Mintz, and Murra, will be in the Caribbean.

Individual Research.—Aided by numerous foundations, the number of research projects involving one or two field workers continues to be large. A sampling, showing the diversity of interests, includes: SSRC sponsorship of R. Cohen and W. L. D'Azevedo, both of Northwestern University, doing individual projects in West Africa; F. L. K. Lehman of Columbia University and Human Relations Area Files (HRAF), to do a study on caste and community in India; R. Millon of Columbia University and HRAF, to do ethno-archaeological research in Mexico; H. B. Nicholson of Harvard University, to do research in Mexico; and M. J. Swartz also of Harvard, to do research in Truk.

Anthropologists continue to work among American Indians, as three SSRC grants testify. David McAllester of Wesleyan University is continuing his study of Navajo and Apache music; Helen Codere of Vassar continues to investigate the Kwakiutl; and D. M. Schneider is working on the kinship system of the Mescalero Apache. John P. Harrington, ethnologist of the Bureau of American Ethnology, retired in 1954 but continues his studies of American Indian languages. J. J. Honigsmann continued personality and cul-

ture studies among the Cree in Ontario with a Wenner-Gren grant.

Allen Spitzer of St. Louis University is making a study of the work of Dr. Robert Redfield, and will test his conclusions in the field in Mexico. The National Science Foundation is sponsoring an ethnological and demographic study in Sierra Leone by Dr. and Mrs. V. Dorjohn of Northwestern University. Ford Foundation grants have gone to Miss Paula Hirsch of Northwestern, to study the status of women in Acholi (Uganda); and to Peter Hammond, who will work among the Mossi, as will Dr. Elliott Skinner of Columbia. Prof. Marvin Harris will make an ethnological study in Mozambique.

Among the recently completed researches are: the completion of a grammar and dictionary of Yoruba by Dr. R. C. Abraham, who is now beginning a treatment of Ibo. Prof. J. H. Greenberg has returned to Columbia after a year of linguistic field work in West Africa. Arnold Pilling, University of California, completed 16 months of research in Bathurst and Melville Islands. A. P. Vayda, Columbia University, returned from New Zealand where he made an extensive study of Maori warfare as a Fulbright grantee.

Archives and Publications.—One of the outstanding events of the year was the appearance of the first *Yearbook of Anthropology*, edited by W. L. Thomas, Jr. and others, and sponsored by the Wenner-Gren Foundation. Rather than simply chronicling the anthropological events of the last few years, the *Yearbook* is mainly composed of original articles on major topics.

The Middle East Institute is initiating an annual *Survey of Current Research in the Middle East*, with emphasis on the social sciences. The Sierra Leone Society, founded in 1954, now publishes a journal, *Sierra Leone Studies*, including articles of anthropological interest. Two new items in the Ethnographic Survey of Africa are *The Galla of Ethiopia* and *The Peoples of the Horn of Africa*.

Anthropologists will be interested in the new *Malayan Journal of Tropical Geography*, published by the University of Malaya. Contributions are not limited to Malaya, and frequently treat general tropical problems of agriculture, population, and even culture history.

Education and Anthropology, embodying the results of a conference sponsored by Stanford University and the American Anthropological Association (AAA) in June 1954, was published in 1955.

The International African Institute has received a Ford Foundation grant so that it may reproduce and distribute its bibliographical card index of about 40,000 entries on African studies. The historical documents of Nigeria, including Arabic writings from the 10th century and the British administrative records of the last century, will receive special care and preservation. Steps are being taken in Nigeria to prepare suitable permanent archives.

In Salisbury, Southern Rhodesia, the Central African Archives announced plans to publish some 20 volumes reproducing original manuscripts of importance in the history of eastern and central Africa. The period covered by the documents is 1487 to the early 19th century. Several colonial governments, including Mozambique and the Federation of Rhodesia and Nyasaland, will participate.

Anthropology in Government.—While general employment of anthropologists by the government

seems to remain relatively constant, some specific reductions of interest may be noted. The Foreign Service Institute has reduced its staff and, consequently, the amount of anthropological orientation required of Foreign Service officers and other personnel. In the Trust Territory of the Pacific, where five anthropologists had been employed as advisers to administrators, the promotion of one to island affairs officer, and the return of Saipan to U.S. Navy jurisdiction reduced the number of advisers to three. Gordon MacGregor reports that a summary of the research carried out in the trust territory up to July 1, 1953, is available in the *Clearing House Bulletin of Research in Human Organization*.

The Indian Claims cases, based on a 1946 act of Congress which permits American Indians with tribal affiliations to sue as groups for indemnities claimed as the result of broken treaties or other injustice, continues to employ the services of a large number of professional anthropologists and graduate students, mostly on a part-time basis. These anthropologists work either for the Department of Justice, preparing the government's case, or for the plaintiffs. Theoretical anthropology will ultimately gain from the research in this litigation. Extensive discussions of implications of the new data recovered in this work have already been given considerable space on the program of the annual meeting of the AAA. Prof. Ralph Beals also has prepared one of the most intensive cultural-ecological studies yet undertaken, and is expected to present his findings to the profession when his materials are released from judicial restriction. The study relates to the distribution of Indians in California in the middle of the 19th century.

Meetings.—In addition to the regular meetings which are held annually by professional societies, a number of special conferences were held. The second congress of the Pan Indian Ocean Science Association was held in Perth, Australia, in August 1954. Ecology and demography were the most frequently discussed subjects. The association, headed by A. P. Elkin, meets next in Madagascar in 1957.

An international symposium on Man's Role in Changing the Face of the Earth was held at Princeton University in June 1955. The papers are being prepared for publication in 1956 by the Wenner-Gren Foundation, which sponsored the meeting.

A Symposium on Cross-Cultural Regularities was organized by Julian H. Steward at the University of Illinois in June 1955. Papers were presented by K. Wittfogel, E. Wolf, M. Harris, R. Murphy, R. Adams, and M. Fried. Tentative plans have been made for subsequent meetings. The papers presented at an earlier meeting of scholars with similar interests were published in 1955 in both Spanish and English editions. The English title is *Irrigation Civilizations: A Comparative Study*, Monograph No. 1 of *Ciencias Sociales* (Pan American Union).

Anthropologists are at work preparing the program for perhaps the largest meeting of the profession yet to be held. This is the Fifth International Congress of Anthropology and Ethnology, to be held in Philadelphia in the fall of 1956.

Medals and Awards.—The Frazer Lectureship in Social Anthropology, which rotates among Oxford, Cambridge, Glasgow, and Liverpool universities, was awarded in 1954 to I. Schapera. The 1955 award went to Raymond Firth. The Henry Myers Lecture of the Royal Anthropologi-

cal Institute, 1954, was delivered by E. E. Evans-Pritchard. The Huxley Memorial Medal and Lecture, 1954, went to Ralph Linton. His untimely death was followed by the appointment to this honor of Henri Vallois. The Viking Fund Medals and Awards, 1954, were: in general anthropology, Robert Redfield; in archaeology, William Duncan Strong; in physical anthropology, W. W. Howells.

ARAB LEAGUE. This organization of Middle East nations, whose inhabitants are predominantly Moslem in religion and Arab in culture, was formed in 1945. The member states in 1955 were Egypt, Iraq, Jordan, Lebanon, Libya, Saudi Arabia, Syria, and Yemen.

The purposes of the Arab League are to strengthen ties between participant states; to coordinate their political, social, and economic programs; to preserve their independence; and to consider in general the affairs and interests of the Arab countries and peoples. Headquarters are in Cairo, and there is a league publicity office in New York City. Abdul Khaliq Hassouna, former foreign minister of Egypt, has been secretary general since 1952. Each state has one vote in the Arab League Council, which may meet in any of the Arab capitals. The Political Committee of the council consists of the foreign ministers of member states.

In 1955 a number of special meetings and congresses were held. One was the Arab Conference on Free and Compulsory Education at Cairo. Another was a meeting of the Cultural Committee at Jidda, which discussed the teaching of Arabic in Eastern and Western countries. The Arab League Council approved Yemen's request for consideration of her dispute with Britain. The league also took a stand that French measures being taken in Algeria were threats to world peace and security.

With the signing of the defense pact between Turkey and Iraq on Feb. 24, 1955, there was great consternation among the Arab League members, and many observers stated that the Arab Collective Security Pact was a failure and that, by signing with Turkey, Iraq had killed the Arab League. Iraq, of course, denied this. Almost immediately, in an effort to rejuvenate the league, Egypt signed pacts with Syria and Saudi Arabia, and encouraged Lebanon and Yemen to join. The agreements proposed a unified command for their armies, which would be made ready to act collectively against any state which might attack any member nation. Egypt's later move to purchase arms from countries of the Soviet bloc presumably could bring Syria and Saudi Arabia into closer ties with the USSR. (See also articles on the Arab League countries.)

SYDNEY N. FISHER,
Professor of History, Ohio State University.

ARABIA. This peninsula in southwestern Asia (area, 1,180,280 square miles; est. pop., 13,000,000) is bounded by the Persian Gulf and the

Gulf of Oman on the northeast, the Indian Ocean (Arabian Sea) and the Gulf of Aden on the south, the Red Sea on the west, the Gulf of 'Aqaba on the northwest, and Iraq and Jordan on the north. Saudi Arabia and Yemen (qq.v.) are independent states and members of the United Nations; the state of Muscat and Oman is a semi-independent sultanate under British aegis. Aden Colony and Aden Protectorate (both British) are in the southwestern part of the peninsula, and Trucial Oman (Trucial States), Qatar, Bahrain (Bahrein), and Kuwait are British-protected states along the coast of the Persian Gulf.

Petroleum Resources and Development.—Production from Arabian fields was approximately 2 million barrels daily in 1955, exclusive of the fields in Iraq and Iran. Besides tankers exporting oil through the Persian Gulf, there are pipelines to the Mediterranean—from Saudi Arabia to Sidon (Saida), Lebanon, and from Iraq to Tripoli, Lebanon, and to Baniyas, Syria. After a lapse of three years oil was again exported in quantity from Iran in 1955 but the competition of these exports did not seem to curtail oil production in Arabia.

Oil concessions for all Saudi Arabia and the Persian Gulf waters off Saudi Arabia are held by the Arabian American Oil Company (Aramco), jointly owned by four American companies (see SAUDI ARABIA). The concession for Bahrain is held by the Bahrain Petroleum Company, owned in equal shares by Standard Oil of California and the Texas Company. The Kuwait Oil Company is owned equally by the British Petroleum Company (formerly the Anglo-Iranian Oil Company) and the Gulf Oil Corporation. The oil concessions for Qatar, Muscat and Oman, and Trucial Oman are held by subsidiaries of the Iraq Petroleum Company (IPC); those for the neutral zone between Iraq and Saudi Arabia are divided between Aramco and IPC; and for the neutral zone between Kuwait and Saudi Arabia, between the American Independent Oil Company (AMINOIL) and the Pacific Western Oil Corporation (PACWES).

The International Marine Oil Company, owned by the Superior Oil Company of California, and the Central Mining and Investment Company, has the offshore rights around the peninsula of Qatar. The sheik of Qatar has granted an underwater oil concession in the Persian Gulf to the Shell Overseas Exploration Company, Ltd., which has formed a subsidiary company to exploit the concession. The British Petroleum Company possesses offshore rights from Trucial Oman, and IPC has the concession for Eastern Aden Protectorate. Two oil companies have been formed in Yemen, one German and one American, to develop oil resources. (See also PETROLEUM.)

Aden Colony and Aden Protectorate.—Aden Colony has an area of 75 square miles exclusive of the Kuria Muria Islands (30 square miles) and Kamaran Island (22 square miles), constituting a dependency of Aden, and Perim Island (5 square miles). Population (est. 1955) is 140,000. Aden Protectorate (112,000 square miles) comprises 16 units (7 sultanates, 6 sheikdoms, 1 amirate, 1 confederation, and 1 sharifdom) in the western group, which has a population of approximately 350,000 and an area of 45,000 square miles; the eastern group of five protectorate states (Hadhramaut) has a population of 300,000.

The governor of the colony (Sir Tom Hickinbotham, appointed in 1951) is assisted by a 6-member Executive Council and a 16-member appointed legislative council which has legislative initiative except in matters of taxation and Orders in Council. The governor has absolute veto power. The executive branch has a number of departments whose heads and key officials are British

and members of the Overseas Service. The law is still that of British India, and one judge serves as the Supreme Court of Aden. There are no Moslem courts in Aden. The sultanate of Lahej, bordering on Aden, is the most progressive of the political units. It has a written constitution vesting legislative power in the sultan and a 21-member appointed council which can be changed to an elective body. The Eastern Aden Protectorate differs from the western in that it has greater cultural ties with India, Indonesia, and Malaya. The sultanate of Shihr and Mukalla is under Salih ibn Ghalib al-Qu'aiti, and the sultanate of Say'un is under Husayn ibn Ali al-Kathiri. Other divisions are the sultanate of Qishn and Socotra and the sultanates of Wahidi in the west and Mahra in the east. In the Kathiri and Qu'aiti states many of the government personnel are Pakistanis and Sudanese.

Aden, the capital (pop., 98,000, including surrounding area), is the third busiest port in the Commonwealth of Nations (second only to London and Liverpool), and is the major distribution center of western goods for East Africa and all southern Arabia. In 1954 the port was entered by 4,816 ocean ships with a total tonnage of over 21 million. The port is duty-free, but there are excise taxes on terminal consignments of tobacco, wines, spirits, and gasoline. Imports were valued at £64,883,735 and exports at £44,347,635 in 1954. Salt and fish are the only two exports from Aden that originate there. In 1954, 193,000 tons of salt were exported, all to Japan, and over 2,000 tons of fish were exported to Ceylon, West Germany, and East Africa. Overland trade with the protectorate is carried over desert tracks by truck and camel caravan.

Six airways serve Aden and connect with worldwide flights and Middle Eastern and African locations. These are Aden Airways, Arab Airways, Ethiopian Airlines, Air India, Alitalia (Italian), and Misr Air (Egyptian). Air transport for the protectorate has been developing quickly owing to the lack of roads.

In 1952 a 5-year Colonial Development plan was originated, financed from general revenue, from Great Britain, and from a 20-year loan. On April 1, 1955, the balance in the development fund was £2,289,679. In 1955 a project of 1,520 modern apartments (63 units of 24 apartments each) was being completed for the expanding population. Other projects are for schools and irrigation.

Aden Petroleum Refinery (British Petroleum Company) was finished in 1954, and has a capacity of 5 million tons of crude oil annually. In 1955 it operated at 75% capacity. Aden, for its size, is the wealthiest of all British colonies and has sufficient cash reserves to operate for two years.

In 1955 guerrilla warfare broke out in the Qu'aiti sultanate when British trucks began carrying foodstuffs eastward and took away the business from native camel caravans. British troops were flown to Aden from Suez as other revolts were imminent in Lower Awlaqi sultanate and Upper Awlaqi sultanate. The Aden government accused Yemen of supplying arms and fomenting rebellion. Also in 1955, Petroleum Concessions Ltd. (IPC) discovered oil at Nabroht in Eastern Aden Protectorate.

Bahrain or Bahrein.—This sheikdom consists of one large island (Bahrain) and several small islands in the Persian Gulf, 20 miles off the coast of the Saudi Arabian province of al-Hasa. Its area is 213 square miles, and its population is about 120,000. Sheik Sir Salman ibn Hamad al-Khalifa (accessed in 1942) resides at Manama (pop. 40,000) on Bahrain. There are several British officers in his service, including Sir Charles Belgrave, his chief adviser since 1926. Bahrain is the headquarters of a British political agent for the sheikdom, as well as of the British resident for the Persian Gulf. Detachments of the British Navy and the Royal Air Force are stationed on the island of Muharraq near Manama. Iran claims sovereignty over the sheikdom, which has been under British protection since 1820.

The Bahrain Petroleum Company produces 30,000 barrels of oil daily and refines crude oil from Saudi Arabia. The latter oil reaches the Awali refinery (200,000 barrels daily capacity) through the largest underwater pipeline in the world. In 1952 the sheik began to receive oil royalties under a 50-50 profit-sharing agreement, and in 1954 his oil income was £2.5 million. Other income was about £1 million.

Slightly more than half of the Moslems are Shi'ites, and disorders between them and the Sunnites are frequent. Education is not compulsory because there are not enough schools. There is a labor shortage and it is difficult to find domestic servants. The minimum daily wage is 5 rupees. The Muharraq airfield is used by international airlines.

Kuwait.—This sheikdom (about 6,000 square miles; pop., 200,000) is at the head of the Persian Gulf between Iraq and Saudi Arabia; in part it is separated from the latter by an uninhabited neutral zone of about 3,000 square miles. Sheik Abdallah al-Salim al-Sabbah (accessed in 1950) resides at the seaport of al-Kuwait (pop., about 150,000). He rules with the aid of a council of nobles and elders. The minister at the head of each department is a member of the ruling family. Oil revenues are allocated evenly among current expenses, develop-

ment, and investment. There is no local currency. Indian rupees are the legal exchange, and foreign exchange is controlled by Great Britain. At the official rate, £1 equals Rs.13.4, on the free market, \$1 equals Rs.4.875.

The proved oil reserves of Kuwait are about 15% of the world's known reserves. The Kuwait Oil Company has the concession for all oil in the state until the year 2009, and AMINOIL and PACWES have the concession in the neutral zone. The sheik receives as large a share of the profits as any company pays any other Middle East state (50% in 1955). In 1954, oil royalties were over £60 million, and production was 347 million barrels, 11% above 1953. One third of the oil income is being put aside by the sheik, who has an investment board in London which invests the savings. There is a 6-year development program (1952-58) to cost \$410 million, but in March 1954, new development projects were suddenly suspended, creating great confusion in business circles. Later in the year a new housing program was launched. The first water distillation plant, with a capacity of 1 million gallons per day, went into operation in 1954, and the pipeline to bring water from the Shatt-al-Arab in Iraq was given top priority.

There is great enthusiasm for education, and progress is being made in this field. A large number of Egyptian, Iraqi Lebanese, Syrian, and Palestinian (but not Western) teachers are employed. Foreign interference in education is not allowed, although guidance from Egypt has been sought. A modern university has been built, but boys tend to leave school before they reach the upper levels.

Muscat and Oman or Oman.—This sultanate (82,000 square miles; pop., about 750,000), lying at the south-eastern corner of Arabia, is technically independent. The British government is represented by a consul who reports to the political resident in Bahrain, and a Briton is minister of foreign affairs. A 1951 treaty of friendship, commerce, and navigation governs relations with Britain. Sultan Sayyid Said ibn Taymur ibn Faysal (ascended in 1932) resides in Muscat (pop., 4,200); nearby Matrah (8,500) is the commercial center. Petroleum Development (Oman) Ltd., a subsidiary of IPC, holds Muscat and Oman oil concessions. Other chief products are dates, fish, limes, and pomegranates; camels are raised. In June 1955, a raiding attack was made upon Oman with regard to oil. Imam Ghalib ibn Ali appealed to the Arab League and the United Nations for investigation.

Qatar.—This sheikdom (about 5,000 square miles; pop., 20,000) is a great barren peninsula on the Persian Gulf north of Trucial Oman. A British political officer, under the political agent at Bahrain, resides at Dohah (pop., 10,000), capital of Sheik Ali ibn Abdallah ibn Qasim al-Thani, who also has a British adviser. Qatar Petroleum Company, associated with IPC, has its headquarters at Dukhan in the center of the oilfield about 60 miles from Dohah on the west coast of the peninsula. The senior staff of the company is British and American; clerks and artisans are Indians, Iranians, Pakistanis, Lebanese, and Palestinians; unskilled labor is local. The company has developed a port at Umm Said on the east coast 19 miles south of Dohah. The sheik's oil income in 1954 was about £5 million. Shell Company of Qatar, which holds the offshore oil concessions, has its camp and installations near Dohah, which is becoming a busy modern town.

Trucial Oman or Trucial States.—This territory (6,000 square miles; pop., 115,000), extending for 400 miles along the southern end of the Persian Gulf, is composed of the seven sheikdoms of Abu Dhabi, Dubai, Sharjah, Ajman, Umm-al-Qaywayn, Ras al-Khaymah, and Kalba. A British political agent under the authority of Bahrain is stationed at Sharjah, where there is a detachment of the Royal Air Force; Dubai is the chief port. Pearl fishing and the raising of dates and sorghum are the chief occupations. Petroleum Development (Trucial Coast) Ltd., a subsidiary of IPC, holds the oil concessions, and in 1954 a strike was made in Abu Dhabi.

Since 1949 a dispute over the potentially oil-rich Buraimi Oasis has been raging with Saudi Arabia. The oasis borders Saudi Arabia, Muscat, and Abu Dhabi. In 1955 the Buraimi Arbitration Tribunal opened hearings regarding the dispute on September 11. Great Britain, which controls foreign relations for Muscat and Abu Dhabi, accused Saudi Arabia of bribing tribesmen with several million pounds and using pressure upon some of the arbitrators when the decision was being drawn. As a consequence, Sir Reader Bullard, British member of the tribunal, resigned. In October 1955, troops from Muscat, Abu Dhabi, and Trucial Oman, led by British officers, occupied Buraimi. Saudi Arabia protested, claimed that its police force had been attacked, and announced it would report the affair to the United Nations. Great Britain announced that all Saudi Arabian persons in Buraimi would be repatriated.

SYDNEY N. FISHER,

Professor of History, Ohio State University.

ARCHAEOLOGY. World archaeological research is reviewed below in two sections: (1) Western Hemisphere; and (2) Eastern Hemisphere.

For related activities, see ANTHROPOLOGY and the Index entry, Archaeology.

WESTERN HEMISPHERE

American archaeology continued to prosper and expand in 1955, and the many surveys conducted will pave the way for excavations in coming years. A relatively new branch—colonial archaeology, or the excavation or restoration of early European settlements in America—has come into prominence and seems destined to take its place alongside the more traditional fields of archaeological research in the Western Hemisphere.

Arctic.—Henry B. Collins of the Smithsonian Institution continued his researches at the Sadlermiut and Dorset sites at Native Point on Southampton Island. Both sites are extensive and should reveal for the first time an adequate picture of the two cultures.

Richard MacNeish of the National Museum of Canada surveyed the Arctic coastal region between Tuk-tuk, just east of the MacKenzie River, and the Canadian-Alaskan border. A major discovery was the site of Engitsciak, artifacts from which belong to the Denbigh Flint Complex.

William Irving tested several sites around a large lake some 40 miles east of Howard Pass in the Brooks Range. The evidence suggests long and intensive human occupation in that area.

Canada.—Charles E. Borden of the University of British Columbia carried out salvage excavations at the Fraser midden near Vancouver. A projected hotel will complete the destruction of the mound, already looted by amateurs. Borden also tested the important interior Tsimshian site of Gitsumkalum on the Kalum River.

Thomas E. Lee of the National Museum of Canada found evidence from the site of Sheguiandah on Manitoulin Island which suggests that the quartzite blade industry, heretofore known from George Lake, may be of later date than was previously suspected.

United States.—In the field of early man, the University of New Mexico continued work at the Leucy site in the Estancia Valley, N. Mex. Clovis, Sandia, and other preceramic point types were found in association with elephant, bison, horse, and mastodon bones.

Mark R. Harrington of the Southwest Museum reinvestigated the Tule Springs site in Nevada. Radiocarbon tests showed that charcoal from the site is more than 23,800 years old. Harrington states that human cultural remains were directly associated with the ash beds. Extinct fauna, principally camel, were found at the site. Elsewhere in the United States, William Ritchie of the New York State Science Service and State Museum excavated burials at Rockway Point above the St. Lawrence River. The burials belonged to three distinct periods, ranging from Late Archaic to Late Woodland.

Hale G. Smith and Charles Fairbanks of the Florida State Museum excavated a Weeden Island II burial mound on Ochlockonee Bay. Clemens DeBaillou began final work on the Cherokee capital of New Echota in Georgia to determine the relationship of official buildings to the road system, the Cherokee Phenix print shop, and other structures. The National Park Service, the Virginia Jamestown Commission, and the federal Jamestown-Williamsburg-Yorktown Celebration Commission have made a number of discoveries at Jamestown which throw new light on the first permanent English settlement in North America.

James A. Ford of the American Museum of Natural History conducted excavations at Poverty Point, La. Some microliths recovered from the gigantic octagonal mound have typological resemblances to artifacts of the Upper Paleolithic of Europe.

Reynold J. Ruppé excavated nine burial mounds in Iowa, probably dating from Late Archaic to Late Woodland times. One campsite shows affiliations with the Amana culture.

Jack T. Hughes of the Panhandle-Plains Historical Museum in Texas has excavated sites which show signs of Pueblo-Caddo mixture. These sites bear directly on the problem of the relationship between the Southeast and Southwest. Clement Meighan of the University of California at Los Angeles carried on excavations for a second year at a large village site near Paragonah, Utah. Adobe granaries and pit houses were uncovered.

William J. Wallace of the University of Southern California carried out salvage operations at Malaga Cove, a key site in southern California, which was leveled to make room for a housing development. Edith Taylor and Wallace conducted excavations at a large site in the Vermillion Valley, Fresno County, Calif. They found remains of modern Indians and of prehistoric, dart-using peoples.

B. Robert Butler supervised continued excavations at the Wakemap mound on the Columbia River. L. S. Cressman of the University of Oregon excavated the Five Mile Locks site on the Columbia River. Faunal and geological evidence from the bottom of the 23 feet of occupational deposit suggests a terminal Pleistocene date for the earliest occupation of the site.

Middle America.—The Dirección de Prehistoria of the Mexican government's Instituto Nacional de Antropología e Historia excavated a second mammoth at Iztapan in the dry beds of Lake Texcoco. One of the three artifacts associated with the mammoth resembles the ancient Angostura point of the North American Great Plains, and the other two would be classified in Europe as Solutrean.

J. Charles Kelley of the Southern Illinois University excavated near Durango the Schroeder site, the basic affiliations of which are with the Chalchihuites culture. Students from Mexico City College continued their work at Yagul, which proves to be almost a twin of Mitla. Dr. Waltraut Hangert of Germany, Philip Drucker of the Bureau of American Ethnology, and Eduardo Contreras of the Instituto Nacional de Antropología e Historia carried out joint excavations at La Venta, where half a dozen important sculptures were unearthed.

In the Maya area, the Belize Valley Expedition of the Peabody Museum of Harvard, directed by Gordon Willey, was in British Honduras for the third season. The Carnegie Institution of Washington completed its final season at Mayapan.

Alfred M. Tozzer of the Peabody Museum and Harvard University died Oct. 5, 1954. For more than 50 years he was a leader in Middle American research.

South America.—Fernando Altenfelder Silva of the University of Paraná excavated Estirão Comprido, a site on the Rio Ivaí, which should provide information on the prehistoric sequence in a part of southern Brazil that is archaeologically almost completely unknown. Vilma Chiara of the Museo Paulista, reported on a site on the Rio Solimões, Brazil, where the ceramic complex is

unlike anything previously recognized in the Amazon area. Julio Cesar Zerboni of the Instituto Nacional de Colonización in Uruguay excavated three mounds in a salvage operation. The mounds, of a type previously found in nearby Uruguayan localities, may be associated with the Arechane Indians.

Clifford Evans and Betty J. Meggers of the United States National Museum have isolated for the first time evidence of cultural affiliations between lowland Ecuador and the early cultures of Peru.

John H. Rowe and associates from the University of California at Berkeley continued a program of research on Peruvian highland and coastal cultures, with special reference to the Nazca, Ica, Tiahuanaco, and Inca sequences. Col. Hans Rudel explored ruins on Llullaillaco, a high peak on the Chilean-Argentinean frontier. In Bolivia, Alfred Kidder, 2d of the University of Pennsylvania conducted excavations in an attempt to clarify the origin of the Tiahuanaco culture.

Thor Heyerdahl is leading a 10-month expedition to eastern Polynesia. While Easter Island will be emphasized, Pitcairn Island, Mangareva, the Tubuai group, and the Marquesas will also be studied.

RICHARD G. FORBIS,
Department of Anthropology, Columbia University.

EASTERN HEMISPHERE

The year's most important archaeological discoveries in the Eastern Hemisphere were made in southwestern Asia where the spade of the excavator continues to throw light on ancient history. Other significant finds are summarized, by continents, as follows:

Europe.—Thomas C. Lethbridge discovered two "earth giants," each about 200 feet long, cut into the chalk of the Cambridge uplands. They depict a goddess with her horse and an ancient British warrior giant beside his chariot. The former appears to be Belgic (1st century B.C.).

In a Roman villa at Isca near Caerleon, Monmouthshire, V. E. Nash-Williams found a mosaic gaming board with 16 panels and 60 coins of the late 4th and early 5th centuries.

In southeastern Kent, behind Folkestone, 36 graves, presumably Jutish, were discovered by Alan Warhurst. From the 100 gold and silver ornaments, this cemetery is dated in the 6th century A.D., probably following the invasion by the Angles and Saxons under Hengist and Horsa.

Near Halle in Germany, a Neolithic site has yielded wheat and domestic animal bones.

Africa.—C. B. M. McBurney found a human mandible in Haua Etah cave in Cyrenaica. Believed to be about 40,000 years old, this discovery will shed light on the relationship between Neanderthal and modern man in North Africa.

In Egypt the so-called "solar boat" discovered by Kemal el-Mallek in May 1954* is being moved into a permanent building beside the pyramid of Khufu (Cheops). Mohammed Zakaria Ghoneim continued work at Saqqara, where the royal burial chamber in the center of the Step Pyramid, completed about 2750 B.C., contained an empty sarcophagus. At Memphis near Cairo, the University of Pennsylvania Expedition cleared the Rameses II temple. Two graves (800-700 B.C.) yielded gold ornaments, including an amulet of the god Ammon.

At Bahr el-Ghazali in the Anglo-Egyptian

* See THE AMERICANA ANNUAL, 1955, p. 220.

Sudan, the former commissioner for archaeology, Peter L. Shinnie, excavated a stone church and monastic buildings surrounded by a massive stone wall. A section of the north wall lay flat, as though deliberately pushed over. Nearby was a bathhouse with a water tank inside the open dome; this was of a type not previously known in the Sudan. In addition to medieval Nubian pottery, several Coptic and Greek tombstones were unearthed. These suggest that Bahr el-Ghazali was a Coptic monastery because the Nubian church used Greek as its Liturgical language and for funerary inscriptions.

A French expedition led by Jean Vercoutter conducted excavations at the New Kingdom town of Kor on the west bank of the Nile near Wadi Halfa. Robbers from Karnak had pillaged the site about 30 years ago.

Near Saldanha in Cape Province, South Africa, M. R. Drennan and R. Singer found part of a large human lower jaw similar to that of Heidelberg man. Four years ago they had found a fossil calvaria at this site. Raymond Dart excavated extremely primitive stone artifacts at Makapan in the Transvaal. Since these tools were collected in river deposits immediately over strata which yielded remains of the Australopithecines (ape men), it would seem probable that we are not dealing with an ape, but with an early form of man.

Asia.—The year's principal discoveries were made in Syria. Carleton S. Coon excavated a Stone Age skeleton from a cave near Palmyra. At Ras Shamra (ancient Ugarit), Claude Schaeffer explored the eastern and southern wings of the royal palace, one of the largest residences known in the ancient Near East. The area cleared covered nearly 30,000 square feet. Excavations during 25 years have revealed that Ugarit was inhabited from before 3000 B.C. until its final destruction about 1,800 years later. A harbor town, Ugarit became the capital of a Canaanite or proto-Phoenician kingdom about 1900 B.C. During the last centuries of the 2d millennium, the scribes wrote their own Canaanite language, which we call Ugaritic, in the earliest alphabetic script known. However, state documents were written in Babylonian, the old syllabic script of Mesopotamia. The inhabitants of Ugarit were in correspondence with those of Egypt, Cyprus, Greece, Anatolia, and the Tigris-Euphrates Valley.

Among important objects found during the past season were an ivory portrait head of one of the kings of Ugarit, wearing a helmet inlaid with gold and silver. A small kiln for baking cuneiform tablets had collapsed with 100 documents in it, some incompletely fired. Most of these were written in the Ugaritic script, but several of the tablets contained the texts from neighboring monarchs addressed to the kings of Ugarit, probably translations from the Babylonian, the diplomatic language of the period. They are addressed to Hammurabi, last known king of Ugarit; he had the same name as the king of Babylon, who reigned about 2100 B.C. This indicates that the royal house of Ugarit might have been of Babylonian origin.

Near the kiln was unearthed a bronze sword, engraved with the name of Mineptah, successor of Rameses II, in Egyptian hieroglyphs, suggesting that this pharaoh ordered weapons from the Ugarit arsenal. Other letters in the kiln indicated active sea trade. In addition, there were inventories of minerals and other goods, such as salt, wool, cereals and oil. One order for 1,000 jars

ISRAEL OFFICE OF INFORMATION

Ruins of Herod's Palace at Masada, Israel, near western shore of Dead Sea, showing three levels of construction.

of olive oil was recorded. The nearby archive room contained 200 tablets in Babylonian cuneiform, the majority being treaties and other documents, such as royal letters and commercial agreements. Each tablet is stamped with the Royal Hittite seal or with that of the kings or officials of Amurru of Carchemish. The seal inscriptions are in Babylonian and hieroglyphic Hittite, the latter only partially deciphered. These excavations at Ras Shamra have thrown great light on the ancient history of the Near East. Future work may yield the clues to the complete decipherment of the Ugaritic tablets.

On the summit of Mount Nimrud (7,400 feet) in the Anti-Taurus Mountains southeast of Malatya in Turkey, F. K. Doerner and Theresa Goll obtained evidence of Hittite influence in two royal tombs of the Hellenistic kingdom of Commagene, an independent state founded during the 1st or 2d centuries B.C. and incorporated in the Roman Empire by Vespasian in 72 A.D. Several Mount Nimrud figures wore typical Hittite pointed headdresses, although their clothes were characteristically Greek and Persian. These headdresses are of especial interest, because the last great Hittite Empire was overthrown in the 12th century B.C., although cultural survivals continued in the Commagene region into the 7th century B.C. Lions, also of Hittite type, adorn wall reliefs in two courts. While searching on nearby Mount Kahta for the tomb of Antiochus I, king of Commagene, and that of his father, Mithridates II, the excavators found an 8-foot stele bearing a Greek inscription warning, "Those who come to plunder will suffer dire consequences." Despite this warning, the search for these tombs will continue, using modern geophysical equipment.

At Beycesultan in western Turkey, the British Institute of Archaeology continued its investigation of a large Bronze Age palace of the Arzawa culture. New discoveries include remains of a heating system and pottery, which places the date of the building before 1800 B.C.

An expedition under the direction of Michael Avi Yona of the Israeli government's Department of Antiquities made a brief survey of the fortress palace of Herod the Great (king of Judea, 37-4 B.C.) at Masada, a high rocky hill near the western shore of the Dead Sea. Remains of a banquet hall, including frescoes and parts of columns, were uncovered. Deep in the rock on which the palace stood were large cisterns.

In West Pakistan, the Peabody Museum-Har-

vard University Expedition (led by the writer) discovered new evidence in Makran linking southwestern Asia with the Indus Valley civilization. At Paharpur in East Pakistan, the ruins of the largest Buddhist monastery south of the Himalayas were cleared. Many terra cotta panels with spirited figures of archers, acrobats, and animals were unearthed. Brahmanical motifs, especially from the Krishna legend, illustrate the growing influence of indigenous elements on the last phases of Buddhism on the Indian subcontinent.

At Angkor in Cambodia, Jean Laur has begun to clear part of this vast, jungle-covered Khmer city, built in stone about 900 A.D. and abandoned in 1342. Rebuilding of the most important monuments is under way.

Excavations have been resumed at Choukoutien, home of the Peking man. From western China, skull fragments of a late Pleistocene young girl were described by W. C. Pei as of modern type. These are the first fossilized human bones from that part of China.

HENRY FIELD,

Curator of Physical Anthropology, Field Museum of Natural History, 1926-42; Research Fellow, Harvard University, 1950—; Author of "The Track of Man" (1953).

ARCHERY. See SPORTS, GAMES, AND SHOWS.

ARCHITECTURE. Building construction continued its unprecedented pace in 1955, attaining a volume of \$19.1 billion in the United States for the first six months. This surpassed the \$16.7 billion for the same period of 1954 by 14 per cent, and government estimates indicated a total volume of \$41.8 billion for the year. (See BUILDING AND CONSTRUCTION.)

In construction, interest in shell concrete and thin, warped surfaces increased, stimulated by the work of brilliant innovators such as Candela in Mexico and Baroni in Italy. Plastics continued their invasion of the building field and seem certain to play an increasingly important role, especially in shell forms; and the more general use

Interior view of Danforth Chapel, designed by James Hunter for Colorado A. & M. College, Fort Collins, Colo.

REYNOLDS PHOTOGRAPHY, INC.

of porcelain enameled walls added color to the monochromatic appearance of many city streets.

Honor Awards.—Among outstanding buildings for the year, 27 were designated for Honor Awards by the American Institute of Architects (AIA). Of these, five received First Honor Awards, namely: U.S. Embassy, Stockholm, Sweden, by Ralph Rapson and John van der Meulen; Central Restaurant Building, G. E. Technical Center, Warren, Mich., and the Women's Dormitories and Dining Hall at Drake University, Des Moines, Iowa, by Eero Saarinen and Associates; North Hillsborough (Calif.) Elementary School, by Ernest J. Kump; General Telephone Co. of the Southwest, San Angelo, Texas, by Pace Associates (Charles B. Genter, architect in charge).

Urban Redevelopment.—Expressive of the urgency for broader architectural thinking, "Designing for the Community" established the theme for the annual meeting of the American Institute of Architects in Minneapolis in June 1955. At this meeting some 1,600 architects heard the plight and blight of cities discussed and were challenged to begin the overdue urban renewal. Undeniable progress toward this goal is apparent, but the significant examples are still pitifully few in comparison with the enormous need. Philadelphia is perhaps the best example, with its bold plan for the redevelopment of 11 square miles. In Penn Center, one of the first replanned areas, the year saw completion of the Uris Building, by Emery Roth & Son, and the start of the Transportation Center, by Vincent Kling. (See also CITY PLANNING.)

Office Buildings.—These seemed more socially conscious in 1955, as more corporations were willing to spend more money to obtain significant or exceptional buildings, and showed greater concern for the civic space about their buildings.

In addition to the 41-story Chicago Prudential Building, by Naess and Murphy, the year witnessed the completion of Prudential buildings in Jacksonville, Fla., by Kemp, Bunch, and Jackson, and in Minneapolis, Minn., by Magney, Tustler, and Setter. In Chicago the proposed 17-story Inland Steel Co. Headquarters, by Skidmore, Owings, and Merrill, features open office space of maximum flexibility. By locating the supporting steel columns on the exterior, and housing elevators and services in an adjacent stainless steel tower, the office floors attain the surprising area of 177 by 58 feet unobstructed by interior supports. In the design proposed by Mies van der Rohe for Seagram's 38-story Park Avenue building, New York, the metal and glass shaft rising from a handsome plaza promises a welcome change from the stepped pyramids so frequently seen.

Residential.—In private home building, 1955 was expected to set the all-time record for dollar volume at \$14.6 billion, although housing starts were expected to be fewer than the record 1,352,000 units in 1950. (See HOUSING.) Architectural emphasis was on plan ingenuity, the straightforward use of materials, a reduction of glass area, and an increase in privacy. The O'Brien house in Shreveport, La., by R. Neutra, and the Thorne house in Austin, Texas, by Gommel Roessner, are illustrative. The E. F. Catalano house in Raleigh, N.C., by the owner-architect, was one of the most unusual with a square double-twisted wood roof only 2¼ inches thick but spanning 87 feet.

Educational.—Probably never before has there been a greater search for architectural quantity, quality, and economy in school construction. Il-

A. I. A. AND ATELJE SUNDAHL AB; M. I. T. NEWS SERVICE

(Left) American Embassy in Stockholm, Sweden, designed by Ralph Rapson and John van der Meulen. (Right) Interior view of dome-shaped Kresge Auditorium, Massachusetts Institute of Technology, designed by Eero Saarinen.

lustrative of this trend is the Riverview Gardens Senior High School in St. Louis County, Mo., by Hellmuth, Obata, and Kassabaum, in which the "little school" concept is imaginatively developed. Designed to grow with the pupil load of the community, as finances permit, it consists of a series of separate high schools for 600 pupils each. As the initial unit is doubled or tripled, specialized spaces such as gymnasiums and cafeterias will be added.

In institutions of higher learning, contemporary architecture has made significant contributions. The new Architecture Building and the Library at Georgia Institute of Technology, Atlanta, by Bush-Brown, Gailey, and Heffernan, are clear and shapely answers to the architectural problems encountered. In Cambridge, the Massachusetts Institute of Technology dedicated its dramatic auditorium by E. Saarinen and Associates. A thin concrete shell, one eighth of a sphere supported at three slender points, it placed heavy demands on 1955 technology to solve the difficult problems of structure, equipment, and acoustics imposed by its daring and imaginative design.

The most controversial design of the year was undoubtedly that proposed by Skidmore, Owings, and Merrill, for the U.S. Air Force Academy, Colorado Springs, Colo. Plans for contemporary buildings of glass, aluminum, and steel aroused such opposition that Congress refused to vote the necessary funds until modifications were introduced. Construction of the buildings is expected to take at least two years.

Ecclesiastical.—The year 1955 also marked an all-time high in the number of churches erected. Approximately one fourth of these are contemporary in style. The best have a spirit of reverent simplicity, a creative newness without striving for effect, as in the small chapel by James M. Hunter, for Colorado A. and M. College. Paul Schweikher's interesting design for the Grace Lutheran church-school complex, at Teaneck, N.J., was awarded first place in its category by the Church Architectural Guild. Another notable design for a religious building group is that by Marcel Breuer for the projected transformation of St. John's Abbey at Collegeville, Minn.

Architecture Abroad.—Recent United States government buildings on foreign soil give reassurance about the prestige of American architects abroad. The U.S. Embassy in Stockholm, previously mentioned, elicited general praise from European architects. Edward Stone's design for the U.S. Embassy in New Delhi, India, and that by Hugh Stubbins for the U.S. Legation Building in Tangier show remarkable sensitivity to lo-

cal conditions and traditions while meeting the requirements of the program in a contemporary manner.

The construction boom in the United States was paralleled by similar activity in many other economically stable countries. The following, to name only a few significant examples, are suggestive of trends: the Neighborhood Development for Municipal Employees in Rio de Janeiro, by A. F. Reidy; Le Corbusier's chapel, Notre-Dame-du-Haut, in the Vosges mountains, and his work at Chandigarh, capital of Punjab, India; the Convention Hall at Matsuyama and the Shizuoka Printing Plant at Numazu, Japan, both by Kenzo Tange.

ARCHIVES, National. See NATIONAL ARCHIVES AND RECORDS SERVICE.

ARCTIC EXPLORATION. There has been intense activity in Arctic North America during the past year. Much of this activity has been connected with construction of the Distant Early Warning (DEW) radar line along the northern fringes of the Arctic mainland. Although this work has involved little true polar exploration, the choice of sites for the stations, and the movement of men and materials into areas rarely visited before, has led to a broad accumulation of knowledge.

The biggest changes occurred in polar transportation. In the spring, major airlifts were made to northern airstrips from a number of points in southern Canada and the United States. In the summer, convoys of ships moved into Arctic waters carrying the bulkier materials. Unfortunately they met the worst ice conditions that have been observed this century. In most areas the sea ice was late in breaking up, and on some coasts it failed to go out during the summer. The sea ice also made the annual resupply of northern weather stations difficult, and some had to be supplied by aircraft. Farther south, detailed knowledge of broad areas of subarctic Canada was obtained with the construction of the Mid-Canada radar warning line.

Aircraft in Exploration.—Development of helicopters and more conventional aircraft has led to rapid progress in certain fields of Arctic scientific exploration in recent years. In 1955, the Geological Survey of Canada continued its reconnaissance activities using helicopters. Operation Thelon, west of Hudson Bay, and Operation Franklin, in the Queen Elizabeth Islands, were success-

fully completed. Two large transport helicopters were used in the northern islands, and they enabled large areas to be examined which had never been seen before. Farther west in the Brooks Range of northern Alaska, the topographic division of the U. S. Geological Survey used helicopters to establish ground control survey points. Aircraft flying at 30,000 feet photographed this area and the Arctic coastal plain, using a special form of low oblique, twin-lens camera for the preparation of a new edition of the 1:250,000 map of northern Alaska.

In Canada the trimetrogon air photography of the northlands is virtually complete, and a new program of vertical photography has been initiated. This photography will be flown by high-speed aircraft operating at 35,000 feet. The initial photographs show a remarkable improvement on earlier ones, and more accurate maps may be expected from them.

Aircraft were also used during the spring to take a census of the Canadian barren-ground caribou population. Although the detailed figures have not yet been published, it is known that there has been another serious decrease in caribou numbers since the last count in 1948.

Exploration in Greenland.—The first results from the 1952-54 British North Greenland Expedition became available during the year. They show that beneath the ice cap in northern Greenland, the land is in places below sea level, although the surface of the ice is over 9,700 feet above the sea. Exploration on the east coast of Greenland was handicapped by poor ice conditions which caused the sinking of one ship. However, an expedition led by Lauge Koch was able to continue its geological work begun in previous years. In northwestern Greenland, United States military groups continued their research into construction in snow and ice, and reported that the building of facilities and roads below the surface of the Greenland ice cap was feasible.

Scientific Research.—As in all other years since 1945, there were many small parties operating throughout the Arctic. In the archaeological field, the investigation of the Cape Dorset culture on Southampton Island was continued for the second year; and Dorset sites were discovered for the first time in the western Canadian Arctic. There were no major expeditions in the Arctic in 1955; the first can be expected during the International Geophysical Year, 1957-58. (See also *ARCHAEOLOGY—Western Hemisphere; GEOGRAPHY AND EXPLORATION.*)

McGill University, Montreal.

ARGENTINA. This largest of the Spanish-speaking countries of South America shares the southern part of the continent with Chile, from which it is separated on the west by the Andes. With an area of 1,084,362 square miles, Argentina extends 2,150 miles from the forested plains of its subtropical Chaco in the north to cold, wind-swept Tierra del Fuego at the continent's southern tip, but the land is best known for its great central pampas, where the rich alluvial topsoil reaches a depth of 11 feet. As of July 1, 1955, its estimated population was 19,101,788. Buenos Aires, the capital, has a population of 3,554,906 (Jan. 1, 1955); other leading cities are Rosario, Córdoba, La Plata, Tucumán, and Santa Fe.

Government.—After a constitutional change to permit his re-election, President Juan Domingo Perón began his second six-year term on June 4, 1952. Similarly, six-year terms are served by provincial governors and by senators and deputies in the bicameral Congress.

On Sept. 19, 1955, the Perón administration was overthrown, after which Argentina was governed, first, by a military junta; then by Maj. Gen. Eduardo Lonardi, who was sworn in as provisional president on September 23; and finally, on November 13, by Maj. Gen. Pedro Eugenio Aramburu. (See below, *Principal Events, 1955.*) The Peronist Congress and Supreme Court were both dissolved, and the country turned to the creation of a new government.

Religion and Education.—The prevailing religion in Argentina is Roman Catholicism and, under President Perón, the church received government support. In moves due to the suspected growth of a political Catholic Action (Christian Democratic) Party, the Peronist government withdrew that support in 1955 with results that were disturbing to the educational system and to the religious life of the nation. Funds traditionally used for aid to church schools were withheld, and there were transfers or arrests of teaching personnel. Some schools were closed, and even certain religious services were banned, on the ground that they served to cause unrest or to cover political maneuvers. By May the Peronist Party (Partido Peronista) was calling for a return to the old Argentine policy of separation of church and state. On May 20, two laws were passed, one of which made all religious institutions retroactively subject to taxation as of Jan. 1, 1955, while the other called for the election of a constituent assembly to rewrite the constitutional articles dealing with the state-church relationship. On June 2, another law abolished religious education in the public schools. Riots followed.

On June 11, some 100,000 Argentines held their Corpus Christi parade through downtown Buenos Aires despite a government ban. About 430 persons were arrested after a clash on June 12 between Peronists and a group guarding the steps of the Metropolitan Cathedral. On June 15, the government expelled from the country two of the highest Roman Catholic dignitaries on the charge that they had defied civil authorities and provoked disorder; the residences and offices of some 120 priests were then raided in a search for confirmatory evidence. On June 16, the Vatican announced the excommunication of the responsible government officials. A revolt a few hours later against the Peronist regime (see below, *Principal Events, 1955*) was followed by mob burning of several of the nation's most revered and beautiful churches. Minor clashes continued to occur after the suppression of the revolt, but the government had been left in full retreat from its extremist position.

Because of the close integration of the church with the nation's schools, the educational situation was left in a state of confusion strange in one of the world's most civilized countries. As of 1954, however, a total of 3,042,039 pupils were enrolled in the primary schools; there were 1,372 government secondary schools, with 576,231 pupils; and 137,709 students were attending the six national universities.

Economic Affairs.—In a survey of the national economy presented to Congress in May 1955, President Perón revealed that the 1954 gross national product was 125 billion pesos, with industrial production up 7% over 1953 and construction up 15%; 1954 government expenditures totaled 11,955.7 million pesos. The debt increase during the year was 7,950.6 million pesos.*

Argentina's economically active population rose in 1954 to 7.6 million, or 40.6% of the total population. Those employed in agriculture totaled 1,770,000; in industry, construction, and mining, 1,701,000; in trade and commerce, 1,230,000; in other activities, 2,899,000. Their cost-of-living index in 1954 stood at 605.7 (1943 = 100), and by the first quarter of 1955 the cost of living in Buenos Aires was about 17% higher than a year earlier.

Foreign earnings were cut by the drop in international commodity prices of grains and hides, and by the competition of foreign surpluses. Exports declined in 1954 to 6,721.4 million pesos, and imports rose to 7,111.6 million pesos, leaving an unfavorable balance of 390.2 million, as compared with a 1,522.1 million peso surplus in 1953. Great Britain was the principal market, followed by the United States, Germany, and Brazil, while the chief suppliers were the United States, Brazil, Germany, and Great Britain. The principal Argentine purchases were machinery,

* On October 27, a basic official exchange rate of 18 pesos to U.S. \$1 replaced previous multiple rates ranging from 5 to 20 pesos to \$1.

iron and products, fuel and lubricants, food-stuffs, lumber and products, chemicals and pharmaceuticals, metals and products (aside from iron), and jute and other fibers.

A remarkable trend was the reversal of the Argentine position toward foreign participation in national industry. Despite Argentine acceptance of a \$60 million loan to speed steel production, the signing of an automobile production contract with the Kaiser Motors Corporation, and a tentative agreement with the Standard Oil Company of California, foreign capital on the whole was still withholding itself in 1955 from Argentine commitment. The nonconfirmation of the oil contract and the downfall of the Perón regime brought new uncertainties.

The issuance in August 1955 of the government's first full statistics on the course of the Argentine economy since the Peronists took over in 1945 was a singularly timely summary of the Perón era. In terms of 1950 prices the gross national product was shown to have risen 37% from 1945 to 1954, as compared with a population growth of 22%. The index of industrial production rose from 76 in 1945 to 100 in 1950, but still stood at 100 in 1954. Although the construction index had risen from 62 in 1945 to 100 in 1950, it fell to 90 by 1954. Agricultural output, apart from grazing, increased by about one third, but beef exports declined with the decline in grazing.

On October 11, President Lonardi abolished the Second Five-Year Plan (1953-57), which he described as a "political instrument" of the Perón regime. A special study of the state of the national economy made by Dr. Raúl Prebisch, economic adviser to the president, revealed that under Perón the internal and external debt had increased to \$5,757 million.

Agriculture.—Excellent grain crops for 1953-54 plus heavy carry-overs increased Argentina's exports to 7.5 million tons, of which wheat accounted for about 3.2 million and barley and oats for 2.2 million. The 1954-55 harvest also was good, despite the need for more farm machinery and the adverse effects of drought, which damaged corn and sunflower crops. Grain production figures (in thousands of metric tons) were: wheat, 7,690; corn, 2,580; barley, 1,112; oats, 890; rye, 844; and linseed, 482.

On July 1, 1955, there was an exportable balance of 54,525 tons of wool. Beef production in 1954 amounted to 1,795,000 tons, which, with local consumption up to 1,555,000 tons, left only 240,000 tons for export. Subsidies of roughly 300 million pesos were distributed by the Argentine Trade Promotion Institute (IAPI), the government trading corporation, to meat-packing and processing plants to cover losses incurred in 1954. Despite the importance of its role in Argentina's foreign trade economy, IAPI has been losing hundreds of millions of pesos annually through bureaucratic control of crops and the depressed state of the international grain market. Losses in 1953 alone were 1,822 million pesos.

Industry.—Early results of the July 1954 national industrial census show that Argentina has an estimated 417,423 establishments in commerce, 181,763 in industry and mining, and 22,143 in the building trades, employing some 2,930,912 persons in all. Bankruptcy returns for 1954 reached a record 687,917,881 pesos, with textile factories again in the lead.

The chief industrial news for 1955 centered on the development of electric power, steel manufacture, and cement and automobile production. Argentina's electrical energy capacity is only

H. M. TALBURT—SCRIPPS-HOWARD NEWSPAPERS

"WHERE TYRANTS ALWAYS FAIL!"

2,418,000 kw., but the government has allotted 5 billion pesos for power projects scheduled for completion by 1960, and the Central Bank is allocating \$40 million for imports of generating equipment, which will give an added capacity of some 400,000 kw., about half for use in the Buenos Aires sector.

The Sociedad Mixta Siderúrgica Argentina, a big steel combine which is to erect and operate Argentina's great new plant at San Nicolás, has raised its capital to 3 billion pesos, of which 2.4 billion will be contributed by the government. In March 1955, the Export-Import Bank approved a \$60 million loan to help finance the project, but the final agreement was not signed in the post-Perón governmental confusion.

Cement production for 1954 was estimated at 1,683,200 metric tons, while consumption rose to 1,955,000; during the first six months of 1955 output totaled 872,000 tons.

The big automobile news of 1955 was the final signing of the contract between the Kaiser Motors Corporation and the Aeronautical and Mechanical Industries Corporation (IAME), confirming their October 1954 agreement for Argentine production of jeeps, sedans, station wagons, and trucks. The annual capacity of this cooperative venture will be 40,000 vehicles, with jeeps expected to be in full production by the end of 1957 and the other units by 1959.

Mineral Products.—Because of the \$200 million annual exchange drain for the purchase of petroleum products, oil is the mineral of greatest Argentine concern. In late 1954 a large petroleum reserve, with an initial output of 300 cubic meters of crude and 600,000 meters of natural gas daily, was located in the Province of Salta, near the Bolivian border. In July 1955, new oil deposits were reported from Tierra del Fuego, where a test well produced 503 barrels per day. Argentina's known crude oil reserves are estimated at about 325 million barrels, but domestic crude output is only about 80,000 barrels per day, as compared with a need for 200,000. Refining capacity is 186,100 barrels per day. A pipeline for the daily delivery of 660,000 gallons of oil from

WIDE WORLD

Argentine mob sets fire to Roman Catholic Episcopal Palace in Buenos Aires, following anti-Peronist revolt on June 16, 1955. The cathedral is at left.

Bolivia was opened on July 1, 1955, and 2,260,000 metric tons of crude are to be imported under the Anglo-Argentine trade agreement of March 31, 1955. What was to have been the major oil news of 1955—the contract for the development of Argentine oil resources signed on April 25 with the Standard Oil Company of California—failed to gain congressional approval, and it was also rejected by the Lonardi administration.

Transportation and Communications.—Monthly allocations of millions of pesos to make up deficits in transport on railways, ships, airlines, subways, buses, and streetcars—all run by the government—have become routine announcements in Buenos Aires. Plans for the modernization needed to cut the large losses on the 27,000 miles of railways (over 40% of the total trackage in South America) include an increasing use of diesel-electric locomotives.

A new 15-year highway construction program is supported by a law authorizing a 200 million peso annual bond issue and by the allocation of 558 million pesos in the Public Works Ministry's 1955 budget. As of 1952, Argentina had 30,376 miles of paved highways and 89,096 miles of other roads. Registered motor vehicles numbered 600,000 in January 1954.

On Jan. 1, 1954, Argentina had 1,001,158 telephones. There are 55 broadcasting stations and 1 television station in the country.

Principal Events, 1955.—Long discontent with the Perón government, sparked by its controversy with the Roman Catholic Church (see above, *Religion and Education*), broke out in open rebellion and the bombing of the Casa Rosada (the Argentine White House) on June 16. Although this revolt was promptly suppressed by army forces loyal to the government, it was followed by mob violence, and it was not until June 22 that Gen. Franklin Lucero, who had been placed

Peronist forces battle anti-Peron rebels in the streets of Buenos Aires on June 16, 1955.

WIDE WORLD

in command of the government's forces of repression, was able to return the president to at least nominal power.

There followed a strange pacification interlude when, on July 5, the president called for a political truce. Attacks on the church ceased; many political prisoners, students, and priests were released from jail; a "discreet" freedom of the press was assured; and on July 27, Arturo Frondizi, head of the Radical Party, was permitted to make the first opposition radio address in nearly 10 years. On July 15, the president announced his resignation as head of the Peronist Party and his decision to act merely as a constitutional president. The country was to enter a new phase of constitutional government, he said, with complete political freedom for all factions.

The Radicals, however, called for government reforms and the return of constitutional guarantees before any acceptance of political peace; a new, feared Christian Democrat Federal Union Party openly stated a platform of "real liberty and social justice"; the report of two new plots to assassinate Perón brought extensive new arrests; antigovernment demonstrations of Roman Catholic sympathizers continued; and elements in the armed forces were known to be hostile to the Perón regime. On August 31, the president presented to the General Labor Confederation and to his Peronist Party a well-staged offer to resign. Forewarned, Peronists were gathered to demonstrate a support obviously designed to counter army power. Perón easily complied with a request to withdraw his resignation. "Pacification" not only came to an end, but the individual Peronist was urged to a personal militant defense of the regime. "He who in any place tries to disturb order in opposition to the constituted authorities or contrary to the law or the Constitution may be slain by any Argentine," said President Perón. On September 1, his Congress obediently passed a bill imposing a state of siege on Buenos Aires, ending all constitutional guarantees for its citizens, and giving to the president the requested power to "annihilate" his foes. It became law when signed by Perón on September 2.

The new period which thus began with presidential incitement of his followers to take the law into their own hands was a direct challenge to the army leaders who had saved the regime in June and had worked to avoid civil war and maintain Argentine dignity. On September 9, five high army officers were indicted for conspiracy. On September 16, a new and more formidable revolt began in a series of outbreaks: at the Puerto Belgrano naval base, in the city of Córdoba, and in the army post at Curuzú-Cuatí. There was fighting in Paraná, Rosario, and Santa Fe; Bahía Blanca was captured by the rebels. In Buenos Aires itself the usual "terrorist plot" gave an excuse for the arrest of over 100 civilians. The revolt spread to the western provinces of Mendoza, San Luis, and San Juan, and minor units of the Argentine Navy turned up in the Río de la Plata to await the larger ships before beginning the bombardment of Buenos Aires threatened unless Perón resigned the presidency. On September 19, in a signed speech given to General Lucero to read, Perón offered his second resignation, prompted, he said, by patriotism and love of the people, "although my fighting spirit impels me to fight."

He had shown little fighting spirit or even courage, as evidenced by the care taken for his personal escape in the June revolt, by the conspicuous prudence of his secluded life during

the three dangerous months that followed, and by the speedy refuge sought in the sanctuary, first, of the Paraguayan embassy and then of a small Paraguayan gunboat presumably designed to carry him to the safety of exile.

On September 19, members of his government resigned, and on the following day military leaders began negotiations with the rebels. Maj. Gen. Eduardo Lonardi, chosen as provisional president, entered Buenos Aires on September 23, and the reorganization of the Argentine government began with his promise to restore civil liberties, maintain the real benefits which the workers had gained under Perón, seek a concordat with the Vatican, and hold new elections as soon as practicable.

Uruguay recognized the new regime at once, and the almost as prompt recognition by the United States followed, on September 25. On October 2, apparently despairing of any adequate safe-conduct along the 900-mile trip up river, Perón finally proceeded to Asunción, the Paraguayan capital, by plane. Behind him he left a divided country, shamed with the mounting evidence of the personal and official corruption of his regime, and faced with tremendous problems of reconstruction.

When President Lonardi's government, with its attempted reconciliation of all the divergent aspirations of the different classes of Argentine society which had been pitted against each other, seemed to promise too slow a return to a true democracy, a revolt of dissident army generals led to his replacement on November 13 by Maj. Gen. Pedro Eugenio Aramburu.

The new president met, and overcame, the almost immediate challenge of a general strike (November 15-17) and continued Argentina's return from tyranny to freedom. Notable among the many accomplishments of Presidents Lonardi and Aramburu, in addition to the defeat of Peronist leadership in the General Confederation of Labor, were the disclosure of the corruption and graft of the Perón regime, the ending of mail censorship operations at Buenos Aires, the annulment of the law punishing disrespect to government officials, the dissolution of the Peronist Party, the reopening of local courts after reorganization and the dismissal of 103 Peronist judges, the return of autonomy to the universities, and the decree (November 30) restoring *La Prensa*, symbol of a free press, to its rightful owners. (See also ANTARCTICA.)

Mesa	16,790	Yuma	9,145

¹ Unincorporated place. ² Special census, 1953.

Executive.—Chief state officers in 1955:
Governor: Ernest W. McFarland (Democrat)
Secretary of State: Wesley Bolin
Treasurer: E. T. Williams
Attorney General: Robert E. Morrison
Supt. of Public Instruction: C. L. Harkins
Constitution and Judiciary.—The present constitution went into effect in 1912. The Supreme Court comprises five justices; chief justice in 1955 was Arthur T. LaPrade.

WIDE WORLD

Argentina's provisional president, Maj. Gen. Eduardo Lonardi, reads his oath of office, Sept. 23, 1955. He was replaced on November 13 by Maj. Gen. Pedro Aramburu.

Legislature.—The legislature (Senate, 28 members; House of Representatives, 80) convenes annually on the second Monday in January.

The 1955 regular legislative session, the second longest in state history (January 10 to April 3) appropriated \$94 million for the fiscal year 1955-56. Among the 139 measures which became law were those liberalizing administrative procedures in welfare grants; making funds available for the continuation of the work of the Colorado River Boundary Commission; increasing both state and county funds for education; rendering unlawful any discrimination by public contractors against employees because of national origin; regulating the distribution, sale, or transportation of insecticides and commercial fertilizers; and appropriating funds for building programs at the University of Arizona and at state colleges. (See also below, *Principal Events*, 1955.)

Finances.—Treasury receipts (1954-55 fiscal year): \$159,935,437.60; expenditures, \$157,210,786.84; treasury balance, \$42,194,054.31. There was no long-term indebtedness.

Taxation.—General Fund revenue (1954-55 fiscal year): \$42,153,143.95, including \$12,904,781.69 from a 2% general sales tax; \$10,534,785.96 from individual and corporate income taxes; \$1,067,236.35 from licensing; and \$9,217,065.83 from property taxes. The state has no poll tax.

Banking.—As of June 30, 1955, the state's 3 national banks had \$558,134,000 in assets, \$386,323,000 in demand deposits, and \$127,275,000 in time deposits; the state's 7 other banks and 30 branches had \$216,308,093.64 in assets, \$148,046,711.57 in demand deposits, and \$53,328,704.42 in time deposits.

Education.—School attendance is compulsory for all between the ages of 8 and 16, inclusive. Operating expenditures of \$50,594,748.51 (\$290.02 per pupil) for public elementary and secondary education in the 1954-55 school year comprised \$31,331,831.18 from local school districts, \$18,124,774.86 from the state, and \$1,138,152.47 from the federal government. Construction and improvements cost \$13,333,804.34. Teachers' salaries averaged \$4,325.06.

In the 1954-55 school year there were 451 public elementary schools with 5,373 teachers and 166,041 students; 76 high schools with 1,763 teachers and 42,793 students; 11 private elementary and high schools with 112 teachers and 820 students; 2 state colleges with 275 teachers and 7,667 students; and 1 state university with 383 teachers and 6,435 students.

Social Welfare.—Public welfare expenditures from federal and state funds (excluding institutional costs) in the 1954-55 fiscal year totaled \$14,994,995, including \$9,351,776 for old-age as-

ARIZONA

sistance, \$5,090,918 for dependent children, and \$552,801 for the needy blind; a monthly average of 20,739 persons received public assistance. Expenditures totaled \$29,964.07 for health and welfare institutions and \$790,794.30 for correctional and penal institutions.

Labor Force.—The labor force (July 1955) numbered 319,200, including 49,300 agricultural workers. Nonagricultural employment was 208,600, and for the full year 1954 averaged 201,700. There were 11,900 unemployed workers in July 1954, and \$4,335,586 in unemployment compensation claims was paid to insured workers for the year ending June 30, 1954.

Manufacturing.—Establishments numbering 614 averaged 25,900 employees who received salaries and wages amounting to \$110,694,000 in 1954. Investment in new plant and equipment in 1953 totaled \$7,199,000. Earnings of production workers in manufacturing averaged \$80.93 for 41.5 hours in 1954 and averaged \$82.59 for 41.5 hours by June 1955.

In 1954, primary metal industries paid \$16,678,000 to 3,700 workers; food and food processing industries paid \$12,694,000 to 3,200 employees; lumber and wood products industries paid \$11,839,000 to 3,000 employees; and all other manufactures paid \$69,483,000 to 16,000 employees. The overall value of production in 1954 was \$300 million.

Mining.—Arizona ranks first (1954) among the states in output of copper, second in asbestos, and fourth in silver, and stood 15th in the value of its 1953 output, with 1.78% of the United States total. There were 15,907 persons employed in the state's mineral industries in 1954.

Agriculture.—Cash farm income in the first half of 1955 totaled \$150,220,000, and for the full year 1954 comprised \$92,304,000 from livestock and livestock products, \$278,181,000 from crops, and \$2,076,000 from government payments. Receipts in 1954 from livestock and livestock products included \$64,705,000 for cattle and \$15,562,000 for dairy products.

The state's 9,321 farms (41,749,946 acres; harvested cropland, 1,093,544) in 1954 averaged

4,479.1 acres and \$81,866 in value of land and buildings per farm. Livestock on farms on Jan. 1, 1955, included 945,000 cattle, 461,000 sheep, and 685,000 chickens (not including commercial broilers). During the week of Sept. 26–Oct. 2, 1954, there were 59,673 family and hired workers engaged in farming; 5,220 farms had telephones and 8,417 had electricity.

Transportation and Communications.—State and federal funds disbursed for roads and highways in the 1954–55 fiscal year totaled \$14,974,000, and newly completed construction and reconstruction aggregated 239 miles.

Highways and roads on June 30, 1954, totaled 30,416 miles (7,146 surfaced). Registered *motor vehicles* numbered 412,793 on Dec. 31, 1954, including 290,189 passenger cars. There were 6 *railroads* (1955) operating 2,182.66 line miles and (1955) 4 regularly scheduled *airlines* and (1954) 162 *airports and airfields* (43 commercial and municipal and 119 limited).

Communications media included (1955) 1 FM and 30 AM *radio stations* and 7 operating *television outlets*; (as of Sept. 30, 1954) 13 daily *newspapers* (circulation, 225,483) and 53 other newspapers; and (Jan. 1, 1955) 84,797 business and 150,887 residential *telephones*.

Principal Events, 1955.—In the first six months of 1955 aridity was so great that Arizona was designated a drought-disaster area by President Eisenhower on April 26. In June a record was set for cloudless skies and high temperatures, but July brought heavy rains and August produced record state precipitation, so that by fall the ranges were in excellent condition. In January the ban on cattle from Mexico was lifted, and some 40,000 head crossed the border in the first two months of the year.

At the beginning of 1955 the Ray copper mine closed its underground workings and converted wholly to open-pit operations. South of Tucson the Pima Mining Company was developing an open pit to enter production in 1957. In May the U.S. Congress enacted a bill granting the Papago Tribal Organization rights to minerals underlying their extensive reservation.

Industrial expansion continued during 1955. South of Phoenix the Thunderbird Chemical Company was erecting a \$13 million plant, and in Tucson the Hughes Aircraft Company expected to have 5,500 workers by the end of the year.

In addition to the regular session of the state legislature (see above, *Legislature*), two special sessions were held late in the year to consider adoption of the first new compilation since 1928 of the Arizona Legal Code. Ernest W. McFarland, former U.S. Democratic senator, was inaugurated as the state's tenth governor on January 3.

In November 1955, Arizona was host to a World Symposium on Solar Energy which was attended by 700 scientists from all over the world, and which displayed the greatest aggregation of solar machines ever collected. A laboratory for the study of solar energy was planned for the Tucson area under the sponsorship of the University of Arizona.

The proposed Shrine of the Ages Chapel at the Grand Canyon came closer to reality in 1955, with \$360,000 raised toward its construction by late in the year. (See also NATIONAL PARKS.)

Professor of Business Administration, University of Arizona.

ARKANSAS. South Central state, United States; admitted to the Union, June 15, 1836. The "Wonder State" ranks 26th in area and 31st in population (1955) among the 48 states.

Area and Population.—Area: 53,104 square miles (land 52,675; inland water, 429), divided into 75 counties. Population: (1950 census) 1,909,511; (est., July 1, 1955) 1,770,000. Urban places with populations above 10,000 in 1950, unless otherwise indicated, are as follows:

Blytheville.....	16,234	Jonesboro.....	16,310
Camden.....	16,622 ¹	Little Rock (capital).....	102,213
El Dorado.....	24,477 ²	North Little Rock.....	49,588 ²

Fort Smith.....	56,312 ¹	Texarkana.....	15,875
Helena.....	11,236	West Memphis.....	12,146 ³
Hot Springs.....	29,307		

¹ Special census, 1955. ² Special census, 1954. ³ Special census, 1953.

Executive.—Chief state officers in 1955:

Governor: Orval E. Faubus (Democrat)

Lieutenant Governor: Nathan Gordon

Secretary of State: C. G. Hall

Treasurer: J. Vance Clayton

Attorney General: Tom J. Gentry

Commissioner of Education: A. W. Ford

Constitution and Judiciary.—The present constitution went into effect in 1874. The Supreme Court comprises seven justices; chief justice in 1955 was Lee Seamster, who succeeded Justice Griffin Smith, who died on April 29, 1955.

Legislature.—The General Assembly (Senate, 35 members; House of Representatives, 100) meets in odd-numbered years commencing the second Monday in January.

The 1955 session of the legislature (January 10–March 10) appropriated \$420,616,683.58 for the 1955–57 fiscal biennium and enacted 429 measures. Among these were enactments which created the Arkansas Children's Colony for the training and education of the mentally retarded; abolished the Department of Finance and Administration and transferred its functions to the newly established offices of State Comptroller, State Purchasing Department, and Board of Finance; redefined the status of the four industrial schools for delinquents (two each for boys and girls) as educational rather than penal institutions in order to extend their eligibility for federal benefits; repealed a 1953 enactment requiring financially able persons to contribute to the support of needy relatives; and required a complete reappraisal of property at 20% of value by 1957.

Proposed for approval by the voters in 1956 were amendments which place a limit of 30 mills on the millage which may be voted by school districts, and authorize cities to levy five additional mills to the existing five-mill property tax limit.

Finances.—Treasury receipts (1954–55 fiscal year): \$159,031,393.48; expenditures, \$162,178,110.54; treasury balance, \$76,359,478.08; long-term indebtedness, \$105,066,000.

Taxation.—State tax revenue (1954–55 fiscal year): \$102,774,312.14, including \$30,287,286.56 from a 2% general sales tax and selective sales and gross receipts taxes; \$4,641,079.48 from individual income taxes; and \$7,468,741.42 from corporate income taxes. The state has a \$1 poll tax but no property tax.

Banking.—As of June 30, 1955, the state's 54 national banks had \$539,399,000 in assets, \$404,167,000 in demand deposits, and \$89,425,000 in time deposits; the state's 179 other banks had \$473,034,437.27 in assets, \$356,625,469.03 in demand deposits, and \$73,433,656.39 in time deposits.

Education.—School attendance is compulsory for all between the ages of 7 and 15, inclusive. In the 1952–54 biennium, operating expenditures

of \$45,839,222 (\$129 per pupil) for public elementary and secondary education comprised \$21,104,378 from local school districts, \$23,350,500 from the state, and \$1,384,344 from the federal government. Building fund expenditures totaled \$16,453,344. Salaries of all teachers averaged \$2,234 (high school teachers, \$2,495; elementary school teachers, \$2,048).

ARKANSAS SCHOOL STATISTICS, 1953–54

Department or school	No.	Teachers	Students
Public elementary departments (1–6 or 1–8).....	1,424	7,781	267,644

State teachers and state agricultural colleges.....	6	489	10,751
Private colleges.....	9	...	4,667
State universities.....	1	426	5,612

Social Welfare.—Public welfare expenditures from federal and state funds (excluding institutional costs) for the fiscal year 1954–55 totaled \$29,831,409.46, including \$21,369,362 for old-age assistance, \$5,119,310 for dependent children, and \$939,587 for the needy blind; a monthly average of 69,537 persons received public assistance. Operating expenditures amounted to \$7,574,033.19 for health and welfare institutions and to \$1,000,952.93 for correctional and penal institutions.

Labor Force.—On July 15, 1955, the labor force numbered 655,300, including 229,500 agricultural workers. Nonagricultural employment was 312,800, and for the full year ending December 1954 averaged 307,900. There were 32,600 unemployed workers in July 1955, including 29,700 nonagricultural workers and 2,900 agricultural workers. Unemployment insurance claims of \$9,201,017 were paid to insured workers during 1954.

Manufacturing.—Establishments in the first quarter of 1955 numbering 2,742 had a quarterly

mean average of 81,514 employees. Investment in new plant and equipment in 1954 totaled \$21,107,000. Earnings of production workers in manufacturing averaged \$51 for an average work week of 40.8 hours in 1954 and \$53.12 for 41.5 hours in the first six months of 1955.

Mining.—The value of mineral production in Arkansas reached an all-time high in 1954. Arkansas ranked first among the states in 1953 in production of barite, bauxite, and sharpening stones, and stood 24th in the value of its mineral products, with 0.88% of the United States total.

ARKANSAS MINERAL PRODUCTION, 1954¹

(In short tons, except as noted)

Agriculture.—Cash farm income in the first half of 1955 totaled \$174,549,000, and for the full year 1954 comprised \$181,104,000 from livestock and livestock products, \$378,348,000 from crops, and \$5,421,000 from government payments.

Receipts from livestock and livestock products in 1954 included: cattle (\$5,947,000), broilers (\$48,371,000), dairy products (\$34,575,000), eggs (\$16,839,000), and hogs (\$15,354,000).

The state's 145,075 farms (17,944,359 acres; harvested cropland, 5,535,607) in 1954 had an average of 123.7 acres and \$8,491 in value of land and buildings per farm. Livestock on farms (Jan. 1, 1955) included 1,485,000 cattle, 426,000 hogs, and 7,271,000 chickens (not including commercial broilers). During the week of Oct. 24-30, 1954, there were 363,202 family and hired workers engaged in farming. There were 24,360 farms with telephones; 131,668 with electricity.

Transportation and Communications.—State and federal funds disbursed for roads in the 1954-55 fiscal year totaled \$36,556,734.05, and newly completed construction aggregated 591.81 miles.

Highways and roads on Jan. 1, 1955, totaled 72,589.59 miles (7,330.88 surfaced). Registered motor vehicles numbered 537,443 in December 1954, including 364,596 passenger cars. There were 33 railroads (1955) operating 3,650.14 track miles and 1,589.79 line miles, and 4 regularly scheduled airlines and 143 airports and airfields (64 commercial and municipal, 3 military, 37 private, and 39 other fields).

Communications media included (1955) 54 AM and 2 FM radio stations and 3 operating television outlets (2 VHF and 1 UHF); 34 daily newspapers (circulation, 365,882) and 138 other newspapers (circulation, 211,683); and (Jan. 1, 1955) 92,324 business and 205,696 residential telephones.

Principal Events, 1955.—Following three years of devastating drought conditions in this predominantly agricultural state, the General Assembly took major steps to promote diversification in the economy. An Industrial Development Commission, with Winthrop Rockefeller as chairman, was created to make an all-out effort to attract industry into Arkansas. A Committee of One Hundred leading citizens was also appointed, with each member pledging at least one week per year of his time to promote the industrialization of the state. In addition, an Industrial Research and Extension Center of the University of Arkansas was created to conduct research and offer professional services to the commission. Before the end of 1955, this all-out effort was showing definite results in obtaining industry.

Most Arkansans welcomed the attitude of the U.S. Supreme Court in recognizing that each local school district should be permitted to work out its own plan for ending segregation in the public schools (see EDUCATION). Accepting the futility of attempting to evade the court opinion, the General Assembly permitted a bill designed to continue segregation to die on the Senate calendar after it had passed the House. Following the 1954 example of the Fayetteville School District, the Hoxie School District, the first to do so in heavily Negro-populated eastern Arkansas, ended segregation with the start of the 1955 fall school term, in spite of a storm of protests among certain anti-integration forces. The Little Rock School District announced that 1957 would be the earliest date in which its gradual integration would commence.

Efforts of a dog-racing track to obtain a license to operate at West Memphis resulted in months of political turmoil which ultimately involved Gov. Orval E. Faubus, the Crittenden County Chancery Court, and the State Racing Commission. Late in 1955, proponents of the track threatened court action to obtain a license to operate the \$1,500,000 dog-racing plant which they had constructed. The bitter fight brought about threats of outlawing all legal racing in Arkansas by constitutional amendment.

Little Rock's Mayor Pratt Rummel, first Republican to hold this office in modern times, was defeated in his third-term bid on November 8 by Democrat Woodrow Wilson Mann.

Legislature and Principal Events by:

MARCUS HALBROOK,

Director, Arkansas Legislative Council.

ARMED FORCES. See AIR FORCE, U.S.; ARMY OF THE U.S.; MARINE CORPS, U.S.; NATIONAL GUARD; NAVAL AFFAIRS; and the Index entry, *Armed Forces*.

ARMY OF THE UNITED STATES. U.S. Army activities in 1955 were determined primarily by the National Security Council's considered belief that a future major war would in all likelihood be air-atomic in character and of short duration. Nevertheless, the army continued to prepare for peripheral conflicts, for nonatomic war, and for a possibly prolonged aftermath to an atomic phase. In accord with the "new look" policy enunciated in 1954, and the short-war concept, army strength and funds for 1955 were materially reduced. Chief developments of the year were: testing new organizations and methods for

the tactical use of atomic weapons and the placement in service of newly developed weapons; and major changes in the military Reserve program.

Organization and Administration.—The most important civilian personnel change made in 1955 was the appointment of Wilber M. Brucker (q.v.) on June 22 to succeed Robert T. Stevens as secretary of the army. Other civilians named to top positions included Charles C. Finucane, confirmed as undersecretary of the army on February 8, and Chester R. Davis, appointed assistant secretary for financial management on February 18. Major changes in military personnel included the appointment of Gen. Maxwell D. Taylor (q.v.) on May 13 to succeed Gen. Matthew B. Ridgway as chief of staff; Gen. Lyman L. Lemnitzer on May 13 as commander of United Nations and United States forces in the Far East; Lieut. Gen. Williston B. Palmer on April 27 as vice chief of staff; Lieut. Gen. Carter B. Magruder on April 27 as deputy chief of staff for logistics; and in a split of the functions of the deputy chief of staff for plans and research (which may presage further changes in the staff structure), Lieut. Gen. James P. Gavin was appointed chief of army research and development on September 26, and Lieut. Gen. Clyde D. Eddleman became deputy chief of staff for plans on October 12.

A long-range plan providing for the deployment of army units to permanent installations was approved in June. In pursuance thereof a program for closing some installations, building permanent facilities at others, and rehabilitating some 1,400 World War II-type barracks, mess halls, and bachelor-officers' quarters was inaugurated.

On the administrative side, decentralization and the use of more modern accounting and business practices continued. Furthermore the army also eliminated some 110,000 items of supply and reduced the total to about 1 million by the end of the year.

Personnel.—U.S. Army strength was reduced from 1,405,000 (128,200 officers) on June 30, 1954, to 1,109,000 (121,900 officers) on June 30, 1955, and is expected to be reduced further to 1,027,000 (estimated) by June 30, 1956. General M. B. Ridgway spoke out most vigorously against this trend. Late in 1955 the army was asking for an increase of 16,000 men to conduct the training necessary under the new Reserve program (see below).

In 1955, important steps were taken to make an army career more attractive. Provisions were made for better housing, distinctive insignia for noncommissioned officers as differentiated from technical specialists, assistance in off-duty schooling, and improved allowances for change of station and re-enlistment. Pay increases ranging from 6 to 25% became effective on April 1. Standards for enlistment were raised, and some 17,000 men in the lowest mental categories were separated as a step in strength reduction. After these changes, career enlisted men comprised almost 60% of the total, and immediate re-enlistments increased from an average of 4,700 in fiscal year 1954 to 6,000 in the first half of 1955.

During the year, civilian employees were reduced by 33,000 to a total of 462,000 (including 80,000 employed overseas). There were also 215,000 foreign nationals working for the army. Operation Team Mate, under which 12,500 military personnel in noncombat positions are to be replaced by civilians, was about three fourths completed by 1955.

Operations and Training.—In mid-1955, 9 divisions were stationed in the United States, five in Europe, three in the Far East, and one each in Hawaii, Alaska, and the Caribbean area.

Operation Gyroscope, a system providing for the rotation of complete units rather than individuals, was begun on a large scale in July 1955 when the 1st Infantry Division in Europe changed posts with the 10th Division in Fort Riley, Kansas.

More than 90,000 troops participated in field training in the fiscal year 1955. New concepts of divisional combat in atomic warfare were tested in several operations held during the year. Logistic techniques, including parachute drops in extremely cold weather, and defense against atomic attack and army aircraft operations in cold and mountainous areas were also extensively tested.

Army service schools produced 190,000 graduates in 1955. In addition, 5,800 army personnel completed courses at air force schools, 1,100 at navy schools, 3,700 at joint schools, and 1,600 at civilian institutions.

The deployment of Nike (surface-to-air missile) and Skysweeper (antiaircraft gun) air defense, begun in 1954, was greatly expanded in 1955. It was believed that by mid-1956 all Nike sites would be prepared, and that 85% of the total units planned would be operational.

Besides normal military operations, the army continued to support the armed forces of other countries. In the fiscal year 1955 it delivered \$1.15 billion in equipment to Mutual Defense Assistance Program (MDAP) countries, over 50% of it to Europe. Of the total, \$490 million was in offshore (non-United States) procurements, a sum which continued to provide the strategically important benefit of expanding the free world military production base. In addition, 4,200 training courses were completed by students from MDAP countries in U.S. Army schools, and mobile training teams abroad were increased from 36 to 78.

New authorizations for civil works programs in the fiscal year 1955 covered 165 projects in 40 states and overseas possessions, to cost \$600 million. Flood control and attendant disaster relief activities were augmented by the unusual number of floods and destructive hurricanes.

Research and Development.—To render the army research and development program more efficient and productive, responsibility for it was concentrated in one staff by 1956.

Advances were achieved in a variety of fields. In the field of fire power, the 280-mm. gun, the

Secretary of the Army Robert T. Stevens (at right), who resigned June 22, 1955, congratulates Gen. Maxwell D. Taylor on the latter's appointment as chief of staff (May 13), succeeding Gen. Matthew B. Ridgway (center).

UNITED PRESS

U.S. ARMY

Army missiles shown above are (left to right): Honest John rocket, capable of carrying conventional or nuclear warheads; and the high-speed Nike and Corporal, both long-range guided missiles.

Honest John rocket, and the Corporal guided missile were improved, and progress was being made on a whole new family of artillery guns and howitzers. The serious problem of air-transportability was being met by the development of aircraft capable of handling larger and heavier loads and by the development of lighter and smaller equipment. Increased land mobility was being sought through such means as diesel-electric trackless trains and better flotation for tracked and wheeled vehicles. Development in other fields included better protective clothing, gas masks, and radio communications; a multilingual typewriter; and a vehicle called the mechanical mule.

The U.S. Army is also participating in Operation Vanguard, the space satellite project, for the International Geophysical Year, 1957-58.

Matériel.—In 1955 army use of guided missile and rocket equipment was materially increased; the project of replacing the 105-mm. and 75-mm. rifles by the 106-mm. recoilless rifle was begun; and a gigantic amphibious, low-ground pressure vehicle (the BARC) and aerial tramways were introduced.

In the area of aircraft, fixed-winged transports carrying over one ton were sanctioned for army use, and three helicopter companies were added during the year. In October the army arranged for the use of air force jet trainers.

Reserve Components.—The Reserve Forces Act, passed by Congress on July 26 and signed by President Eisenhower on Aug. 9, 1955, raised the Ready Reserve ceiling from 1,500,000 to 2,900,000 and authorized the president to call 1,000,000 men into training in a national emergency. It established various ways, all voluntary, by which men may enter the Reserves as an alternative to being called up for 2-years' active service under the Selective Service Act, and fixes the obligation for service under each plan. The one

under which 17-to-18½-year-old volunteers can enlist for six months of active duty and seven and one-half years of Reserve duty attracted most attention.

Although the extension by Congress of the Selective Service Act (June 16) for four years provided somewhat of an incentive to undertake Reserve duty, the initial response was disappointing. By the end of 1955, some 7,000 men, including 5,000 in the six-month plan, had volunteered. Training plans had been based on a maximum of 5,000 per month. The army instituted a vigorous recruiting campaign when the situation became apparent. Although President Eisenhower signed the act, he pointed out its defects, one of which, he said, was the denial of draft authority to implement the program. He directed the defense establishment to prepare remedial legislation. The need for legislation was emphasized by the fact that when the Reserve Forces Act was passed, only about 162,000 Army Reserve personnel were undergoing sufficient training to keep them on pay status. (See also NATIONAL GUARD; SELECTIVE SERVICE.)

In consonance with the concept that primary effort should be spent on forces that can be mobilized within 6 rather than 18 months, the U.S. Army initiated a program to convert 12 of the 25 USAR divisions into training units and to eliminate some 358 smaller units in favor of types needed in the early stages of war. In October opponents of the program alleged that it was discriminatory and militated against the operation of the new Reserve Forces Act.

Budget and Expenditures.—For the fiscal year 1956, Congress provided (June 30, 1955) new obligatory authority of \$7,329,953,000. Balances brought forward of \$4.3 billion and an anticipated \$1.2 billion return from Mutual Defense Assistance and other services gave the army nearly \$13 billion. However, it is estimated that only about \$9.5 billion will be obligated before July 1957.

Improved purchase planning has resulted in a decrease in unliquidated obligations from \$8.1 billion in 1954 to \$5.8 billion in 1955. Unobligated funds were reduced in the same period from \$7.7 billion to \$4.4 billion. Actual expenditures were \$8.9 billion for the fiscal year 1955, compared with \$12.9 billion for 1954. Each was \$1.3 billion below the original estimate. (See also NATIONAL SECURITY.)

ARTHRITIS. Reports continue to appear indicating that arthritis and related diseases are among the most prevalent of the chronic diseases throughout the world, causing serious economic loss, and making a major contribution to prolonged disability and to human suffering. From a sampling survey carried out in 42 states, it was estimated that there were about 10,100,000 persons of the age of 14 years or over in the United States with arthritis and rheumatism. This amounts to 9.3 per cent of this portion of the population. About one quarter of these 10,100,000 are estimated to have made some significant change in the type or amount of work they performed, or in their usual activities, because of their rheumatic difficulties.

The economic impact of rheumatic diseases is

further emphasized by statements that they cause nearly one sixth of the total industrial invalidism in England and Wales with an annual work loss of 3 million man-weeks. In the United States, arthritis and rheumatism cause more years of disability than do all types of accidents. It has been estimated that the total annual loss from this cause in the United States is nearly 100 million man-days, with an approximate cost of \$100 million per year for medical care alone.

In the face of a problem of this magnitude, the mobilization of resources for a nationwide attack in many countries has continued. In the United States the lead has been taken by the Arthritis and Rheumatism Foundation, the American Rheumatism Association, and the National Institutes of Arthritis and Metabolic Diseases (a division of the U.S. Public Health Service).

Rheumatoid Arthritis.—Research on this disease, the type of arthritis most likely to produce permanent joint damage and crippling, continues to emphasize its constitutional or systemic nature. Evidence continued to accumulate that the inflammatory changes in the connective tissue in this disease are by no means restricted to the connective tissue of the joints. Concurrently, treatment continues to emphasize the importance of a well-rounded program adapted to the needs of each individual patient, rather than reliance on any single medicine or drug. The importance of rest, the use of various medicines to relieve pain, the use of heat and exercise to prevent deformity, the value of orthopedic measures in the prevention or correction of deformity, and the importance of attention to all factors bearing on the patient's general health are all being stressed.

Further work served to more sharply define the usefulness and limitations of cortisone and hydrocortisone in rheumatoid arthritis. An important development was the introduction of prednisone (Meticorten), a synthetic steroid closely related in chemical structure and pharmacologic effects to cortisone and hydrocortisone. This material was found to temporarily suppress the manifestations of rheumatoid arthritis in smaller doses than were required of the other steroids, and to be free of some, but by no means all, of the undesirable effects of cortisone and hydrocortisone. Like the other steroids, prednisone was found to be essentially a suppressive agent rather than a curative agent, and its use requires careful medical supervision and individualization of dosage to the needs of each patient.

Injections of hydrocortisone acetate directly into involved joints have been found to be worthwhile in about half of carefully selected patients with rheumatoid arthritis. As was true of the systemic use of the adrenal steroids, the best results were obtained when this method of treatment was combined with other methods of therapy.

Further experience with phenylbutazone (BUTAZOLIDIN) emphasized the toxic potentialities of this drug, and served to underline the recommendation that it should never be taken without careful medical supervision.

Rheumatic Fever.—Further studies have supported the close association of streptococcus infections with acute rheumatic fever, but fail to solve the mystery of the exact manner in which the streptococcus produces this disease. It was clearly shown that the great majority of attacks of acute rheumatic fever can be prevented by prompt and effective treatment of streptococcus infections with penicillin, and that recurrent attacks could be largely prevented by the regular

use of sulfanilamides or penicillin. The use of cortisone and related steroids in the treatment of acute rheumatic fever was more firmly established, although as yet there are no results indicating a uniform and clear-cut superiority of the results of treatment with these steroids over those obtained with salicylates. Some studies suggested that the use of cortisone or ACTH early in the attacks of acute rheumatic fever, in sufficient dosage and for a sufficient period of time, did reduce the incidence of chronic residual heart damage. The necessity of bed rest until all evidence of rheumatic activity had subsided remains of paramount importance regardless of the medication used in treatment. (See also HEART DISEASE; PEDIATRICS.)

Osteoarthritis.—Treatment of this condition continues to emphasize methods for relief of pain and for maintenance of function. Limitation of weight bearing, the use of heat and exercises, and of medications to relieve pain, combined with restriction of use of the joints, constitute the most effective measures. Direct injection of hydrocortisone acetate into the afflicted joints has been found to be of benefit in carefully selected patients. In severe osteoarthritis of the hip, surgical procedures are often required to obtain relief.

Gout and Gouty Arthritis.—This is the only type of arthritis which has been shown clearly to be related to an abnormality in body chemistry. Improved methods of treatment now make it possible to control nearly all the manifestations of this disease in a great majority of patients. The use of colchicine continues to be the most practical remedy for acute attacks, although the way in which it acts remains completely unknown. The use of phenylbutazone to terminate acute attacks has been placed on a sounder basis as the result of studies of the blood level of this medication after it is administered.

The frequency of acute attacks can usually be reduced by careful attention to known precipitating factors, by the regular daily use of colchicine in prophylactic dosage, and by appropriate dietary measures. The effectiveness of probenecid (Benemid) in promoting the excretion of excessive uric acid through the kidneys will often reduce the serum uric to normal. The use of this drug has opened up the possibility of preventing some of the late complications of gout. In some studies it also has appeared to be effective in decreasing the incidence of acute attacks.

ASIAN-AFRICAN CONFERENCE (BANDUNG CONFERENCE, 1955). From April 18 through April 24, 1955, twenty-nine nations of Asia and Africa, representing over half the population of the world, met in Bandung, Indonesia, to discuss a variety of common problems arising out of the tensions of the modern world. The historic conference—the first of its kind ever held—seemed

WIDE WORLD

a symbol of the resurgence of the Asian and African people, and reflected their growing spirit of independence and desire to participate actively in the affairs of the world.

Participating in the meetings were the so-called Colombo Plan nations (Burma, Ceylon, India, Indonesia, and Pakistan, sponsors of the conference), Afghanistan, Anglo-Egyptian Sudan, Cambodia, the Chinese Peoples' Republic, Egypt, Ethiopia, Gold Coast, Iran, Iraq, Japan, Jordan, Laos, Lebanon, Liberia, Libya, Nepal, the Philippines, Saudi Arabia, Syria, Thailand, Turkey, North Viet-Nam, South Viet-Nam, and Yemen.

In accordance with the plans adopted by the Colombo nations at Bagor, Indonesia, in December 1954, when the conference was conceived, it was agreed at the preliminary session (April 17) that the talks would be limited to broad international questions. An agenda covering five general topics was finally agreed upon: (1) economic cooperation; (2) cultural cooperation; (3) human rights and self-determination; (4) world peace and cooperation; and (5) problems of dependent peoples. The chief delegates elected Dr. Ali Sastroamidjojo, premier of Indonesia, as conference president.

In his speech of welcome, President Sukarno of Indonesia struck the keynote of the conference, declaring that the "voiceless ones of the world" were determined to speak out in behalf of Asian-African independence and world peace.

REPUBLIC OF INDONESIA INFORMATION OFFICE

As early as the first day, however, the unity desired by the sponsoring nations was disrupted over the question of colonialism. In a blistering attack on communism, Dr. Fadhil al-Jamali, minister of state for Iraq, declared that it was "a new form of colonialism much deadlier than the old." This anti-Communist point of view was echoed by Carlos P. Romulo, chief delegate of the Philippines, who warned the Asian-African nations against rejecting the old colonialism only to accept a new type, the principal tenet of which is "the pervasive control of human life in all spheres by a tightly run self-selected organization of elite individuals." A similar theme was expressed by Prince Wan Waithayakon, foreign minister of Thailand, Dr. Djalal Abdoh, acting delegate for Iran, and Mohammad Ali, prime minister of Pakistan.

On the second day (April 19), Chou En-lai, premier of Communist China, setting the mild-mannered tone of his future statements, said that his delegation had come to the conference "to seek unity and not to quarrel," and reiterated as a means of securing peace in the world the "five principles of coexistence" that form the basis of Indian-Chinese relations.*

The split between the anti-Communist nations and the neutralists, headed by Jawaharlal Nehru, prime minister of India, was crystallized when, on April 21, in answer to Chou, Sir John Kotelawala, prime minister of Ceylon, laid bare the reality of Communist subversion in Asia and Africa and urged the conference to denounce Communist colonialism, along with the old type associated with the West. He also proposed a plan for the settlement of the Formosa question which called for a five-year trusteeship of the island by the United Nations or the Colombo nations, to be followed by a plebiscite which would determine Formosa's final form of government. Subsequently the anti-Communist block—Turkey, Pakistan, Iraq, Iran, Liberia, Libya, Lebanon, Anglo-Egyptian Sudan, and the Philippines—pressed for a resolution condemning all forms of colonialism, including "international doctrines resorting to methods of force, infiltration, and subversion."

Fearful lest the Asian-African nations lose their growing prestige by creating the impression for the outside world that the conference had degenerated into one for choosing sides in the cold war, Nehru made a fervent plea for unity and a defense of his neutralist principles. Admitting the injustices of Chinese foreign policy and methods, and condemning the North Atlantic Treaty Organization (NATO) as "a powerful protector of colonialism," he insisted that joining either bloc meant not only the loss of honor but also the loss of national identity. When Burmese Premier U Nu's compromise proposal, providing for the inclusion of the human rights guarantee of the United Nations Charter, along with the "five principles of coexistence," in a declaration, was rejected by the anti-Communist countries, the conference came to a deadlock.

In the meantime, Chou En-lai had been working in private to promote goodwill between Communist China and as many of the Asian-African countries as could be influenced. The climax of the conference—and of Chou's deft diplomacy—came on April 23, when, along with a 7-point peace program in which he offered ma-

* Respect for each other's territorial integrity and sovereignty, nonaggression, noninterference in each other's internal affairs, equality and mutual benefit, and peaceful coexistence.

terial assurances to Burma, Thailand, the Philippines, Cambodia, Laos, and Japan, he declared that "China and the United States should sit down and enter into negotiations to settle the question of relaxing the tension in the Taiwan (Formosa) area."

On April 24 the conference issued its final communiqué incorporating unanimously adopted recommendations on the 5-point agenda, together with declarations on dependent peoples and world peace. A summary of the principal items in the communiqué follows.

Economic Cooperation.—The conferees "recognized the urgency of promoting economic development in the Asian-African region," including the investment of foreign capital; agreed "to provide technical assistance to one another"; recommended the "early establishment of a special United Nations fund" and "an international finance corporation" for economic development; recommended means of "stabilizing commodity trade in the region"; and recommended "the development of nuclear energy for peaceful purposes" and "the establishment of an international agency which would provide for adequate representation of the Asian-African countries."

Cultural Cooperation.—The conference "condemned racialism as a means of cultural suppression," and the denial of fundamental rights in the sphere of education and culture in Tunisia, Algeria, Morocco, and other parts of Africa; and recommended the development of cultural contacts with nations outside the Asia-Africa area, and "bilateral arrangements" and individual action to implement cultural cooperation.

Human Rights and Self-Determination.—The conference "declared its full support of the fundamental principles of human rights as set forth in the Charter of the United Nations"; declared support of "the principle of self-determination of peoples and nations"; "deplored the policies and practices of racial segregation and discrimination . . . in large regions of Africa and in other parts of the world"; and declared its support of "the rights of the Arab people of Palestine" and called for "the implementation of the United Nations resolution on Palestine."

Problems of Dependent Peoples.—The conference supported the claim of Indonesia in the

case of West Irian and urged the Netherlands government to reopen negotiations to fulfill its obligations; and supported the "rights of the people of Algeria, Morocco, and Tunisia to self-determination and independence, and urged the French government to bring about a peaceful settlement without delay."

Promotion of World Peace and Cooperation.—The conferees agreed that "membership in the United Nations should be universal" and called on the Security Council to support the admission of nations that qualified for membership (Cambodia, Ceylon, Japan, Jordan, Laos, Libya, Nepal, and unified Viet-Nam); advocated a more equitable representation on the Security Council for Asian-African countries; and called for disarmament and "prohibition of production, experimentation, and use of nuclear and thermonuclear weapons of war," and effective international control to implement such prohibition.

Declaration of Problems of Dependent Peoples.—The conference declared that "colonialism in all its manifestations is an evil which should be speedily brought to an end," and declared its support of the causes of freedom and independence for those peoples who are subjected to alien subjugation.

Declaration of Promotion of World Peace and Cooperation.—The conference advocated a peace program based on the following principles: (1) "respect for the fundamental human rights and for the purposes and principles of the Charter of the United Nations"; (2) "respect for the sovereignty and the territorial integrity of all nations"; (3) recognition of the equality of all races and nations; (4) "abstention from intervention or interference in the internal affairs of another country"; (5) "respect for the rights of each nation to defend itself singly or collectively in conformity with the United Nations Charter"; (6) "abstention from the use of arrangements of collective defense to serve the particular interests of any of the big powers," and "abstention by any country from exerting pressures on other countries"; (7) "refraining from acts or threats of aggression . . . against the territorial integrity or political independence of any country"; (8) "settlement of all international disputes by peaceful means. . ."; (9) "promotion of mutual interest

ASPHALT. Most of the world's supply of natural asphalt is produced on the island of Trinidad, but the United States produces large quantities of other asphaltic materials, as indicated by the following sales figures for 1954 (in short tons, with corresponding figures for 1953 shown in parentheses): petroleum asphalt, 14,680,982 tons (14,041,648); bituminous rock, 1,332,000 tons (1,440,000); gilsonite, 76,000 tons (61,000); road oil, 1,346,300 tons (1,330,344). Bituminous rock and gilsonite are natural products; the others are byproducts of petroleum refining. All of the road oil and 68% of the petroleum asphalt sold was used in road paving, and 22% of the petroleum asphalt was employed in roofing products. United States imports of petroleum asphalts reached 607,000 short tons in 1954 (451,000 in 1953). Exports totaled 291,000 tons (277,000 in 1953).

ASSOCIATIONS. See SOCIETIES AND ORGANIZATIONS.

ASTRONOMY. Astronomical progress in 1955 was characterized by much international cooperation and application of new techniques, rather than by spectacular discoveries. The employment of radio telescopes and electronic equipment in observation, and of the new types of computing machines in theoretical astronomy, are especially noteworthy.

Eclipses.—There were three eclipses in 1955, two solar and one lunar, none of which was visible in the United States. That of June 20 was a total eclipse of the Sun, notable for the long duration of totality, namely 7 minutes 7.8 seconds.* The path crossed Ceylon, Indochina, and the Philippines. Ceylon was chosen by nearly all of the many excellently equipped expeditions as having the best chances for clear skies; but clouds ruined the plans of these expeditions, and

* One scientist, Frank Bach, observed the eclipse from a T-33 jet trainer of the U.S. Air Force. By flying along the path at a speed of about 600 mph., he was able to observe totality for 11 minutes, an all-time record.

at no place could the astronomical program be carried out successfully. In the Philippines, however, several observers secured excellent photographs of the corona.

The corona was of the typical sunspot minimum type, with two great equatorial wings, both projecting fully a solar diameter from the Sun's limb. Two bright prominences were visible, and at both poles the usual short, narrow streamers were observed.

On November 29 there was a partial lunar eclipse, and on December 14, an annular solar eclipse, both of little scientific value. The latter's path began in Africa, but a large part of it was over the Indian Ocean.

Mars.—Because the years 1954 and 1956 were due to have favorable oppositions of Mars, extensive plans for observing them were made in advance. Some of the results of the 1954 observations have now become available. Seven observatories, favorably situated as to longitude, were chosen as primary stations, while at least ten others cooperated extensively in the observations. Since the most powerful telescopes were used, much information was gained; and because the 1956 opposition will be far better for scientific observation, due to a closer approach of the planet, experience gained in 1954 will be helpful at that time.

Photographic plates and techniques have become so improved that negatives taken of the planet in 1954 show surprising detail. By using red and yellow color screens, surface features are made to show up in plates; and by using a blue screen, atmospheric phenomena can be studied. The most important discovery seems to be that great changes have occurred on the surface of the planet. Typical are the results obtained by E. C. Slipher, who took photographs at Lowell Observatory in 1907 and at the Lamont-Hussey Observatory in South Africa in 1939 and 1954. Syrtis Major is one of the most readily detected features on the planet. The area to its left was practically without detail in 1907; by 1939 a dusky curved band had become conspicuous; and by 1954 a very large dark region had developed, said to be the greatest change noted on the planet since fairly good maps were first made over a century ago. (See also NATIONAL GEOGRAPHIC SOCIETY.)

As for atmospheric changes, the troublesome blue haze, so often present, almost disappeared during May and June 1954, but had returned by July 2. Cloud belts, roughly parallel to the Martian equator, showed up in a blue-light exposure on July 18. Very remarkable also was a W-shaped cloud photographed at Mount Wilson Observatory on June 2 and 3, 1954, on the sunset limb of the planet. On July 3, when the same region was again on the sunset limb, the cloud was still there. It probably reformed every afternoon, since it could hardly have lasted a month. Work at the Mount Palomar Observatory by W. M. Sinton and John Strong showed that, on the equator, the maximum temperature (+77°F.) came 15 to 30 minutes after local noon. The sunrise temperature at the same place was -58°F.

"Radio Noise" from Jupiter.—At Seneca, Md., the Carnegie Institution has erected a radio antenna of the "Mills cross" type. In a survey made at declination +22° early in 1955, for 9 out of 30 transits, very intense outbursts of "radio noise" occurred 6 minutes after Jupiter crossed the beam. If this noise is radio static caused by electrical discharges in Jupiter's atmosphere, such discharges would have to be on a vastly greater scale than we find on the Earth.

Comets.—The more noteworthy comets discovered in 1955 were as follows:

Periodic Comet Harrington-Abell—Discovered on March 22 in the constellation Leo, by Robert G. Harrington and George O. Abell of Mount Wilson and Palomar Observatories; of magnitude 17; period, 7.01 years; orbital inclination, $16^{\circ}6'$.

Comet Abell—Discovered on April 17 in the constellation Canes Venatici, by George O. Abell; of magnitude 15; orbital inclination, 124° ; perihelion distance, 4.5 A.U. (astronomical units).

Periodic Comet Whipple (1955d)—Rediscovered on May 25 in the constellation Pisces, by Elizabeth Roemer at Lick Observatory; of magnitude 18.

Comet Mrkos—Discovered on June 12 in the constellation Perseus, by A. Mrkos at Skalnaté Pleso Observatory, Czechoslovakia; of magnitude 5 or 6; orbital inclination, 86° ; perihelion distance, 0.54 A.U.

Comet 1955f—Discovered on July 13 in the constellation Pegasus, by A. M. Bakharev at the Stalinabad Astronomical Observatory, USSR; of magnitude 8; orbital inclination, 50° ; perihelion distance, 1.4 A.U.

Comet 1955g—Discovered on July 29 in the constellation Orion, by the Japanese astronomer Honda at Kwasan Observatory, Kyoto, Japan; of magnitude 8.

Meteors.—The Harvard Meteor Expedition in New Mexico, which has two stations, each equipped with a powerful Baker Super-Schmidt camera, has accumulated data on over 4,000 meteors simultaneously photographed at both stations. These cameras permit photographing of meteors as faint as +3 or +4 magnitude, which explains the great number secured. A graphical method of reduction gives results with mean errors of 5% in velocity and 3% in height. A special study made by Fred L. Whipple, who directs the expedition, indicates that slower meteors of zero magnitude have a mass of 0.7 gram, while very swift ones may have a mass of only 0.02 gram; average densities would be 0.31 times that of water. A study of the Alpha Capricornid meteors indicates that those seen in August 1955 have orbits similar to that of Comet 1948n. Those from this radiant, seen in July, have definitely smaller orbits, though approximating the same perihelion distances.

The first parts of *Meteor Observations in the Antarctic*, Byrd Antarctic Expedition II, 1933–1935 appeared late in 1955. It is by Thomas C. Poulter, second in command of the expedition. The number of meteors seen per hour, both with the naked eye and with binoculars, was far greater than expected. A remarkable fact was that the numbers increased as the temperature fell. Poulter explains this as probably due to the lower content of water vapor in the air, and hence its increased transparency.

Stars.—A new determination of distance from the Earth of the Magellanic Clouds has been made by Gerard de Vaucouleurs at the Commonwealth Observatory, Australia, based on absolute magnitudes of novae 14 days after maximum light. The distance has been determined as 170,000 light-years—a considerably greater figure than had been determined a decade ago. It was also shown that, contrary to former belief, the larger cloud has a spiral structure with a maximum diameter of 49,000 light-years.

At the Mount Palomar Observatory a new investigation has been made by Walter Baade, using the 200-inch telescope on the Great Nebula in Andromeda, which is a spiral. Because the area of the nebula is so large, three regions were selected for special study. A total of 275 Cepheid variables were detected, 38 in the region only $15'$ from the nucleus, and 238 in the region $50'$ distant and covering a part of the spiral arms. None was found in the third region, $96'$ distant, probably because of dust absorption. By using these Cepheids to find the distance of the nebula, it was possible to arrive at a figure of 2 million

light-years—nearly three times the figure determined a decade ago. Five faint planetary nebulae were also detected. Their apparent magnitudes provide a good check on the newly determined distance. Baade also concludes that the dust is concentrated in the spiral arms, whose evolutionary development seems to be traced outward. Recent work has, in all instances, resulted in increased figures for the distances from the Earth of other galaxies, generally two or more times what had formerly been determined.

U.S. NAVY

Naval Research Laboratory's 50-foot radio telescope.

A very interesting solution for the orbit and mass of a faint binary star, Ross 614-B, has been made by Sarah Lee Lippincott at Sproul Observatory, Swarthmore, Pa. It is based on plates taken there and at McCormick Observatory, University of Virginia. The star's period has been determined as 16.5 years, and the relative orbit has been found to have a semimajor axis of 3.9 astronomical units—smaller than Jupiter's orbit. The masses of the two components are only 0.14 and 0.08 that of the Sun, the smaller being the least massive star known and actually seen.

Emeritus Professor of Astronomy, and Former
Director of Flower and Cook Observatories,
University of Pennsylvania.

ATOMIC ENERGY. The striving for international cooperation dominated thought and effort in the field of atomic energy during 1955. It was strongly reflected at the first International Conference on the Peaceful Uses of Atomic Energy, held at Geneva, Switzerland, from August 8 to 20; in progress made by the United States in its Atoms for Peace program; and in endorsement by the United Nations of plans for an international Atoms for Peace agency.

Geneva Conference on Atomic Energy.—The International Conference on the Peaceful Uses of Atomic Energy was attended by representatives of 72 nations and 7 specialized agencies. Chairman Lewis L. Strauss of the Atomic Energy Commission headed the American delegation.

For hundreds of young American nuclear physicists this was their first opportunity to discuss their work outside their own immediate circles. Many Russian nuclear scientists and engineers also attended and, although reticent in comparison with others, they, too, discussed their work. Thousands of heretofore secret reports,

UNITED PRESS

Atomic fireball of Operation Cue explosion, May 5, 1955, spreads across floor of Nevada desert, while soldiers huddle in trench 3,500 yards from Ground Zero.

mostly from American sources, but including many from the United Kingdom and the Soviet Union, were declassified and distributed for the first time. Comparison of these reports revealed an astonishing agreement between the major laboratories of all countries on all important matters. The international agreement on the nuclear collision cross-sections as functions of energy of all the important materials was particularly striking.

The conference also permitted comparison of the stature of nuclear scientists of all countries against a common norm. Observers were unanimous in concluding that the best scientists of all nations actively working in the nuclear energy field were of equal ability. Some observers concluded that junior American nuclear scientists excelled the Russians in both number and quality, but this probably was the result of different methods of selection of participants from the two countries.

Every nation active in the field of atomic energy had material exhibits at Geneva. Those from the USSR were distinctly of less perfect mechanical execution than those from the United States, indicating a much higher reliance on hand-fitting and a more limited selection of materials of construction.

The United States exhibited the only nuclear reactor seen at the Geneva conference. This was of the "swimming pool" type, in which ordinary (as distinct from heavy) water acts simultaneously as moderator, radiation shield, and coolant. The fuel elements were sheets of alloys of aluminum and enriched nuclear fuels, and were in direct contact with the water of the pool. When the unit was in operation, the interaction of nuclear radiation with the water produced a bluish light which could be plainly seen. Tens of thousands of visitors from all nations thus saw nuclear fission in action for the first time.¹

Atoms for Peace.—In 1955 the United States made swift headway in the Atoms for Peace pro-

¹The portable components of this reactor cost \$300,000. At the conclusion of the conference it was sold to the Swiss government, along with the associated building, for \$180,000.

gram envisaged by President Dwight D. Eisenhower in his speech before the United Nations on Dec. 8, 1953, and implemented by the revision of the Atomic Energy Act in 1954. On Nov. 15, 1954, the United States had offered to contribute 220 pounds (100 kilograms) of uranium-235 to an international pool of atomic fuels if the other producing nations would make comparable contributions. Both the USSR and Great Britain agreed in principle to this proposal, and the latter offered on Nov. 16, 1954, to contribute 44 pounds of fissionable materials, but neither country made any firm commitment as to the nature of the fuels they would contribute. Meanwhile, under authority of the revised act, the United States went ahead on its own to make nuclear fuels available to other countries. This program, begun late in 1954, was accelerated markedly in 1955. By fall, at least two dozen agreements to supply uranium-235 to other nations had been signed.² These agreements provide to the respective governments unclassified information as to design, construction, and operation of research reactors. It is contemplated that private American citizens and organizations will be authorized to supply appropriate equipment and services.

The Atomic Energy Commission will lease to these governments up to 13.2 pounds (6 kilograms) of uranium-235 mixed with ordinary uranium in concentration not exceeding 20%. The receiving government is obligated to return spent fuel charges from the reactors to the United States without altering them in any way after removal from the reactor. Thus, other nuclear fuels produced as byproducts within the fuel of the reactor will revert to the United States. The contracts do not specifically provide what happens to nuclear fuels produced by capture of neutrons which escape from the fuel elements

²Agreements were signed with Argentina, Brazil, Chile, Nationalist China, Colombia, Denmark, Greece, Israel, Italy, Japan, the Republic of Korea, Lebanon, the Netherlands, Pakistan, Peru, the Philippines, Portugal, Spain, Sweden, Switzerland, Thailand, Turkey, which on May 3, 1955, signed the first agreement, Uruguay, and Venezuela.

of the reactor. All types of nuclear reactors produce these extra-core neutrons which could, theoretically at least, be absorbed in a thorium blanket external to the fuel elements, and recovered as fissionable uranium-233. Title to this material appears uncertain.

Belgium, as a principal supplier of uranium to the United States, is a principal in a special contract. In addition to the benefits of the more general contracts noted above, classified information, not including restricted data or primarily military information, is to be exchanged; and Belgium may have, if she desires, more than 13.2 pounds of uranium-235. In return, Belgium gives the United States an option to purchase up to 75% of the uranium ores and concentrates produced in the Belgian Congo through 1960.

A contract with Canada is similar to that with Belgium, except that it grants the United States an option on the nuclear materials produced by extra-core neutron irradiation from piles in which uranium-235 from the United States is used.

The contract with Great Britain, which is an active producer of nuclear fuels and which needs none from the United States, binds both parties not to transfer to other countries materials of primarily military significance.

United Nations Atoms for Peace Resolution.—By a 58 to 0 vote, with no abstentions, the U.N. General Assembly endorsed, by resolution of Dec. 3, 1955, the progress being made toward creation of an international Atoms for Peace agency. (See also UNITED NATIONS.)

U.S. Atomic Energy Commission.—Three new members were named to the AEC in late 1954 and in 1955, joining Chairman Lewis L. Strauss and Thomas E. Murray. These were Willard F. Libby, a radiation expert (confirmed by the Senate on Dec. 2, 1954); John von Neumann, a mathematician (confirmed March 14, 1955); and Harold S. Vance, a corporation executive (appointed Oct. 10, 1955).

Weapons Tests.—The AEC conducted a series of weapons tests from Feb. 18 to May 15, 1955, at the Nevada Proving Grounds, with the cooperation of military and civil authorities. Fourteen nuclear blasts were involved, bringing the total to 46 in the continental United States since the first one in 1945. With one exception, very little information was given out regarding the nature and purpose of these tests. One burst was very high, and several appear to have been quite small. Some were tower shots and some were air bursts. In one test, military personnel were exposed in tanks at relatively short distances from ground zero. The results of these tests were not made public.

The exceptional tests, held May 5, had to do with civil defense. The press and representatives of the civil defense units of all the states were invited. A modern village, complete with all facilities, was constructed on the site. Dummies simulating people were placed in the buildings.

Unfavorable weather caused repeated postponement of this test, and by the time of the actual shot most of the visitors had gone home. Apparently the device exploded had approximately the yield of the bombs exploded over Japan. House walls facing the blast were set aflame by the thermal radiation. In most cases these fires were extinguished by the following blast wave. Some houses were blown to bits by the blast wave. The dummies, as well as some live animals, protected by improvised basement shelters of the type previously recommended by

civil defense authorities were recovered in good condition, even in houses otherwise totally destroyed. In general, this test confirmed the correctness of previously advocated defensive measures. (See also FEDERAL CIVIL DEFENSE ADMINISTRATION.)

A second series of nuclear tests involving the setting off of small test devices was held in the latter half of October and in November. These were to be followed in the spring of 1956 by tests of both nuclear and thermonuclear weapons on the Eniwetok and Bikini atolls in the Pacific.

The U.S. Navy exploded a test device deep below the surface of the Pacific at a point a few hundred miles off the coast of California. No details of this test, public announcement of which was made May 17, were released.

The AEC announced on August 4 that the Russians had started a new series of nuclear tests in 1955. The implication of the announcement was that this was part of a series of tests not dissimilar from those in Nevada. On November 26 the USSR announced that it had recently exploded a thermonuclear weapon "at a great height." Communist Party Secretary Khrushchev said that the blast was equal to one megaton (1-million tons of TNT), which would make it much less powerful than the thermonuclear device exploded by the United States in 1952. American officials believed that the blast was equal to at least two to four megatons.

Although the British were reported to be nearly ready to test a thermonuclear device, no nations other than the United States and Russia had conducted tests during 1955.

Effect of Atomic Tests on the Weather.—The severe and unusual storms in New England during 1954-55 focused attention on the possibility that the continued explosion of test devices both in the United States and abroad was having a profound effect on the weather. The Joint

"Swimming pool" atomic reactor, part of U.S. exhibit at Geneva Conference on Peaceful Uses of Atomic Energy.

Congressional Committee on Atomic Energy conducted a public hearing on this question, at which the leading weather experts of the United States testified. It was brought out that the changes in the weather were real—not mere statistical fluctuations—but that no quantitative theory based on well-established physical principles was adequate to account for them or to relate them to the weapons tests. This leaves open the possibility that more advanced and imaginative thinking may yet disclose a quantitative relationship between the change of weather and the tests.

JUSTUS IN THE MINNEAPOLIS STAR

"THE DIGGERS"

Nuclear Power.—Two principal facts about the industrial development of nuclear power became clear in 1955. The first was that nuclear power will possibly cost close to eight tenths of a cent per kilowatt-hour if the producer pays all costs, charges capital in the usual way, pays taxes, and keeps the nuclear materials he produces. This may be compared with a demonstrated cost of five tenths of a cent per kilowatt-hour in a coal-fired plant operated under the same conditions.

The second significant fact is the imminence of thermonuclear power plants. It has become increasingly evident that the AEC is working on a thermonuclear power plant on an ever-increasing scale, under the name of Project Sherwood. While official announcements are very cautious, and set 10 to 20 years as the probable time necessary to yield commercially significant results, veiled hints from others, and the history of atomic energy, suggest that the pace of events may be faster. A thermonuclear plant, if one can be built, would have many advantages over one based on fission. The shielding requirements would be much less, as would the problem of disposal of radioactive wastes. The problem of reworking fuel elements, one of the largest cost factors in the fission plant, would be absent or negligible in the thermonuclear plant. Most important, no uranium would be required, the power coming from heavy hydrogen, which is available in unlimited amounts. Thus, the prospect of an

early thermonuclear plant tends to retard investment in fission plants.

In spite of these two unfavorable factors, the AEC had before it, in April 1955, five firm proposals to construct fission power plants of 75,000 kw. or over. These, the first under the revised Atomic Energy Act, have been stimulated by the following concessions on the part of the commission: waiver of charges on special nuclear materials; research and development work to be performed without charge by the commission; reimbursement of the contractor, at a rate set in advance by the commission, for research and development done by him; and purchase by the commission, at rates set in advance, of the nuclear byproducts produced in the reactor. The scale of these prices has not been made known to the public.

For the first time in the United States—on July 18, 1955, at West Milton, N.Y., atomic-generated electricity was sold commercially through the lines of a private utility (see also ELECTRICAL DEVELOPMENTS).

Major construction continued at Shippingport, Pa., on the nation's first civilian nuclear power plant. This will be a pressurized water reactor of 60,000 kw. capacity. A second nuclear-powered submarine, the *Seawolf*, was launched on July 21, 1955 (see also NAVAL AFFAIRS).

Preservation of Foods.—It appears likely that the first large-scale industrial application of the radiation of fission products will be to the preservation of foods. Most foods can now be sterilized in the cold by this means. There are changes in taste, but these are not necessarily objectionable.

Liquid foods, which can be sterilized in layers one half inch or less thick, are best treated with beta rays. These, in turn, are more economically produced by conventional electric equipment than from nuclear sources. Solid foods, including meat and potatoes, are usually too thick to be penetrated by beta rays, and for these gamma rays must be used. The cheapest source of gamma rays is fission products.

The Quartermaster Corps is conducting large-scale experiments with meat. It is believed that preservation by radiation from fission products will prove cheaper than preservation by refrigeration, and that refrigerator ships may soon disappear from the seas. (See also FOOD RESEARCH.)

Atomic Science.—The anti-proton has at last been observed. Discovery of this new particle, whose existence has been postulated on theoretical grounds for more than 20 years, was easily the most important scientific event of 1955 (see PHYSICS).

Element 101 has been synthesized. Dr. Glenn T. Seaborg, working at the University of California, produced and identified 17 atoms of this new type of bombardment of element 99 with 41 Mev. helium ions from a cyclotron (see CHEMISTRY).

Biology and Medicine.—Results of experimental work in 1955 offered a certain measure of optimism, not possible a year earlier, regarding the possibility of protection against and recovery from radiation. Vital problems of the effect of radiation on living things are still unsolved, however, and extensive research toward this end continues at the commission's major laboratories.

It has been found that reducing the supply of oxygen reduces the vulnerability of human cells to gamma radiation. Reduction of oxygen supply in itself would not be a practical method

of protection, but knowledge of this effect has led to chemicals which tend to do the same thing and which may be practically useful. The first of these is cysteamine, which has been studied by Professor Z. Bacq at the University of Liège. More recently a derivative of cysteamine has been studied at the Oak Ridge National Laboratory and found to have a wider range of protective ability, and also to be less toxic than cysteamine. This and similar compounds suffer from the defect that they afford protection only if administered before or during the irradiation.

It has been found at the Oak Ridge National Laboratory that the mortality of certain strains of bacteria can be reduced by medication after the exposure. Yeast and spleen extracts, and also glutamic acid, were found to produce this effect. The recovered bacterial cells had a lower mutation rate than was expected from the amount of radiation exposure. This suggests that there may be a relation between the reduction of mutation rate and increase in survival produced by these medicines, and that both effects are produced through the same protective mechanism. Further studies are under way to determine whether these findings with bacteria can be applied to mammals.

(For further references, see the Index entry, *Atomic Energy*.)

EDWARD S. GILFILLAN, JR.,
Consultant to the National Research Council
and Other Government Agencies.

AUSTRALIA, Commonwealth of. Federated on Jan. 1, 1901, when six former colonies became states under a constitutional government, this island continent, southeast of Asia in the Southern Hemisphere, is a self-governing state within the Commonwealth of Nations, and is a member of the United Nations. The five mainland states, the island state of Tasmania, and two federal territories (in one of which is Canberra, the Commonwealth capital), have an aggregate area of 2,974,581 square miles (smaller than continental United States by only 47,806 square miles), and a coastline of 12,210 miles.* The population on the mainland and Tasmania (8,983,239 at the June 30, 1954, census), was estimated at 9,149,000 on March 31, 1955. The constituent

¹ As of June 30, 1954. ² Federal capital. ³ As of Dec. 31, 1954, excluding aborigines (full blood, 47,000; half blood, 27,000); also excluding the populations of employment camps and other groups subject to migratory influence.

* The Commonwealth also administers the Territory of Papua and the trusteeship Territory of New Guinea (see PAPUA AND NEW GUINEA, TERRITORY OF); the trusteeship of Nauru (q.v.); Norfolk Island (q.v.); the Territory of Ashmore and Cartier Islands; the Cocos (Keeling) Islands; the Antarctic islands of Heard and MacDonalld; and a region of Antarctica (q.v.) south of 60°S. latitude and between 160° and 45°E. longitude (other than Adélie Land).

states and territories, their areas, and capital cities (with 1954 populations) are shown in the accompanying table.

The People.—Augmented by controlled immigration, the population passed the 9 million mark in 1954. More than 7 million persons live in cities and towns in the coastal areas, a large part of central Australia being too dry to support human life. The 1954 census showed an urban metropolitan population of 53.91%; urban provincial, 24.79%; and rural, 21.04%. One half of the population lived in the six state capitals. The estimated increase of 1,421,000 persons since the 1947 census comprised gains of 784,000 by natural increase and 637,000 from net migration, arrivals having reached the peak inflow in 1949 and 1950 with totals of 167,727 and 174,540, respectively (reduced to 149,270 and 153,685, respectively, by emigration). The target of 100,000 immigrants set for 1953–54 was advanced to 115,000 for 1954–55, and to 125,000 for 1955–56; the immigration appropriation for the latter year was increased to £A9 million.

Government.—A governor general (Field Marshal Sir William Slim, sworn in May 8, 1953) represents the British crown and acts on the advice of a cabinet chosen from the elected members of the parliamentary majority party.

The federal Parliament comprises a 60-member Senate (10 elected members from each state) and an elected 124-member House of Representatives (including 2—one each for the Northern Territory and the Australian Capital Territory—who may take part in debates but vote only on questions affecting their territories). The governor general presides over an Executive Council composed of ministers of state as ex officio members. One half of the Senate membership is renewed each three years. Each of the six states has its own legislature (bicameral except in Queensland). Voting, based on universal adult suffrage of both sexes, is compulsory in federal elections.

A coalition (Liberal and Country parties), headed by Prime Minister Robert G. Menzies, has been in power since 1951, and retained office as a consequence of the elections held Dec. 10, 1955. Strength of the parties in the House of Representatives as a result of that election is as follows: Liberal, 57 seats; Country, 18; and Australian Labour, 49 (including 2 nonvoting representatives of territories). The party strength in the Senate is: Liberal-Country, 30; Australian Labour, 28; and anti-Communist Labour, 2.

Finance.—The Australian pound (£A) equals U.S.\$2.23, and 16 shillings sterling. For the financial year beginning July 1, 1955, total revenue was estimated at £A1,115 million and expenditure at £A1,066 million, compared with estimated revenue of £A1,050,100,000 and proposed expenditure of £A1,014,800,000 in 1954–55. In the latter year the Consolidated Fund surplus proved to be £A60 million instead of an estimated £A251,000. The income tax was expected to yield £A577 million, or £A44 million more than in 1954–55. Other revenues included customs, £A88 million; excise, £A159 million; and sales tax, £A106 million. Estimated expenditure included £A220 million to the states; £A190 million for defense (compared with actual cash expenditure of £A177,500,000 in 1954–55); and £A218 million representing total outlay from the national welfare fund (compared with £A189 million actually expended in 1954–55).

Gross domestic expenditure in 1954–55 (£A5,005 million) exceeded the value of the gross national product (£A4,832 million). Total personal incomes increased in the same period by £A157 million, or 4%, to £A3,833 million, while personal savings fell by £A80 million to an estimated £A261 million. Since 1951–52 net expenditures on goods and services by public authorities have increased by less than 7%, compared with a 27% increase in private expenditures, including a rise by 9% in personal consumption in 1954–55. Gathering signs of strain in the economy, pointing to incipient inflation, caused the government in 1955 to urge restraint upon

both public and private spending. Although the excessive demand for imports was causing a balance of payments deficit, and the banking system had been asked to curtail finance for hire-purchase business, the government, nevertheless, did not propose to institute general economic controls.

A 15-year government loan equivalent to £A6 million was raised in Switzerland in February 1955; in March the International Bank for Reconstruction and Development also made a loan of \$54,500,000 to the Australian government to finance imports of equipment for the development of agriculture and transport.

Education.—Free compulsory education is provided in state primary and secondary schools. Government schools aggregated 7,620 in 1952, with 38,407 teachers and an average weekly enrollment of 1,087,990, compared with 7,648 schools, 36,407 teachers, and an average enrollment of 1,012,874 in 1951. There were also 1,926 nongovernment schools, with 13,714 teachers and 347,831 pupils, compared with 1,890 schools, 13,251 teachers, and 326,258 pupils in 1951. Technical education is provided for in more than 100 state schools and colleges, and there is a university in each capital city. Universities, including the New South Wales University of Technology, at Sydney, and the New England University College, Armidale, New South Wales, had an aggregate student enrollment of 23,792 and teaching staff of 3,091 in 1953. In addition, the National University at Canberra provides facilities in four research schools for postgraduate research.

Social Services.—The government spent £A176,600,000 on social services in the financial year 1953-54, the largest expenditure for this purpose in Australia's history. Old-age and invalid pensions accounted for £A81,300,000, and child endowment for £A50,800,000. Expenditure on social services and health benefits was estimated at £A193,372,000 for 1954-55, including £A91,550,000 for old-age and invalid pensions, £A52,500,000 for child endowment, and £A13,065,000 for medical and pharmaceutical benefits. A rehabilitation service helps persons who are too disabled to work; in addition, unemployment and sickness benefits are payable to men between the ages of 16 and 65, and to women between the ages of 16 and 60. Hospitals numbered 696 in 1952-53; the number of inpatients treated was 939,856.

Defense.—Defense expenditure estimated in budget provisions for 1955-56 amounted to one fifth of all governmental costs. The strength of the Regular Army on June 30, 1954, was 24,414, of whom 4,177 were serving abroad; that of the Citizen Military Forces was 13,637 volunteers and 82,433 national service men. All youths of 18 years are liable for national service.

Principal ships of the Royal Australian Navy are a cruiser, 2 light aircraft carriers, 6 destroyers, 17 frigates, and 28 ocean minesweepers and ancillary vessels. A new aircraft carrier was to be commissioned at Belfast, Northern Ireland, in November 1955. Navy personnel comprised 1,200 officers and 12,657 ratings in 1954. (See also NAVAL AFFAIRS.) Royal Australian Air Force personnel numbered 14,882, with 1,569 in active reserve, 19,724 in general reserve, and 745 in the Citizen Air Force.

To meet requirements imposed by the possible use of atomic weapons, new methods of training were begun in 1955 at 23 army schools of instruction, providing 400 courses for more than 10,000 students. Additional facilities were also provided at Canungra, Queensland, for training in jungle and tropical operations, and two commando units of selected volunteers of the Citizen Military Forces were being raised for training in

guerrilla warfare. All branches of the armed forces are represented in the government's contribution to Southeast Asian defense (see below, *Principal Events, 1955*).

Agriculture.—By the beginning of the 1954-55 agricultural year, the volume of production was about 22% above prewar levels. Butter, meats, wheat and flour, other foodstuffs, and wool and sheepskins accounted for 84% of Australia's exports (excluding gold), and had a value of £A686,500,000, compared with £A130,400,000 for other exports. Beef cattle numbers, at about 10,800,000 (Queensland, 5,703,000) in 1954, reached the highest level on record. Dairy cattle totaled 4,843,000 (an increase of 97,000 over 1953); the number of sheep was estimated at 126,944,000, compared with 123,072,000 in 1953. Pigs numbered 1,197,000, an increase of 204,000 over the previous year.

The area devoted to the production of wheat for grain totaled 10,499,000 acres in 1954-55, the estimated yield amounting to 166,610,000 bushels, compared with 10,751,000 acres and 197,960,000 bushels produced in 1953-54. Other principal acreages (in thousands) and their yield in 1953-54 included oats, 2,137 (32,961,000 bushels); barley, 1,803 (41,272,000 bushels); corn, 179 (5,079,000 bushels); potatoes, 128 (548,000 tons); hay, 1,935 (3,049,000 tons); and sugarcane, 340 (9,014,000 tons). Production of whole milk amounted to 1,190,434,000 gallons; butter, 160,127 tons; and cheese, 49,230 tons. The aggregate production of fresh meat was 1,153,471 tons, including beef, 704,269 tons (New South Wales, 220,915; Queensland, 257,783); mutton, 237,566 tons; lamb, 127,246 tons; and pork, 34,448 tons.

Primary Production.—The total net value of Australian primary production was £A2,189,056,000 in 1952-53, including rural production, £A942,167,000; mining and quarrying, £A109,671,000; and forestry, £A41,864,000.

With less than one sixth of the world's sheep, Australia produces 30% of the world's wool, and 70% of all merino wool entering into world trade; about 90% of annual production is exported, the United Kingdom being by far the most important customer (315,033,000 pounds valued at £A117,526,000 in 1953-54). Total wool production was officially put at 1,244 million pounds in 1953-54, the export total of 1,088,627,000 pounds having a value of £A412,470,000. Auction sales by the National Council of Wool Selling Brokers of greasy and scoured wool amounted to 1,144,214,000 pounds valued at £A390,710,000. Production of hides included 2,707,000 cattle hides and 1,333,000 calfskins, of which 484,000 and 31,000, respectively, were exported.

Mineral Production.—All states, except Victoria, recorded an increase in the production of black coal in 1954; aggregate output was 19,757,000 tons, compared with 18,420,000 tons in 1953. Production of brown coal is confined to Victoria, where 9,331,000 tons were mined in 1954, compared with 8,257,000 tons in 1953. Gold production, at 1,075,080 fine ounces (valued at £A16,654,817) in 1953, exceeded 1 million ounces for the first time since 1942. Other mineral production (1953 output) included copper, 36,585 tons; iron, 2,132,000 tons; lead, 269,000 tons; tin, 1,553 tons; tungsten, 1,406 tons; and zinc, 239 tons.

Industrial Production.—The net value of Australia's factory production exceeds that of her rural production. By 1953-54 the work force in

factories had risen to over 1 million, and the output value of secondary industry had increased from £A868 million in 1945-46 to £A2,720 million in 1952-53 (the latest year for which full statistics are available), giving a net production value of £A1,082,801,000. Factory production employed 933,261 persons in 1952-53. In 1953-54 industrial output included canned meat, 71,400 tons (102,200 tons in 1952-53); domestic refrigerators, 276,800; soap, 60,950 tons; sugar, 459,000 tons; tobacco, cigars, and cigarettes, 20,100 tons; preserved vegetables, 19,800 tons; wheat flour, 1,601,000 short tons; confectionery, 68,950 tons; scoured wool, 68,000 tons; woolen and worsted yarn, 22,450 tons; cotton yarn, 18,950 tons; zinc, 99,200 tons; sawn native timber, 45,400,000 feet; internal combustion engines, 23,877 (including 775 marine engines); and natural and synthetic enamels, 2,674,000 gallons. The number of new houses completed in Australia by Jan. 1, 1955, was 74,906, of which those completed between July 1, 1954, and Jan. 1, 1955, were valued at £A106,544,000.

A 5-year plant construction program for the iron and steel industry, at a cost of £A67 million, was announced on March 25, 1955. The growth of Australia's iron and steel industry, in which more than 40,000 persons were employed in 1954, is shown in the following table.

Year	Pig-iron (tons)	Steel Ingots (tons)
1939.....	1,104,650	1,170,103
1952.....	1,542,063	1,638,417
1953.....	1,736,854	2,049,237
1954 (est.).....	1,830,000	2,130,000

Hydroelectric Power.—On Feb. 21, 1955, power began to flow into the electricity supply system of New South Wales from the 20,000-kw. Mungyang plant located in the Guthega section of the Snowy Mountains hydroelectric and irrigation project in the southeastern Australian Alps. A second generating plant, nearing completion, will increase output to 60,000 kw., and by 1961-62 to 660,000 kw. Total annual diversion of water from the Snowy to the Murray and Murrumbidgee rivers will be 970,000 acre feet. At an estimated cost of £A420 million, the project when completed will provide 30% more than Australia's present total generating capacity and effect a saving of £A20 million worth of coal annually. Major development projects also include the construction of power stations on the Kiewa River, the first of which was planned to begin operation in 1955, and the Eildon Dam reservoir (the largest irrigation system in Victoria) to be completed in 1956 at a cost of £A22,500,000.

External Trade.—Due mainly to a fall of about 11 pence per pound for greasy wool, export income was reduced to £A763 million in 1954-55 from £A830,627,000 in 1953-54. Imports, including freight, totaled £A936 million, compared with £A681,144,000 in 1953-54. Allowing for invisible transactions, the balance of payments position in 1954-55 showed a net deficit of £A256 million. With the expectation of reducing the total value of goods for which import licenses are issued by between £A75 and £A80 million in six months, restrictions were announced to take effect on April 1, 1955, on nondollar imports (affecting principally British exporters). Imports of near-essential and luxury goods were reduced from 60 to 40% of base year imports, while administrative import categories (including newsprint, paper, petroleum products, tea, iron and steel ingots, tires and tubes, fertilizers, and

raw cotton) were reduced by 20%. On essential goods, including machinery and raw materials for industry, the import rate was reduced by 15%. In addition, imports from the dollar area were made subject, from Oct. 1, 1955, to an overall reduction of 12.5%.

Transportation and Communications.—Of Australia's national expenditure, 30% is in the field of transport, the total of £A1,043 million in 1953 including road transport of goods, £A385 million; railway transport of passengers and freight, £A152 million; roads, £A60 million; and ports and harbors, £A48 million. Expenditure on new motor vehicles totaled £A168 million.

In 1955 there were approximately 521,000 miles of roads (152,000 improved) including nearly 90,000 miles of state highways. Some 1,947,000 registered motor vehicles as of June 30, 1954, included 1,200,000 motor cars, 607,000 commercial vehicles, and 140,000 motorcycles. All but 647 miles of the 27,455 miles of railways were operated by the federal or state governments in 1953-54, in 9 months of which passenger journeys numbered 382,269,000, and 35,801,000 tons of freight were carried; gross railway revenue was £A125,085,000; working expenses, £A120,832,000.

In 1953-54, 4,094 entrances and clearances of vessels engaged in overseas trade accounted for 8,530,000 tons of incoming and 5,752,000 tons of outgoing freight. The interstate trading fleet included 103 privately-owned vessels (429,459 dead weight tons) and 37 vessels (191,992 dead weight tons) owned by the Commonwealth government.

In 1953-54 domestic airlines operated over 95,957 miles of internal routes, flew 734,776,000 paying passenger-miles, and carried 1,814,778 paying passengers and 70,571 tons of freight. Mail-ton miles totaled 1,397,000. International services are provided by the government-owned Qantas Empire Airways, including a service between Australia, San Francisco, and Vancouver, Canada; Tasman Empire Airways (jointly owned by New Zealand and Australia); Air France; British Overseas Airways; Canadian Pacific Airlines; Royal Dutch Airlines (KLM); and Pan American World Airways.

Principal Events, 1955.—Returning to Australia on March 25 after attending the conference of Commonwealth prime ministers in London (January 31-February 8) and visits to Washington, D.C. (where he addressed both houses of Congress on March 16), Ceylon, Pakistan, the Netherlands, Greece, France, and Canada, Prime Minister Robert G. Menzies described in a speech in the Australian House of Representatives on April 1 the orientation of Commonwealth defense policy toward Southeast Asia, and especially Malaya. He stated that he had received assurances from the United States that it would hold consultations with Australian officials respecting deficiencies in Australian military equipment in this context. Meanwhile Australian navy, army, and air units would be sent to Malaya. (By the end of March 1955 an air squadron was already stationed there.) It was proposed also that Australia should participate with Britain and New Zealand in establishing a strategic reserve, with the probable overall strength of an army brigade group, as a contribution to Southeast Asian defense.

The report of the Royal Commission on Espionage in Australia (set up in April 1954 after Vladimir Petrov, third secretary in the Soviet embassy in Canberra, had been granted political

UNITED PRESS

Australian Prime Minister Robert G. Menzies addresses U.S. House of Representatives, March 16, 1955.

asylum) was made public on Sept. 14, 1955. It stated that many of the Petrov papers had been proved genuine. Evidence taken during nearly ten months of hearings showed that Soviet military and political espionage organizations, controlled directly from a special center in Moscow, had been operating in Australia, using the Soviet embassy as a cloak for their activity. The only Australians who had knowingly assisted Soviet espionage were Communists. The report, however, declared that Soviet operations "met with substantial success" in the Australian Department of External Affairs between 1943 and 1949.

On October 19, leader of the opposition Dr. Herbert V. Evatt, who was minister for external affairs from 1941 to 1949, disclosed in the House of Representatives that he had corresponded with Soviet Foreign Minister Vyacheslav M. Molotov to verify the authenticity of the Petrov documents and had been informed by him that they were "falsifications." Increasingly a political issue, the Evatt correspondence was believed to have contributed to the government's decision to hold elections in December.

In the general elections held on December 10, Prime Minister Menzies' coalition conservative government (Liberal and Country parties) won a total of 75 seats in the 124-member House of Representatives. The defeat of the Labour Party was attributed in large part to a split in its ranks over Dr. Evatt's pro-leftist leadership. In the Senate, where half the membership was up for election, a deadlock developed, with the government coalition in control of 30 of the 60 seats and the anti-Communist wing of the Labour Party holding the balance of power.

Agreement was announced on September 12 between the Australian and United Kingdom governments for further atomic tests in Australia during April 1956, some months ahead of schedule. The Monte Bello Islands, site of the first test, were again to be used. A new proving ground, at a site in the South Australian desert known as Maralinga, was to be established for the fourth series of tests.

Expanding her activities in the Antarctic, Australia announced in August 1955 that a second

research and weather station was to be established on the Polar mainland. It is to be located in the Westfold Hills, Princess Elizabeth Land, 350 miles east of the Mawson Base (established on the MacRobertson Coast in 1954) and is expected to be fully in operation before the beginning of the International Geophysical Year in 1957. The Heard Island base, operated since 1948, was dismantled early in 1955 and its installations transferred to Mawson Base. (See also ANTARCTICA.)

Lieut. Gen. Bruce C. Clarke, commander of United States Army forces in the Pacific in World War II, took part on May 8 in Australia's annual commemoration of the Battle of the Coral Sea, this year's observances being marked also by the issue of a 3½d. commemorative postage stamp by the Commonwealth government.

Preparations for the Olympic Games, scheduled to be opened by the Duke of Edinburgh at Melbourne, Nov. 22, 1956, included the beginning of construction in 1955 of a main stadium with a capacity of 110,000 spectators, and a model suburb of 837 permanent houses and apartments to accommodate athletes representing 65 nations.

Western New South Wales suffered the worst floods in the state's history in late February. More than 40 men, women, and children were dead or missing; 40,000 were homeless in 30 towns; and about 300,000 sheep, valued at £A4 million, were destroyed.

Operations started in February at the Kwinana oil refinery (the largest thus far built in Australia) near Fremantle, Western Australia; and on April 4 the prime minister officially opened an oil refinery at Altona, Victoria, extended and remodeled by a United States company at a cost of £A22 million.

Author and Publicist.

AUSTRIA. When the Austrian State Treaty* went into effect on July 27, 1955, Austria was "re-established as a sovereign, independent and democratic state" with the frontiers of Jan. 1, 1938. Comprising an area of 32,375 square miles, it ranks 19th in size among the nations of Europe, and its 1,648 miles of frontier border on six countries. It was elected to membership in the United Nations on Dec. 14, 1955.

Population.—The last general census was taken on June 1, 1951, but a census of the status of persons and businesses was taken on Oct. 13, 1953. Between the two dates the total population rose from 6,933,905 to 6,958,517; on June 30, 1954, it was officially estimated at 6,969,000. On Sept. 1, 1954, a law shifting some districts from Vienna to Lower Austria went into effect, leaving Vienna with a population of 1,616,125. Other large cities, with their 1951 populations, are Graz (226,453), Linz (184,685), Salzburg (102,927), Innsbruck (95,055), and Klagenfurt (62,782).

Government.—Dr. Theodor Körner (Socialist) was elected president of Austria by popular vote in 1951; his term will expire in 1957. The cabinet, headed by Chancellor Julius Raab (People's Party), took office on April 2, 1953, and consists of 7 representatives of the People's Party, 6 Socialists, and 2 nonparty men. On Dec. 28, 1954, Dr. Joseph Gerö, who had served as minister of justice in all post-World War II governments, died; Section Chief Hans Kapfer of the Justice Department was appointed to succeed him. Leopold Figl heads the Foreign Office.

The Federal Council, which constitutes the upper chamber of Parliament, is composed of 50 members chosen by the 9 provincial legislatures. Elections to the lower chamber (National Council), where the term is 4 years, were held on Feb. 22, 1953. The 165 seats are

* The term "state treaty" is used instead of "peace treaty" because Austria is considered a country liberated from Nazi aggression.

divided as follows: People's Party, 77; Socialists, 67; Union of Independents, 16; People's Opposition (Communist in affiliation), 5.

Education.—Education is compulsory for all children between the ages of 6 and 14. For the first 4 years they attend the *Volksschule*, of which there were 4,324 public and 102 private schools in 1954-55. In rural areas the *Volksschulen* often continue for 4 additional years. After the first 4 years the usual course is for pupils to attend either the *Hauptschule*, which offers a 4-year practical terminal course and also prepares for trade schools, or the *Mittelschule*, which prepares for the universities and higher technical schools. There were 727 public and 69 private *Hauptschulen* in 1954-55. In addition, there were 102 public (an increase of 11) and 9 private *Sonderschulen*, schools designed to fill certain special needs. The number of *Mittelschulen* was 176, of which 140 were public and 36 were supported by private organizations.

In 1954-55 (attendance at private schools in parentheses), 529,810 (14,349) pupils attended the public *Volksschulen*, 225,090 (11,586) the *Hauptschulen*, and 15,598 (579) the *Sonderschulen*. This represented a decline of 4% in total attendance from 1953-54. Attendance at *Mittelschulen* increased by 5,057 to 70,077, a gain of 7%. In 1954-55, 19,954 students attended the 14 Austrian institutions of higher education.

Religion.—According to the 1951 census, the religious affiliation of the population was as follows: Roman Catholic, 6,170,084; Protestant, 429,493; Old Catholic, 32,919; Greek Orthodox, 5,643; Jewish, 11,224; other, 17,450; none, 264,014; and unknown, 3,078.

On June 1, 1955, the Roman Catholic bishops of Austria published a white book on church and state. They demanded the re-establishment of the Austrian Concordat of 1933, which the Nazis had annulled in 1938; modification of the marriage law, including abolition of the obligatory civil marriage ceremony; full restoration of religion as a required subject of instruction in schools; and recognition of the obligation to support private schools with public funds. Theodor Cardinal Innitzer (q.v.) died on October 9 at the age of 79.

Finance.—The 1955 budget as approved by Parliament provided for an expected revenue of 22,170 million schillings and expenditures of 23,400 million schillings (26 schillings = U.S.\$1). In addition, a special budget provided 1,730 million schillings for additional investments. On Jan. 1, 1955, a 10% reduction in taxes went into effect that was estimated to increase purchasing power by approximately 2 billion schillings a year.

On May 20, 1955, the discount rate of the Austrian National Bank was raised from 3½% to 4½%. From April 12 to May 7, a group of five Austrian power companies floated a 1 billion schilling, 5½% loan. On June 14, the International Bank for Reconstruction and Development approved a 25-year, 4¾% loan to Austria equivalent to \$10 million. This second World Bank loan to Austria (the first, for \$12 million, was made in July 1954) is to be used for the Lünensee hydroelectric project in Vorarlberg.

Production.—In 1954 the Austrian gross national product was estimated at 87.8 billion schillings, as compared with 77.5 billion in 1953. The 1954 index number of general industrial production (1948 = 100), excluding manufactured gas, was 210, as compared with 184 in 1953; that of mining, 191 (174 in 1953); manufacturing industries, 212 (185); and electricity, 191 (169). Monthly figures for 1955 indicated a continuing upward trend, in line with the general prosperity of the country.

The monthly average number of unemployed was 163,800 in 1954, as compared with 183,700 in 1953. In January 1955, the figure reached 229,400, and then it began to drop until in July it had diminished to 70,700. The number of employed persons registered for sickness insurance reached a postwar high of 2,112,000 on that date.

AUSTRIA'S PRODUCTION OF SELECTED MINERALS (In thousands of metric tons)

Mineral	1937	1953	1954
Iron ore.....	1,782	2,857	2,720
Pig iron.....	389	1,321	1,350
Crude steel.....	650	1,283	1,653
Bituminous coal.....	230	162	173
Lignite.....	3,242	5,735	6,284
Crude magnesite.....	398	805	829
Aluminum.....	4	50	57

On Aug. 13, 1955, as a result of the conclusion of the state treaty, the USSR handed over to Austria the eastern Austrian oilfields, 398 confiscated industrial enterprises, and 234,650 acres of land. The restored factories account for 30% of eastern Austrian industrial production. When the Russians took over in 1945, oil production was concentrated in the Zisterdorf field. They developed three new fields—Matzen, Aderklaa, and Neusiedl—and increased the number of productive wells from approximately 200 in 1945 to 500 in 1955. Test wells are now being sunk in potentially oil-bearing regions in Upper Austria. In 1935, Austria produced 6,600 tons of oil; in 1938, 56,000. Estimates of production in tons for later years are: 1944, 1,213,000; 1945, 450,000; 1947, 950,000; 1949, 1,200,000; 1951, 2,100,000; 1953, 3,200,000; 1954, 3,200,000. Austria now ranks next to Rumania as Europe's second largest oil producer. Refining capacity is estimated at 1,800,000 tons of crude oil. Plans call for equipping the refineries with modern cracking installations, which it is expected will increase gasoline extraction from the present 14 or 15% to 35 or 40%.

Employment in Austrian nationalized industries increased from 100,000 to 108,000 in 1954. Since 1949, production of nationalized industries has increased 78%, while the overall Austrian industry increase was 58%. To what extent the enterprises returned by the Soviet Union will be nationalized has not been determined.

Electricity production and export of power continue to rise. In 1954, Austria produced 9,845 million kw.-hr. (7,260 million hydroelectric), as compared with 8,764 million (6,430 million hydroelectric) in 1953, and exported 1,447 million (1,296 in 1953).

Approximately 22% of the Austrian people are engaged in agriculture. Of the 400,000 farms, 85% have an arable area of less than 50 acres, and only 1% have more than 250 acres. Austria produces about 82% of its overall food requirements. Dairy and meat production exceeds domestic needs, and 68% of wheat, 91% of rye, 92% of barley, and 98% of oats requirements are met by Austrian farms. Withdrawal of the occupation forces places approximately 375,000 additional acres of farm and forest lands at Austrian disposal. Austria exported about 106 million cubic feet of lumber in 1954, ranking next to Canada and Sweden as the third largest lumber-exporting country in the world.

Foreign Trade.—Imports in 1954 (figures for 1953 in parentheses) amounted to 16,987 million schillings (13,269), of which 514 million schillings (917) were direct Mutual Security Program

Austrian prisoner, one of first group to be released by USSR, is welcomed home by his mother, April 29, 1955.

(MSP) aid. Exports amounted to 15,851 million schillings (13,187), leaving an unfavorable commercial trade balance of 622 million schillings, as compared with a favorable balance of 835 million schillings in 1953. By volume, imports totaled 8,230,000 metric tons (7,435,000), of which 141,000 were MSP aid (318,000); exports amounted to 5,415,000 metric tons (5,212,000). Figures for the first seven months of 1955 show imports of 12,644 million schillings and exports of 9,984 million.

On Aug. 1, 1955, Austria had a cumulative credit (since July 1950) of \$22.8 million with the European Payments Union. During the first part of 1955 it ran a monthly deficit, but in July it recorded a surplus of \$9.6 million.

Transportation and Communications.—Austria has 3,727 miles of railway lines, of which 848 miles were electrified by the end of 1954. On June 10, 1955, the Allied Council authorized Austrian civil aviation, and the minister of communications and nationalized industries subsequently announced that a publicly owned Austrian airline would be established. The state treaty prohibits Austria from acquiring or manufacturing civil aircraft of German or Japanese design. In 1955, 12 foreign airlines serviced Austria's 8 major airfields—Vienna (3), Linz, Salzburg, Graz, Klagenfurt, and Innsbruck. In the first six months of the year, 1,800 planes arrived and departed, carrying 48,673 passengers, plus 7,989 who were merely in transit.

Austrian State Treaty is signed in Vienna, May 15, 1955. Seated (l. to r.) are: U.S. Secretary of State Dulles, Soviet Ambassador Ilyichev, Soviet Foreign Minister Molotov, Austrian Foreign Minister Figl, British Foreign Secretary Macmillan, British Ambassador Wallinger, and French Foreign Minister Pinay.

Approximately 45 miles of the Salzburg-Vienna Expressway are well under construction, and contracts for 23 more miles were placed for 1955. Of Austria's 55,000 miles of roads, about 5,500 are under the supervision of the Federal Highway Administration. As of April 1955, there were 539,340 motor vehicles, of which 110,244 were passenger cars; 3,987, buses; 56,918, trucks; 41,364, trailers; 48,146, tractors; 5,059, special motor vehicles; 1,823, three-wheel motor vehicles; 158,292, large motorcycles; and 113,507, small motorcycles and scooters.

On May 14, 1955, Austria and Rumania signed an agreement regulating traffic along the Danube. Freight traffic on the river in Austria totaled 2,558,421 tons in 1954 (2,599,437 tons in 1953), and 1,398,989 tons in the first six months of 1955.

On April 1, 1955, there were 1,701,805 radio taxpayers. Austria began combined television-radio transmission with the 1955 Salzburg Festival, held on July 24-August 30.

Principal Events, 1955.—The year began with a criticism by the Soviet high commissioner, Ivan I. Ilyichev, in the Allied Council on January 14 of the presence of 300 United States supply troops in the French sector. These had been there for years, and raising this issue, along with the Soviet complaint about the appropriation in the budget of 187.6 million schillings for training police forces, made it appear that the USSR would make difficulties in Austrian affairs. On January 15, Dr. Alfred Sokolowski, municipal counsellor and official interpreter, was arrested by the Russians. This led to sharp protests both by the Vienna City Council and by Chancellor Raab. The Russians on February 5 in turn sent a note to the United States embassy protesting American attempts to get B. Y. Nalivaiko, the Russian consul in Vienna, "to commit high treason." Russian officials at various times confiscated certain issues of the Socialist *Arbeiter Zeitung*.

Although Russian bickering and interference did not cease forthwith, a new approach to Austrian affairs was forecast in Vyacheslav M. Molotov's foreign policy report to the Supreme Soviet on February 8. After remarks on the relation of the issue of German rearmament to the Austrian problem, he intimated that if satisfactory guarantees against future Anschluss were agreed upon, withdrawal of the occupation troops from Austria could be arranged without waiting for the conclusion of a peace treaty with Germany. He also indicated that Austria must agree not to join a

UNITED PRESS

military alliance and not to permit military bases on its territory. Austria should be invited to a four-power conference at which the situation might be examined. It is possible that the change in Soviet policy was in part influenced by the preparation for the 8-nation Eastern defense treaty, which made the USSR no longer dependent on Austrian occupation for an excuse to maintain troops in the satellite countries.

Molotov held major discussions with Norbert Bischoff, the Austrian ambassador at Moscow, on February 25 and March 2, and on March 14 the Austrian government officially replied to the Russian proposals. Austrian assurances with regard to future policy were considered satisfactory. On March 24, the Soviet authorities, accepting the Austrian suggestion for further discussions before a meeting of the four powers, invited the Austrian government to send representatives to Moscow for a conference. The invitation was accepted on March 29, and on April 11 Chancellor Raab, Foreign Minister Figl, and a small delegation of officials went to the Russian capital. Meanwhile, on April 5, the three Western powers issued a declaration expressing their willingness to conclude an Austrian treaty and their hopes that the Moscow meeting would lead to a useful clarification of issues.

The Moscow Conference.—On April 15, at the close of the Austro-Russian talks, a joint communiqué was issued. Austria again gave assurances on its future, independent, nonmilitaristic policy. The USSR agreed that occupation troops should be withdrawn on conclusion of a treaty, but not later than Dec. 31, 1955. The Soviet Union further agreed to accept the equivalent of \$150 million in deliveries of Austrian goods in payment for Russian-held German assets in Austria; to return for compensation (announced on April 22 to be \$2 million) the property of the Danube Shipping Company); and to cede Russian rights to Austrian oilfields and refineries in exchange for deliveries of crude oil (later announced to be 10 million metric tons over a period of 10 years). The negotiation of a trade treaty between the two countries was to begin immediately.

The agreement was hailed by the Austrian people and viewed favorably on the whole by the Western powers. On April 19, the Soviet government called for a Big Four conference, which was to include Austria, to conclude the Austrian State Treaty. The Western powers countered on April 22 with a suggestion that the Big Four ambassadors at Vienna work out the remaining details of the agreement with Austrian representatives. This proposal was accepted on April 26.

Signature of the State Treaty.—The ambassadors started their discussions on May 2. There were many changes necessary in the treaty draft that had been evolved since the first meeting of foreign ministers' deputies on Austria on Jan. 3, 1947. The draft as it stood consisted of 59 articles, but it was reduced to 38 articles and a series of annexes. Difficulties arose over the fate of refugees and the size of the Austrian Army, but the Soviet Union surrendered its position, and articles touching on these problems were dropped. The Soviet authorities insisted, however, on retaining within the treaty a clear statement of Russian rights to German assets in Austria, while the Western powers insisted that the settlement of this issue should also be dealt with in the treaty. A compromise was worked out by adding to Article 22 (confirming Russian rights) Section 14, which states: "The provisions of this

article shall be subject to the terms of Annex II of this treaty." In this annex, the Austrian-Soviet memorandum of April 15, 1955, which deals with the surrender of Austrian assets, becomes part of the treaty. One significant reservation provides that the Soviet government shall retain the assets of the Danube Shipping Company in Hungary, Rumania, and Bulgaria.

On May 13, the ambassadors finished the final drafting of the treaty, and the foreign ministers of the United States, Great Britain, and France arrived in Vienna, to be followed on the next day by Molotov. The four foreign ministers agreed on May 14 to delete paragraph 3 of the preamble to the treaty, thus recognizing that Austria bore no responsibility for World War II. They also came to an understanding on a declaration to be made by Austria regarding her future neutrality. (On June 7, the Austrian Parliament adopted a neutrality declaration in conformity with this agreement.) The treaty was formally signed at Belvedere Palace on May 15, 1955, by the foreign ministers and ambassadors of the four powers and Foreign Minister Figl of Austria.

Terms of the Treaty and Its Implementation.—Austria is recognized as an independent state with the frontiers of Jan. 1, 1938, and Anschluss with Germany is forbidden. Austria undertakes to protect human rights, and there are special safeguards of the rights of Slovene and Croat minorities. Austria further obligates herself to complete measures for the destruction of the National Socialist Party and to prevent its future activity. There are fairly detailed military and air clauses, but the size of the future Austrian Army is not limited. Austrian war prisoners are to be repatriated as soon as possible. Allied forces are to be withdrawn within 90 days of the coming into force of the treaty, but no later than Dec. 31, 1955.

As indicated above in the section on *The Moscow Conference*, the treaty contains a statement of the Soviet Union's right to former German assets in Austria, and also of Soviet willingness to return them for compensation. With regard to these assets, Austria obligates herself "except in the case of educational, cultural, charitable and religious property" not to return them to German juridical persons, or to return any property worth more than 260,000 schillings to German natural persons. Austria further agrees not to transfer to foreign ownership the oil properties or the Danube Shipping Company returned by the USSR. On the other hand, long articles deal with the restitution of assets to members of the United Nations and their nationals (Art. 25), and to minority groups and victims of racial and religious persecution (Art. 26). Austrian assets in Allied territory are to be returned except in the case of Yugoslavia. Arrangement is made for establishment of a conciliation commission to solve any dispute arising about "United Nations Property in Austria." Free navigation of the Danube is assured. Any other member of the United Nations which on May 8, 1945, was at war with Germany may accede to the agreement and become an "Associated Power for the purposes of the treaty." (The National Assembly of Czechoslovakia voted to do so on August 30.)

No reparations are to be exacted, but under the Moscow agreement of April 15, as indicated above, Austria must pay the USSR compensation for the return of certain property. On July 12, the Soviet and Austrian governments reached an agreement on the shipment of goods to the USSR. These are to be delivered at world market

INTERNATIONAL BUSINESS MACHINES CORP.

"Autofab," used here to speed production of air defense computers, will test and insert from 1 to 24 electronic components in printed circuit boards.

prices and are to enter the Soviet Union duty free. If Austria cannot deliver goods to fill its annual quota, the USSR will accept the balance in dollars. The agreement provides for annual shipments of 200,000 tons of oil, as well as steel plate, galvanized sheet metal, mill equipment, and other items, for six years. (The 200,000 tons of oil is in addition to the 1 million tons to be shipped annually for 10 years in payment for the oilfields.) On July 2, a number of 5-year trade agreements were signed in Moscow providing for an annual exchange of approximately 650 million schillings worth of goods in both directions.

During the July negotiations, Austria also agreed to a payment of 508 million schillings to the Soviet Military Bank to clear its loans to enterprises now returned to Austria. The Soviet bank discontinued operations on July 16. In addition, Austria agreed to pay 67 million schillings for supplies which had been delivered to the enterprises from the Soviet warehouse. On the other hand, the USSR relinquished free of charge 2,750 railroad tank cars and several hundred steam locomotives which it had always claimed as war booty.

The state treaty was rapidly ratified by all the powers concerned* and officially went into effect on July 27, 1955. On the same day the Allied Council in Vienna held the 249th meeting since its establishment in 1945 and decided to discontinue activities. The occupation troops were withdrawn within the specified 90 days (Oct. 25, 1955).

On July 18, Chancellor Raab and Dr. Nahum Goldmann, president of the World Committee for Jewish Claims, agreed that Austria would provide \$22 million for indemnification of Austrian victims of Nazi persecution now living abroad. On September 7, Austria adopted its new defense law, which provides for general military

* Ratification of the treaty was approved by the U.S. Senate on June 17, and was signed by President Eisenhower at Lancaster, N.H., on June 25.

service for a 9-month period. On September 14, the international patrol of inner Vienna was disbanded.

Several transports of Austrian prisoners have arrived from the Soviet Union. The Austrian authorities are apparently screening refugees from Iron Curtain countries far more closely than heretofore, and this has caused concern at the International Refugee Organization headquarters in Geneva. The Austrian government has denied any secret agreement with the USSR on the repatriation of refugees.

Other Events.—Local municipal elections held in Soviet-occupied Lower Austria on April 24, 1955, showed a further decline in the Communist vote. Prime Minister Jawaharlal Nehru of India paid an official visit to Vienna on June 26–27. On September 9, Parliament adopted an important social insurance law covering the entire field of sickness, accident, and pension insurance. The new Burgtheater on the Ringstrasse in Vienna was officially opened on October 14. Then, on November 5, came the opening of the rebuilt Vienna Opera House, with a gala performance of Beethoven's *Fidelio*. It was a fitting celebration for the year of liberation.

AUTO RACING. See SPORTS, GAMES, AND SHOWS.

AUTOMATION. Automation is a phase of our technological advance—the continuing improvement in the tools we use. It had its start when the desire to lessen physical work, to do things more quickly and effectively, became recognized. Ultimately man learned to make combinations of wheels, shafts, and other parts into machines. Power was added, and the powered machine was then programmed or given a work directive. Finally control was introduced to check, and correct if necessary, the machine's output.

Except for the feature of control, automation first made its appearance in United States industry in 1784, before the industrial revolution had really begun. In that year Oliver Evans built an automatic factory to produce flour in a continuous process mill. No manual labor was required from the time the grain was delivered to the mill until it had been converted into flour.

There are sound, economic reasons for continued mechanization, or automation. A rapidly increasing population, a greatly stepped-up demand for consumer goods and services, and the prospect of a proportionately smaller labor force to produce them, make further technological development mandatory. Moreover, business organizations, to survive in the face of intense competition, must be alert to find new and better ways to turn out higher quality products at ever-lower prices. Those industries that have adopted mechanized means of increasing their output have succeeded in reducing the cost of their products, have improved their products, and have enlarged their markets.

The fluid processing industries, such as chemical and refinery operations, provide the best examples of automation. Having been able to convert from batch to continuous-processing techniques, these plants have achieved almost complete automation except for certain sampling and control operations still requiring mental decisions and manual adjustments or control.

The fabrication industries, in general, have been less adaptable to continuous processing,

and have lagged behind somewhat in automatizing their operations. It is only recently that limited advances in the direction of automation in these industries have been successful. For example, only the simplest operations in the modern automobile engine-block machining plant have been automated. Most of the operations to complete the engine still require a large number of operators and supervisors.

The electronics industry, except for a few isolated instances, has recently made the initial step in automation by developing automatic machines to assemble or fabricate electronic components to form a finished unit. The use of printed circuits (conductive metal lines printed or etched on a plastic board) and the development of continuous materials-handling techniques have led to the mechanization of electronics equipment fabrication. Machines have been developed which will test the electronic components, install them on a printed circuit board, and join the components to the printed circuit by dipping the board in molten solder; one such machine is the "Autofab" developed by General Mills, Inc. This process is followed by equipment which tests the components and circuits after assembly on the board. Other machines will even form some of the electronic components as part of the assembly process to complete a finished unit.

The new field of electronic data processing has begun to automate many office functions. A single electronic computer can handle all functions necessary to complete a payroll for tens of thousands of employees, even to the printing of the paychecks, in about six hours. Electronic computers now can handle all of the check sorting, accounting, and statement printing for large banks. They handle all of the computations and accounting for large loan and insurance companies. Other computers can perform very complex engineering and scientific computations in a fraction of the time taken for the manual operation.

Automation is making its way into grocery stores, gasoline service stations, and department stores. Invoices carrying name and account number can be "read" by a photoelectric cell, or equivalent reader, and an electronic system capable of recognizing printed characters. This new system soon will be performing automatic data processing for major oil company charge-account filing operations. Tabulating card invoices imprinted at the point of sale are checked against the customer's credit card identification. The system verifies the accuracy of the account number, then automatically key-punches the scanned data into the original invoice card. It can also be operated with an adding machine to key-punch the dollar amount of sale for billing later.

These few examples of automation in use today give some indication of what may be in store for the future. Lest the word automation immediately conjure up visions of factories wherein production moves throughout the plant in one uninterrupted flow, it should be stated that complete push-button factories are a long way from reality. Improvements will come gradually, step by step, to whatever ultimate degree of mechanization may prove warranted economically.

Automation is expected to produce an increase in manpower requirements. Elimination of many processes of a monotonous, repetitive nature will mean the freeing of men for positions requiring higher skills. The assembly-line operator of today can and will be looking forward to

the more interesting and high-paying jobs of machine assembler, draftsman, designer, tool and parts maker, test engineer and trouble-shooter, etc. Job changes have always come about as a direct result of technical innovations and new production systems, and these job changes, as the history of the last 50 years indicates, have always meant better opportunities, better-paid jobs for labor.

As automation increases in industry, it should result in a still higher standard of living, more and better jobs, and in the long run more leisure time for health, recreation, and cultural activities.

AUTOMOBILES. The year 1955 was in many ways the most eventful in the history of the American automobile industry. New marks were established in the production and sales of passenger cars, and sweeping changes in design and engineering made the average car much more powerful and luxurious than it had ever been in the past.

Production and Sales.—Record-breaking production of automobiles in December 1954 gave strong indication of what was to come in 1955. With this flying start, car makers continued to establish new production marks in six of the first seven months of the year. Not until late August, when shutdowns for changing to 1956 models began, was there any considerable slackening of the production rate.

U.S. POSTWAR MOTOR VEHICLE PRODUCTION

Year	Passenger cars	Commercial vehicles
1945.....	69,532	655,683
1946.....	2,148,699	940,866
1947.....	3,558,178	1,239,443
1948.....	3,909,270	1,376,274
1949.....	5,119,466	1,134,185
1950.....	6,665,863	1,337,193
1951.....	5,338,436	1,426,828
1952.....	4,320,794	1,218,165
1953.....	6,116,948	1,206,266
1954.....	5,558,897	1,042,174
1955.....	8,000,000*	1,250,000*

* Preliminary estimate. (Source: Automobile Manufacturers Association.)

By Labor Day, the entire 1954 output had been surpassed, and on Oct. 1, 1955, the 6 million mark in passenger cars was passed. This was more than seven weeks ahead of the 1950 pace, when the previous record for production had been established. In that year, the 6 millionth passenger car came off the assembly line on November 22, and the year's total was 6,666,000. Even with output slowed for changeovers in September and October 1955, schedules called for about 2 million passenger cars in the last quarter, bringing the 1955 total to about 8 million.

Trucks and buses were not produced at record speed, but a better-than-average output of about 1,200,000 commercial vehicles carried the total production of motor vehicles over the 9 million mark for the first time.

Passenger car sales in 1955 followed closely after production in their record-breaking pace. After only moderately heavy sales in January and February, registrations leaped over the 600,-

* Forecast. (Source: Automobile Manufacturers Association.)

Not only did American motorists buy more cars than ever before, but they insisted on more and more in the way of power assistance and luxury equipment. Automatic transmissions continued their rapid rise in popularity, 69% of the new cars being so equipped. In 1954, 58% of new cars were "automatics," and the increase in sales from about 3,200,000 to over 5 million automatic transmissions in one year indicated that the predicted 100% automatics might not be too distant. Even the Ford-Chevrolet-Plymouth class installed automatic transmissions on more than half of its output. Average for the rest of the industry was close to 90%.

Newer power assists, such as power brakes and power steering, made less spectacular but still significant rises. Approximately one new car in four was equipped with power steering in 1955, and power brakes were not far behind in popularity. Most luxurious item of all—air conditioning—was installed on about 175,000 new passenger cars in 1955, more than tripling the 1954 figure. Appreciable gains also were made in sales of power window lifts and power-adjusted seats.

Most lines in earlier automobile history had registered most of their sales with a "price leader"—usually the four-door or two-door sedan. In 1955, however, the more expensive sport

coupe, or "hard top," continued to rise in demand, becoming second only to the four-door sedan in sales. Principal construction feature of the hard top is elimination of the center posts. Added to this is a lowering of the roof, to give a "sporty" appearance and openness approximating that of the "soft top" convertible. Buick and Oldsmobile introduced the four-door counterpart of the sport coupe in 1955, and its immediate acceptance indicated that the hard top sport sedan might eventually supersede the conventional four-door sedan.

Another trend in public taste was toward a greater preference for larger makes of cars. The low-priced three—Chevrolet, Ford, and Plymouth—all registered large increases in sales in 1955, but their combined output held a smaller share of the market than in 1954. During 1954, Chev-

Buick Roadmaster

Continental Mark II

Studebaker Pinehurst station wagon

Ford Victoria

AMERICAN AUTOMOBILES—1956

rolet, Ford, and Plymouth sold 57.5% of all cars marketed by American makers. This figure declined to about 52% in 1955.

Foreign cars made a greater impression in the 1955 United States market, increasing sales by about 70% over 1954. Almost half the foreign car sales were German Volkswagens.

Engineering.—The most radical engineering change introduced in 1955 was the torsion bar suspension system inaugurated on the Packard. Eliminating the front coil and rear leaf springs, the suspension consists of a long bar running on each side of the frame, connecting each front wheel with the corresponding rear wheel by means of arms and links. Springing action is obtained by twisting of the bars. A load compensator made up of two additional bars and an electric motor drive is designed to insure a level ride regardless of variations in loading. The torsion bar suspension is said to improve riding qualities and to give increased stability at higher speeds.

The "horsepower race" continued at an accelerated rate, with the average horsepower in American cars jumping from 150.8 to 173.1. Average compression ratio rose from 7.64 to 7.96, with Buick and Cadillac boasting the high ratio of 9.0 to 1. The top ratio in 1954 had been 8.7 to 1. No 1955 American car had a compression ratio below 7.2, whereas the 1954 minimum was 6.8.

Contributing heavily to the rise in horsepower was a continuation of the movement toward V-8 engines. Chevrolet, longtime sales leader with its six, came out with an 8-cylinder V-type valve-in-head engine boasting 162 hp. Plymouth joined the V-8 class with two engines, of 157 and 167 hp. Ford, in turn, raised its V-8 horsepower to 162. Line eights disappeared from the scene in favor of V-type engines, and only eight manufacturers retained their sixes. Up to 300 hp, was made available in the larger car class.

Most manufacturers offered optional "power packs" to boost the horsepower of standard engines. Usually consisting of a 4-barrel carburetor, together with a modified intake manifold and exhaust system, the power pack proved to be so popular that demand far exceeded production.

New emphasis on safety features showed up in the form of modified steering wheels, padded instrument panels, and optional seat belts to minimize the likelihood of injury in collisions. All manufacturers worked to develop door latches which would not open on impact, and some cars offered safety latches as standard equipment during the last half of the year.

Styling.—Entirely new bodies were offered by 10 manufacturers, with the "long, low, wide" appearance again emphasized. Horizontal lines were particularly stressed by sweeping rear fenders. Narrower grilles changed the front appearance of some makes, and several introduced perforated mesh grillework. Further differences took the form of unusual treatment of the chromium-plated molding on the sides.

Upholstery and interior trim were made more luxurious by new color combinations and materials. The "wraparound" curved windshield, designed to give a cleaner appearance and afford better visibility to the driver, became general throughout the industry.

Perhaps the most notable feature of the 1955 automobile crop was the variety of color. The two-tone car had been gaining headway for several years, but in 1955 the multicolored car became overwhelmingly predominant. Many colors were available that had never been seen on automobiles in the past, and the choice of combinations was almost limitless.

Three-color combinations were offered by some makes, and in others with only two colors there were three color areas. Whites and off-whites, which had made their bare beginnings only about two years earlier, were much in evidence. One survey taken in late summer, however, indicated a slight trend away from the brightest colors so prominent in late 1954 and early 1955.

Employment.—With production at a record high level through most of 1955, employment in the auto industry also was good. Payrolls totaled about 910,000 on the average, including well over 700,000 production workers. Both figures were among the highest in history.

Labor negotiations were prominent in the news in the spring and summer, when the old

contracts of all major companies with the UAW-CIO expired. Seeking a guaranteed annual wage, the union reached agreements with the "Big Three" manufacturers providing for payments to supplement state unemployment insurance during layoffs. American Motors (Nash and Hudson) signed a similar agreement, but with the unemployment pay provision postponed about a year. Studebaker-Packard and Willys still were in negotiation at the middle of October. The only strike of major consequence was a 10-day stoppage at Studebaker. (See also LABOR.)

Preparations for 1956.—Anticipating another big year in 1956, American car manufacturers spent large sums of money to enlarge and improve their production facilities.

New models began to come out in September, with only relatively minor "face lifting," in many cases, to distinguish the 1956 cars from their 1955 counterparts. The earliest makes to market 1956 models restricted exterior changes to restyling of grilles, lights, and body side molding. There was some lowering of roof lines, and one large manufacturer (Chrysler Corporation) featured "tail fin" styled rear fenders. Most makes added 4-door hard tops to their lineup of body styles.

Engineeringwise, the accent continued to be on increased horsepower. One of the best-known luxury cars had a 305-hp. engine, and the popular low-priced cars went above 200 hp. Push-button controls for automatic transmissions were installed on several lines; one of the most popular automatic transmissions, used on a number of makes, incorporated an added fluid coupling for smoother operation.

The number of cars offering safety door latches increased, and several makes began extensive advertising campaigns which stressed safety features.

Cadillac scheduled its Brougham, a radically different 4-door, 4-passenger coupe, based on its 1955 Motorama "dream car," for release in early 1956. Another limited-production luxury car, the Continental Mark II, was brought out by the Ford Motor Company.

Director and Research Consultant, General Motors Corporation.

AVIATION. See AERONAUTICS.

AVILA CAMACHO, Manuel, former president of Mexico: b. Teziutlán, Puebla, April 24, 1897; d. near Mexico City, Oct. 13, 1955. President of Mexico during World War II, he gave his country an administration marked by moderation in internal affairs and by cooperation with the United States, after a long period of domestic social unrest and of friction with Mexico's northern neighbor.

After finishing a course in accounting in 1914, he joined the rebel army of Venustiano Carranza in an ultimately successful revolt against the regime of Victoriano Huerta. In joining the winning

side, Ávila Camacho showed for the first time his remarkable ability to "guess right" in the stormy seas of Mexican politics during the next two decades. Rising in the army from 2d lieutenant to division general, he early acquired the reputation of being a highly skilled administrator. His successful reform of the army, when he was chief of staff of the Ministry of War and Navy under President Abelardo Rodríguez, led to his appointment in 1937 as minister of national defense by his long-time friend, President Lázaro Cárdenas. In 1939 Ávila Camacho resigned from the cabinet to seek the nomination for president from the government party, the PRM (Party of the Mexican Revolution). After a far from orderly campaign, in which the radical program of outgoing President Cárdenas was at issue, Ávila Camacho was elected on July 7, 1940, by an overwhelming majority over the opposition of Gen. Juan Almazán.

Immediately after his inauguration on Dec. 1, 1940, his presidential acts exhibited the more moderate tone his administration was to take. His campaign pledges to foster better relations with the United States were fulfilled in a number of ways. In 1941 a settlement of the oil expropriation controversy was negotiated, and in the early years of World War II Mexico supplied much-needed raw materials to the United States. Mexico itself declared war on the Axis powers in 1942. As a further reflection of his international outlook, Mexico joined the Bretton Woods agreements and signed the United Nations Charter during his term of office. With respect to internal affairs, one of his early presidential acts was to inaugurate a strenuous program to reduce illiteracy. He also brought to completion the land reforms inaugurated by his predecessor and contributed to the expansion of Mexican industry.

On Dec. 1, 1946, he was succeeded in the presidency by Miguel Alemán. He remained politically active as head of a strong political machine in his native province of Puebla.

AWARDS AND PRIZES. See PRIZES AND AWARDS.

AZORES or WESTERN ISLANDS (Port. Açores). A group of 9 main islands and several islets in the Atlantic about 800 miles off the coast of Portugal. Area, 888 square miles; pop. (1950), 318,686. São Miguel Island is the largest of the group and contains the Azores' chief city, Ponta Delgada (22,706). Politically the Azores comprise three districts of Portugal. Agriculture is the chief occupation. Manufactures include wines, linens, woolen garments, and embroideries. Fish yields are mainly tuna, bonito, and mullet. The Azores serve as a transatlantic cable station and a stopping point for aviation. United States rights to airbases on the islands were renewed and extended by agreement with Portugal in 1951. The agreement integrated the Azores facilities within the North Atlantic Treaty Organization.

BACTERIOLOGY. Microorganisms in Cancer

Research.—Microorganisms are assuming three roles in studies concerned with cancer. The first is that of etiology. Viruses have long been known to cause malignant growths in lower animals such as rabbits and chickens. Virus-like particles have been described in numerous human malignant growths, and the inference is made that they might be the etiological agents of the tumor. It has also been reported that highly pleomorphic bacteria have consistently been isolated from human malignant growths, and that these bacteria go through a virus stage at one step in their life cycle. These bacteria, when cultivated in the laboratory and then inoculated into experimental animals, yield tumor growths in some of these animals that are compatible with a malignant process.

A second role is their use as a tool in understanding how malignant tissue originates as a mutation of the somatic cell. It might be expected that chemical and physical agents which are carcinogenic should also be mutagenic. The ease of generating huge numbers of bacteria in the laboratory makes it possible to isolate mutants induced by various carcinogenic agents. In general, induced mutants in a bacterial population will occur at the rate of approximately one per million bacteria. The bacterial mutant may be selected for any number of specific traits, for example, alterations in color or texture of the colony, in the ability to grow in the absence of an essential metabolite, in resistance to antibiotics, or in susceptibility to destruction by the bacterial viruses called phage. Bacteria, yeasts, and various molds, when subjected to carcinogenic chemicals, mutate in a manner which indicate that the alteration is essentially a gene mutation which in some instances may be reversible. In general, greater numbers of microbial mutants are induced with the stronger carcinogens, as compared with weaker carcinogens of related chemical structure. Further study of the response of bacterial cells to carcinogenic agents may yield an insight into the response of animal cells to these agents.

Microorganisms may play a role in the possible therapy of cancer. The theory of "antimetabolites" proposes that a biochemical reaction essential to a cell may be blocked by the introduction of an agent which closely resembles in molecular structure the metabolite used in the biochemical reaction. The antimetabolite molecules take up positions in the enzymes responsible for this biochemical reaction by competing with the essential metabolite, but are sufficiently different in structure to be unavailable for the reaction. They thus interfere with a necessary function of the cell, leading ultimately to the death of the cell. A number of effective anticancer agents have been discovered on the basis of their reported activity against bacteria as antimetabolites. The folic acid antimetabolites, aminopterin and A-methopterin, are among such agents which are currently being used in the treatment of leukemias in man.

Petroleum Bacteriology.—Certain bacteria in soil have the capacity for growing in a medium containing the group of organic chemical substances called hydrocarbons. Certain of these hydrocarbons when found in the soil are believed to emanate from subsurface deposits of petroleum. The thesis has been proposed that the detection in the soil of bacteria which can oxidize hydrocarbons would be indicative of the presence

of a petroleum reservoir. In accord with this thesis, it has been reported that there are as many as 50 billion hydrocarbon-oxidizing bacteria per pound of oil-bearing rock, whereas none are present in rock samples free of oil. A number of United States patents have been granted which describe methods of exploiting this principle.

Explorations for petroleum, utilizing bacterial studies of the surface soil as guides, have been successful. It is believed that bacterial action on certain chemical constituents of the soil could in part be responsible for the formation of petroleum. Because of the physical environment present below the surface of the soil, it would be necessary that these bacteria perform their activity in the absence of oxygen, at elevated temperatures, and at increased pressures. Bacteria have been found which can metabolize anaerobically, will grow at temperatures of 75°C., and can withstand pressures as high as 75,000 pounds per square inch. Utilizing a microorganism called *Desulfococcus*, growing on a substrate of carbonate, sulfate, and other mineral salts in a hydrogen gas atmosphere, an oily deposit was produced in the laboratory having many of the attributes of natural petroleum oil.

A disturbing role of bacteria in the petroleum industry has to do with the capacity of certain bacteria to convert sulfur-containing mineral salts present in soil to substances which will corrode iron. The iron in the case of iron pipe will corrode, leaving a pipe which still appears normal because of the intact graphite, but which is so soft it can be cut with a knife. Attempts to stem this bacterial corrosion have necessitated the widespread use of germicides in drilling pipes. The bacteriologist has thus joined the geologists and geophysicists in the petroleum oilfields.

Poliomyelitis Vaccine.—On April 12, 1955, Dr. Thomas Francis, Jr., and his colleagues reported from the University of Michigan their evaluation of the successful field trial of the Salk vaccine for poliomyelitis. (See POLIOMYELITIS.) Mass immunization was undertaken, with the subsequent discovery of live polio virus in lots of vaccine.

The ensuing cases of poliomyelitis which resulted might in part have been due to the increased size of the batches of vaccine manufactured. The possibility was also proposed that the inoculation of a vaccine, albeit with dead virus particles, could trigger the multiplication of polio virus already present in small numbers in normal and apparently healthy individuals. Another potential risk of the Salk vaccine is the possibility that vaccine made from monkey kidney tissue might sensitize some individuals to kidney protein, with the subsequent risk of an allergic nephritis. To avoid this danger, propagation of poliomyelitis virus on human placental tissue (a method discovered in 1955 at the University of California) has taken on an added significance. All three types of polio virus will multiply in tissue cultures thus prepared. Human placental tissue can be readily procured from hospitals, one placenta adequately replacing the kidneys from one monkey in the propagation of the virus.

MILAN V. NOVAK,

Head of the Department of Bacteriology, College of Medicine, University of Illinois.

BAGHDAD PACT (MIDDLE EAST TREATY ORGANIZATION). Originally signed at Baghdad by Turkey and Iraq on Feb. 24, 1955, and later adhered to by Great Britain (April 5), Pakistan (September 23), and Iran (November 3), the Baghdad

Pact is one of several mutual security alliances designed to halt possible Communist aggression. The pact—bitterly opposed by Egypt, for nationalist reasons, and by the USSR, for its obviously anti-Communist character—is part of a chain of mutual defense alliances which include the North Atlantic Treaty Organization (NATO) and the Southeast Asia Treaty Organization (SEATO), and which extended in 1955, with the exception of India, from the Philippines in the Pacific to Iceland in the North Atlantic. The new alliance is often referred to as the Middle East Treaty Organization (METO).

Although the United States is not a member of the Baghdad Pact, it supports the member nations through military and economic aid and acts as an observer at the organization's meetings, the initial one of which was held in Baghdad on Nov. 21 and 22, 1955. The organization's activities are directed by a permanent ministerial council, comprising the Iraqi foreign minister and the other member nations' ambassadors to Iraq; and its military activities are coordinated by the chiefs of staff of the five nations.

BAHAMAS. This British colony (area, 4,404 square miles), comprises about 700 islands or cays (of which 20 are inhabited), extending for some 760 miles southeastward from the Straits of Florida. It is considered geographically, though not politically, a part of the West Indies. The population was estimated on Dec. 31, 1954, at 92,598 (84,841, including 73,000 colored, according to the 1953 census). On New Providence Island (1953 pop., 46,125) is Nassau, the capital and chief port. Other principal islands, and their populations in 1953, are Andros (7,136), Eleuthera (6,070), Grand Bahama (4,095), Great Abaco (3,407), Cat Island (3,201), Exuma (2,919), and Acklins (1,273).

A leased naval and air base is maintained by the United States on Mayaguana, which is also one of the island substations of the Down Range guided missiles development project conducted jointly by Great Britain and the United States.

The administration is headed by a governor and commander in chief (Earl of Ranfurly, sworn in Dec. 21, 1953), who is assisted by an 8-member Executive Council, a 9-member nominated Legislative Council, and a 29-member elected House of Assembly. Revenue in 1954 was £3,095,541; expenditure, £3,008,064; estimated revenue in 1955, £3,314,500; expenditure, £3,177,345.

Primary education is free and compulsory. Government schools in 1954 numbered 130 (enrollment, 14,564), and denominational and private schools, 50 (enrollment, 6,402). Secondary education was provided by a government high school and 4 schools maintained by religious bodies. There is a teacher-training college at Oakes Field.

Paramount in the economy is the thriving tourist trade, which contributed earnings estimated at \$20 million from American visitors in 1954, when tourists numbered 109,605.

Total imports were valued in 1954 at £9,404,183; exports at £1,328,859 (in 1953 imports were valued at £8,812,564; exports at £1,390,284). Principal imports and their value in 1954 were pit props, £148,335; salt, £144,073; and tomatoes, £86,950. Exports included principally lumber, £327,687, and crawfish, £163,743, which the colony sends to the United States together with shells (novelty items), straw work, and okra. Corn products, vegetables, medicines,

electrical apparatus, cotton piece goods, and wearing apparel are imported from the United States.

There is radiotelegraph and radiotelephone communication between principal islands. The colony has no railways. Pan American Airways and British Overseas Airways operate daily services between Miami, Fla., and Nassau. The latter airway also provides service from New York, Jamaica, and Bermuda. Services are maintained by Trans-Canada Air Lines from Montreal and Toronto to Nassau. New Providence has 165 miles of public roads open to motor traffic. British currency is legal tender in the Bahamas, but United States and Canadian currencies are accepted. (See also BRITISH WEST INDIES.)

BAHRAIN. See ARABIA.

BALANCE OF PAYMENTS, U.S. See INTERNATIONAL TRADE.

BALEARIC ISLANDS (Span. *BALEARES*). An archipelago in the Mediterranean Sea east of Spain, of which the islands form a province. The four largest islands are Mallorca, Menorca, Ibiza, and Formentera. Total area, 1,936 square miles; pop. (1952), 424,707. Palma (138,100), the capital, is on Mallorca. Almonds, olives, figs, and other fruits are grown. Handicrafts include embroideries, laces, imitation jewelry, and pottery. Tourism is important.

BALKAN STATES. The states of the Balkan Peninsula, which comprises the region of Europe south of the Danube and Sava rivers between the Black Sea and the Adriatic Sea. Politically, the Balkan States include Yugoslavia, Albania, Greece, European Turkey, Bulgaria, and Rumania. (See separate articles on the Balkan countries, and the Index entry, *Balkan States*.)

BALLET. See DANCE.

BALTIC STATES. A term applied to Estonia, Latvia, and Lithuania, on the east coast of the Baltic Sea of northeastern Europe. The Baltic States were incorporated into the Soviet Union in 1940 as member republics. (See UNION OF SOVIET SOCIALIST REPUBLICS, and articles on each of the Baltic States.)

BALTIMORE. Maryland's dominant metropolis, Baltimore is the sixth most populous city in the United States. It has a land area of 78.7 square miles and in 1950 had a population of 949,708. It is the center of a rapidly growing metropolitan area which includes Baltimore and Anne Arundel counties, totaling 1,106 square miles and having a 1950 census of 1,337,373. Population estimates at mid-1955 were 968,500 for the city and 1,485,000 for the metropolitan area.

An excellent port and diversified manufacturing plants are the principal sources of Baltimore's economic strength. The port ranks second in the nation in foreign shipping tonnage. Leading industries in terms of value added by manufacture are transportation equipment, primary metals, foods and kindred products, and chemicals.

Nonagricultural workers in the metropolitan area totaled 562,800 in August 1955, of whom 196,500 were engaged in manufacturing. Department store sales index in 1954 (based on 1947-49 = 100) was 107.8. Investment in new plants and expansion in 1954 totaled \$99,765,000. Other data for Baltimore City proper: retail sales (1954): \$1,302,966,000 (50.2% of the state's total). Vessel arrivals (1954): 4,829. Tonnages shipped through port (1954): 4,124,811 export tons (\$495,200,000) and 14,951,276 import tons (\$462,000,000). Output of electricity in kilowatt-hours (1954): 3,932,291,000. Total sales of gas in cubic feet (1954): 20,945,361,500. Bank clearings (1954): \$15,521,949,512. Freight car loadings (1954): 274,675. Number of manufacturing plants (1954): 1,896. Public school enrollment

(September 1955): 148,180. Cost-of-living index in 1954 (based on 1947-49 = 100): 115.1.

The government of Baltimore City combines city and county functions. It is governed by a mayor and 21-member City Council elected for four-year terms. Additional elective officers include the comptroller and the council president. In the May 1955 elections, the mayoral incumbent, Thomas D'Alesandro, was elected to his third consecutive term. All other present elected city officeholders are Democrats.

In citywide referenda conducted at the May elections, voters approved four public works bond issues totaling \$19,500,000, of which the largest (\$15,000,000) was designated for school construction.

The city's 1955 budget called for expenditures totaling \$183,436,904, of which \$150,008,084 was for current expenditures. The 1955 real property tax was \$3.05 per \$100 on an assessed valuation of \$2,936,005,029. Net long term debt (1955) was \$230,038,060.

Problems of slum elimination, downtown blighted areas, and traffic congestion continued to plague government and business leaders in 1955. Early in the year a Greater Baltimore Committee was formed to bring organized civic interest to bear on these and other problems.

City law-enforcement officers launched an all-out antiracket campaign which included grand jury investigations, a reorganization of vice and racket units, and police crackdowns on organized crime in the city.

A Civic Center Authority was established to provide a modern metropolitan center suitable for indoor sports, expositions, contests, and conventions. (See also MARYLAND; TUNNELS.)

University of Maryland.*

BANDUNG CONFERENCE. See **ASIAN-AFRICAN CONFERENCE.**

BANK FOR INTERNATIONAL SETTLEMENTS. A review of the activities of the Bank for International Settlements during its financial year ended March 31, 1955, is contained in the 25th annual report, which was presented to the annual general meeting held at its offices in Basle, Switzerland, in June 1955, at which 21 European central banks were represented.

The total of the balance sheet of the BIS increased from 1,512 million gold francs (U.S.\$495 million) to 1,718 million gold francs (U.S.\$563 million) during the last financial year. The item "gold in bars and coins" in the balance sheet on March 31, 1955, stood at 626 million gold francs (U.S.\$205 million), an increase of 17 million gold francs (U.S.\$5.6 million) over the previous year's figure.

Total deposits at sight and at short-term rose from 1,230 million gold francs (equivalent to U.S.\$403 million) to 1,432 million gold francs (U.S.\$469 million) between April 1, 1954, and March 31, 1955, time funds accounting for practically the whole of this increase. The bank has consequently been in a better position to meet the demands of its central bank customers for short-term credits. These were for the most part in dollars or Swiss francs and were concluded for periods of three months, often with the possibility of renewal for a further period.

The bank has continued to be very active in operations for the purchase, sale, and exchange of gold, and in the latter case has been able to assist central banks to avoid physical transfers of

gold from one center to another.

Despite closely competitive conditions in most of the fields within which the BIS operates, a greatly increased turnover has enabled the bank to earn a surplus of 9.4 million gold francs (equivalent to U.S.\$3 million) during the period under review.

The bank cooperates with the International Bank for Reconstruction and Development and the International Monetary Fund (q.q.v.) and maintains close relations with the Federal Reserve System (q.v.) in the United States. Its principal funds in the United States are held at the Federal Reserve Bank of New York, where the BIS enjoys the same facilities as foreign central banks. The BIS has continued to act as agent for the Organization for European Economic Cooperation (the OEEC) for the technical operation of the Agreement for the Establishment of a European Payments Union (the EPU), which, in principle, was prolonged to June 1956. The BIS is also to assume similar agency functions under the European Monetary Agreement of August 5, 1955, when this agreement becomes applicable upon termination of the EPU.

On November 28, 1954, the bank assumed the functions of depository, under the terms of an indenture concluded with the High Authority of the European Coal and Steel Community, in connection with loans raised by the High Authority to finance development within the community. These loans include one for \$100 million advanced by the Export-Import Bank of Washington on behalf of the United States government. Other loans have also been made to the High Authority by institutions in countries which are members of the community. The bank has continued to exercise its functions as trustee for the German Young Loan (1930) and the Austrian Government International Loan (1930), and as fiscal agent for the German Dawes Loan (1924).

ROGER AUBOIN,

General Manager, Alternate of the President.

BANKS AND BANKING. United States Banking System.—Banking in the United States and its territories in 1955 was carried on in 20,981 banking offices, of which 14,367 are head offices and 6,614 are branches. The banks are members of a dual system, of which 4,789 are federally chartered and the rest state-chartered and supervised commercial banks, mutual savings banks, trust companies, and private banks.

Total banking resources on June 30, 1955, were \$228,970,000,000, an advance of almost \$10 billion above 1954, and aggregate resources were divided almost equally between the federally and state-chartered institutions.

There was a decline in the number of unit banks, reflecting a trend toward concentration of business in larger, diversified, and more self-sufficient corporations. Banks, being the principal suppliers of production and short-term credit to industry, but being limited in the amount they can loan to any one borrower, have been merging, consolidating, and acquiring other banks in order to improve their credit capacity and competitive position. Proponents of unit banking and some members of Congress contend that concentration of financial power in larger banks may stifle competition. Proposals have been made to require banks to obtain permission from some central authority in cases where they propose to merge, consolidate, or acquire another bank through stock purchase. Other banking leaders

oppose placing the authority to approve bank mergers in a central agency, such as the Federal Reserve System or the Federal Deposit Insurance Corporation (q.v.) as a serious invasion of states' rights. There is general agreement as to the need for banks to have a larger loan capacity to serve business. There has been no final disposition of the problem.

(Source: Federal Reserve System.)

General Economic Conditions.—The year 1955 was marked as one of record-breaking prosperity, with employment and personal income advancing and the gross national product estimated at a new high annual rate of \$384 billion through the first nine months.

Disturbing elements in the situation were the slowing down of the rate of savings and accumulation of cash reserves by individuals and business. Public and private debt increased \$7.2 billion during the first half of the year, with bank loans to business accounting for about \$2 billion of the total. Mortgage debt advanced at an annual rate of \$15 billion during the second quarter, and consumer loans expanded at an increasing rate, approximating \$765 million during the month of June. The 1955 credit-supported inflation provides a striking example of the conflict in credit policy based on political considerations devoted to maintaining a "full employment economy," made possible by flexible, easy credit and low interest, and a policy based on the working of traditional economic forces.

Credit Operations.—At the beginning of 1955, mortgage loans were guaranteed by the Veterans Administration with no down payments required and terms up to 30 years. The Federal Housing Administration was insuring loans for nonveterans with provision for down payments as low as 5% and terms of up to 30 years. A record volume of home building was generated in response to these terms; and in the first half of 1955, two out of every five loans guaranteed by the Veterans Administration were made with no down payment. Easy credit was also encouraged by the Small Business Administration, government-sponsored agricultural agencies, and other government agencies, and was reflected in the operations of many private financial institutions.

In June 1955, installment buying of automo-

biles climbed \$567 million, compared with \$166 million in June 1954. Automobile paper outstanding at the end of June totaled \$12.6 billion, compared with the previous high of \$10.4 billion in November 1953. Total consumer credit, including installment and single-payment loans, aggregated \$32.5 billion on June 30. The June increase was \$903 million.

The high prices established in the stock markets, which are a measure of business and economic activity, were among other business indicators which had been causing concern for government officials and bankers.

In August, the government, through the Federal Reserve System, took steps to slow down the inflationary pressures by tightening credit. Conferences were held with representatives of all private credit-granting businesses to discuss a voluntary program of credit restraint. The Federal Reserve System put into effect moderate increases in rediscount rates and raised the reserve requirements for member banks. Margins on stocks were increased in June to 70%, and interest rates to brokers were up to 3½% in early August. The prime rate on business loans was advanced from 3% to 3¼%, the first increase since April 1953.

Restrictive measures were also applied in the home mortgage field by the Federal Housing Administration. After August 1, all home mortgage loans for nonveterans, eligible for FHA insurance, required a down payment of 7% on the first \$9,000 and 27% on the assessed evaluation over \$9,000. Mortgage loans to veterans required a down payment of 2%. Terms on all home mortgages were cut from 30 to 25 years.

Other means of credit restraint were also adopted by the Federal Reserve System with the cooperation of the financial community. These included open-market operations which, coupled with raised rediscount rates and reserve requirements, reduced the capacity of banks to make loans.

The sum total of the restrictive effect on credit by these measures will be more psychological than actual with respect to borrowing by individuals and business firms which have a legitimate and constructive use for credit. It may be several months before shrinking in loan volume takes place, due to the forward commitments for plant expansion and construction programs just getting under way. (See also CONSUMER CREDIT; FEDERAL RESERVE SYSTEM; HOUSING; SAVINGS; STOCKS AND BONDS.)

Miscellaneous Banking Developments.—Among the notable developments during the year were advances made by banks in the application of electronic and electrical devices to bank operations. Committees of bankers, representing the American Bankers Association, have written and distributed to equipment manufacturers a performance specification for check-handling and record-keeping devices.

Banks have also increased their educational activities, particularly with a view to providing for successor management. There are more than 100 schools of banking in the country. Some are schools of advanced study, such as The Graduate School of Banking conducted by the American Bankers Association at Rutgers University. The American Institute of Banking has also expanded its graduate courses aimed at training for bank management.

BANKING IN CANADA

Canada is served by a commercial branch banking system, as distinguished from the unit

banking system of the United States. There are 10 chartered commercial banks* with approximately 3,900 branch offices serving every part of the country. The Bank of Canada is the central bank, now owned by the government.

Total assets of Canadian banks on June 30, 1955, amounted to \$12,125,000,000, compared with \$10,731,000,000 on June 30, 1954; personal savings advanced to \$5,573,000,000 against \$5,109,000,000 the previous year; and demand deposits were \$3,665,000,000 against \$3,235,000,000 in 1954. (All figures in this paragraph represent Canadian dollars.) Bank loans totaled \$5,281,000,000, compared with \$4,837,000,000 the previous year; holdings of government securities advanced to \$3,620,000,000—over \$2,793,000,000 in 1954; other securities stood at \$942,000,000, compared with \$745,000,000; and mortgage investments of banks, a new field, amounted to \$145,000,000. (See also CANADA—*The Canadian Economy*.)

WORLD FINANCIAL AND ECONOMIC CONDITIONS

Most countries of the world applied credit restraints and other anti-inflationary measures in their economies much earlier than did the United States. In Japan, Switzerland, Turkey, New Zealand, and West Germany, bank interest rates were increased in July and August 1955; Pakistan devaluated the rupee to 21 cents in United States currency; and other countries took action to strengthen internal and foreign trade positions.

As the threat of World War III moved further away during 1955, the general world financial outlook improved. The year was marked with intense competition for international markets among West Germany, Great Britain, the Benelux countries, and Japan.

In 1955, Mexico was enjoying economic prosperity as a result of good crops, improvements in markets for minerals, and increased export trade. Japan, with exports 30% higher, was again a factor in world markets, and repealed preferential tax treatment for foreign businesses, with the result that many American firms may be forced to cease operations.

During 1955 the countries of the world moved closer to free convertibility of monetary units. The two world currencies are the United States dollar and the British trade account pound sterling; and many authorities believe that there is little difference between full interconvertibility of these currencies and the situation that currently exists.

Great Britain.—Great Britain was adversely affected by prolonged strikes and lack of price stability, due to the threat of rising prices. Despite these dislocations, however, the value of imports was at a high level, totaling £3.6 million more in June than in March. However, exports were down £165.1 million. Although the visible trade deficit was only £129 million, exports continued to increase in the first half of 1955 and were about 3½% higher for these six months than for the same period of 1954.

Interest costs, higher wages, and more expen-

sive transportation are the major problems of basic industries in competition for world markets. Britain has experienced a credit-supported consumer buying spree similar to that in the United States. In mid-August, the Bank of England initiated controls similar to Regulation W which governed consumer lending in the United States during World War II.

Scandinavia.—Scandinavia revived policies of general monetary control, to combat inflation, and freed the business and the financial communities from certain specific regulations. These developments were of interest because Norway, Sweden, and Denmark have relied more on central planning and selective measures than have other nations, in an effort to maintain social-welfare economies.

Following World War II, the Scandinavian countries adhered to a policy of low interest rates, subsidies for housing and industrial construction, and other selective measures. As world demand for goods and services increased during the Korean War, inflationary pressures were strong, followed by a period of business depression. During 1955, the governments of Norway, Sweden, and Denmark reversed their position, allowing interest rates to increase to as much as 5½%; cutting housing subsidies sharply and permitting rentals to increase; increasing bank reserve requirements; and placing taxes on imports, particularly automobiles. The governments also floated loans to reduce purchasing power. These measures, which appear to be effective, are of great long-range importance in preparing Scandinavian currencies for interconvertibility and in maintaining the world competitive position of their export industries.

American Bankers Association.

BAPTIST CHURCHES. According to the *Yearbook of American Churches* (1955 edition), the 27 Baptist bodies into which the autonomous Baptist congregations of the United States have been grouped reported a total membership of 18,448,621 in 1954 (not including membership figures unavailable for one group). Baptists continue to comprise the largest single communion, and represent over one third of all Protestants in the country.

Of the 27 Baptist bodies, the Southern Baptist Convention (see below) is the largest. The National Baptist Convention, U.S.A., Inc., a Negro affiliate, ranks second, with 4,557,416 members reported. Ranking third is the National Baptist Convention of America, an "unincorporated" Negro denomination, with 2,608,974; and fourth, the American Baptist Convention (see below). (Membership figures for 1954 of other large Baptist bodies are given in the article CHURCH MEMBERSHIP, U.S.)

SOUTHERN BAPTIST CONVENTION

Organized in Augusta, Ga., in 1845, this largest of the Baptist bodies reported 29,899 churches in 1954 with a membership of 8,169,491 in 25 states and 1,032 district associations.

The 70 Southern Baptist educational institutions reported 52,314 students in 1954-55, with 5,639 students in the five seminaries located at Louisville, Ky., New Orleans, La., Fort Worth, Texas, Berkeley, Calif., and Wake Forest, N.C. There were 143 students in the American Bap-

* The number of chartered banks has been reduced from 11 to 10 as a result of the amalgamation of the Bank of Toronto and the Dominion Bank in November 1954, and will be further reduced to 9 when the proposed merger (Oct. 12, 1955) of the Imperial Bank of Canada and Barclays Bank (Canada) is completed in 1956. The 7 other chartered banks are as follows: Royal Bank of Canada, Bank of Montreal, Bank of Nova Scotia, Provincial Bank of Canada, Canadian Bank of Commerce, Banque Canadienne Nationale, and Mercantile Bank of Canada.

tist Theological Seminary for Negroes located at Nashville, Tenn. The educational institutions reported endowments of \$52,808,162 and property valued at \$127,663,216. The 33 Baptist hospitals reported property valued at \$80,232,825, and 532,947 patients during 1954. The 24 orphanages reported 5,588 children, and property valued at \$21,218,366. The denomination supports 1,010 foreign missionaries and 1,324 home missionaries. Gifts amounted to \$38.13 per capita in 1954, with \$7.39 per capita going to missions and benevolences. The Relief and Annuity Board reported 39,415 active members, with assets totaling \$35,091,515.

The publishing division of the convention is the Baptist Sunday School Board, located in Nashville, Tenn. In 1954 it distributed 59,644,633 periodicals and published 3,109,730 books. Dr. C. C. Warren of Charlotte, N.C., was elected president at the 1955 convention held in Miami, Fla. The office of the Southern Baptist Convention Executive Committee is located at 127 Ninth Avenue, North, Nashville 3, Tenn.

Southern Baptist Convention.*

AMERICAN BAPTIST CONVENTION

The American Baptist Convention, formerly known as the Northern Baptist Convention, received its name in 1950, thus securing a uniformity of nomenclature with national societies such as the American Baptist Foreign Mission Society and the American Baptist Home Mission Society, which cooperate with the convention and participate in its organization.

In 1955 the convention, representing the cooperative interests of 6,490 churches in 34 northern and western states, had a total membership of 1,513,697. Its program of missionary and benevolent work is carried on in the United States, Africa, Asia, Europe, and several Latin American countries by 7 national societies and boards, 33 state conventions, and 15 city societies. It is supported by contributions from churches to a unified budget, representing the interests of all agencies. Because of a change now being effected in the fiscal year, the unified budget for 1955 covers only an eight-month period from May to December inclusive, totaling \$5,161,927. The approved budget for the full year 1956 amounts to \$7,997,338. The raising of the budget is under the supervision of the Council on Missionary Cooperation, of which Rev. Ralph M. Johnson is general director. The convention is affiliated with the Baptist World Alliance, the National Council of Churches of Christ in U.S.A., and the World Council of Churches.

In 1955, at Atlantic City, N.J., Frank A. Nelson of Racine, Wis., was elected president of the convention for 1955-56.

REUBEN E. NELSON,
General Secretary, American Baptist Convention.

BARA, Theda (real name THEODOSIA GOODMAN), American actress: b. Cincinnati, Ohio, 1890; d. Los Angeles, Calif., April 7, 1955. The prototype of the seductive "vamp" in motion pictures, Miss Bara strongly influenced the feminine fashions of her day and provided a definite impetus to the film industry during her brief career.

Cast as a sinuous temptress in her first motion picture, *A Fool There Was* (1915), she became an immediate box-office "hit." The film industry, capitalizing on her success, launched a publicity campaign of fantastic proportions to create the Bara myth which was to carry her

through four and a half years of undisputed queenship in films. Purported to have been born in the Sahara Desert, daughter of a French artist and an Arabian princess, she was publicized as a modern Circe whose name Theda was an anagram for the word death, and Bara, a reversed spelling of Arab. Theda was actually, however, a contraction of Theodosia, and Bara was the family name of her maternal grandfather, François Bara de Coppet, a Swiss national.

Miss Bara appeared in 40 films from 1915 to 1920, mostly under the aegis of William Fox. These included *The Vampire*, *Madame Du Barry*, *Cleopatra*, *Salome*, *Camille*, *The Vixen*, and *The She Devil*. Each role, to the increasing delight of the public and to the indignation of the clergy, enhanced the box-office attraction of the sultry-eyed vampire. Nevertheless, in 1920 she forced her producer to let her appear in the less spectacular *Kathleen Mavourneen*. In the same year she also attempted her Broadway stage debut in *The Blue Flame*, which, although a personal success, was an artistic failure. Following this role came the disclosure of Miss Bara's very normal American upbringing, her retirement from films, and her marriage to her director, Charles J. Brabin, in 1921.

BARBADOS. This self-governing British colony (area, 166 square miles) lies 102 miles east of St. Vincent (Windward Islands) in the West Indies; its population (222,942, in 1953, of which about 93% were Negro) averages 1,250 persons to the square mile, thus being second in density only to Bermuda in the Western Hemisphere. The capital is Bridgetown (est. pop., 18,000) on Carlisle Bay, in the southwestern part of the island.

The governor (Brig. Sir Robert D. H. Arundell, appointed May 14, 1953) is assisted by an Executive Council, a 15-member nominated Legislative Council, and a 24-member House of Assembly, elected triennially. The prime minister, Grantley Adams, made a goodwill visit to the United States in April 1955. An Executive Committee supervises the general policy of government departments. The plan for a British Caribbean Federation has been ratified by the House of Assembly.

The British West Indian dollar (equals U.S.\$0.5833) is the currency unit. In 1954-55 estimated revenue was BWI\$13,672,184; expenditure, BWI\$12,912,425. The British government has approved in principle the construction of a deep-water harbor for Barbados. In 1953-54 there were 124 primary schools (31,696 pupils); and 10 grant-aided secondary schools (3,115 pupils); the government expended BWI\$2,307,377 on education.

Barbados depends financially on its production of sugar. Benefiting from the recently inaugurated government irrigation project, an above-average crop of 178,960 long tons was harvested in 1954, including the equivalent of 4,130,569 wine gallons of fancy molasses. Some 46,253 acres were under sugarcane. Other industry includes light manufactures. Fish canneries handle the catch of about 600 boats, and the government is helping in the conversion of the fishing fleet to motor power.

Imports (principally of foodstuffs, clothing, and metal manufactures) during the first half of 1954 were valued at BWI\$23,643,700, compared with BWI\$21,252,500 in 1953. Great Britain was the chief supplier. The total value of domestic exports for the first half of 1954 was BWI\$24,-

676,100, compared with BWI\$20,340,100 in the same period in 1953.

Highways total 623 miles of bituminous-surfaced roads. Barbados is served by British West Indian Airways and Trans-Canada Air Lines. (See also **BRITISH WEST INDIES**.)

BASEBALL. See **SPORTS, GAMES, AND SHOWS**.

BASKETBALL. See **SPORTS, GAMES, AND SHOWS**.

BASUTOLAND. Bounded by the Orange Free State, Natal, and Cape Provinces of the Union of South Africa, but not part of the Union, Basutoland (area, 11,716 square miles) constitutes one of three British-administered High Commission Territories—the others being Bechuanaland Protectorate and Swaziland (q.v.). The estimated population was 583,000 in mid-1953 (at the 1946 census, 563,845, comprising 561,298 natives, 1,689 whites, 602 mixed races, and 274 Indians). The capital is Maseru (pop., 3,432), where an appeals court was established May 1, 1955, for the three High Commission Territories. Much of the male population provides migrant labor for the South African mines.

The high commissioner (Sir Percival Liesching, assumed office, 1955) is represented in Basutoland by a resident commissioner (E. P. Arrowsmith, appointed 1952). A paramount chief (since 1941, Bereng, a minor; Ma'Ntsebo, senior widow of Chief Seeiso Griffith, is regent) has executive and judicial authority. A 99-member native advisory council elects 5 of its members as a standing advisory committee. In 1953–54 revenue was £1,513,606, including colonial development and welfare grants; expenditure, £1,406,410. Estimated revenue and expenditure for 1954–55 were £1,228,911 and £1,262,617, respectively. Educational expenditure from territorial revenues was £188,076 in 1953–54. There were 835 aided and partially-aided schools (14 secondary, teacher-training, and technical institutions; 68 intermediate schools; 746 elementary vernacular schools). In addition there were 116 unaided private schools. Pupil enrollment was 103,332 in 1954.

Large acreages of corn, wheat, and other subsistence crops are planted. Livestock in 1953 included 406,454 cattle, 92,884 horses, 53,543 donkeys, 1,303,325 sheep, and 550,612 goats. Exports in 1954 totaled £1,930,486, including £916,122 to the United Kingdom; imports, £2,612,007, including £164,967 from the United Kingdom. A spur rail line (16 miles) links Maseru with Marseilles, Orange Free State. A new road into the mountainous hinterland is nearing completion.

BAUXITE. United States production of bauxite on a dried equivalent basis reached a peak of 2,005,927 long tons in 1954, compared with 1,579,739 tons in 1953, according to figures compiled by the U.S. Bureau of Mines. Production during the first half of 1955 reached 975,739 long tons. Imports reached a peak of 5,291,862 long tons in 1954, but a total of 2,429,990 tons for the first half of 1955 indicated a downward trend. Although nearly three fourths of the domestic supply originated in foreign countries, the strategic situation is favorable because the major sources of supply are relatively close as indicated by the following tonnages imported in 1954: Surinam, 3,129,611 tons; Jamaica, 1,987,759 tons; and British Guiana, 174,492 tons. (See **MINERAL PRODUCTION** for output of major producing countries.)

BEANS. See **VEGETABLES**.

BECHUANALAND PROTECTORATE. Bordered by South West Africa, Southern Rhodesia, and the Transvaal Province, and extending between the Molopo and Zambezi rivers, the Bechuanaland Protectorate is the largest of the three British-administered High Commission Territories in South Africa, the others being Basutoland and Swaziland (q.v.); area, about 275,000 square miles. The population, estimated in 1954 at 300,000, was 296,883 at the 1946 census, then comprising 292,754 Africans, 2,325 Europeans, and 1,804 Asians.

The protectorate is administered from Mafeking, Union of South Africa, by a resident commissioner (W. F. Mackenzie). Local rule remains in the hands of African chiefs, heading 8 tribal administrations, of which the Bamangwato (pop., 100,987; capital, Serowe) is the largest. Revenue in 1953–54 totaled £908,255; expenditure, £891,700. British Treasury grants are being used for educational, medical, agricultural, and other development work. Schools in 1954 numbered 162 (African, 148; mixed races, 5; whites, 9). African schools are controlled by tribal committees, which include mission representatives. Supplementing missionary expenditures in 1953–54, a total of £84,085 was spent on education, including £38,835 from native treasuries.

The economy is almost entirely pastoral. Surplus harvests permitted exportation in 1954 of sorghum and millet (83,793 bags, valued at £124,750), against grain importations (chiefly wheat) totaling 32,098 bags (200 pounds each). Minerals worked in the Tati district in 1954 included gold, 1,216 ounces; silver, 292 ounces; and cyanite, 2,054 tons. Asbestos mining in the Bangwaketse Reserve produced 885 tons in 1954. Exports in 1954 were valued at £2,423,683 (cattle, £1,562,067; hides, skins, and karosses, £101,709; sheep and goats, £60,312); imports, £2,053,423.

The government-owned Southern Rhodesia Railways operates on a single track (394 miles) from Ramathlabama to Ramaquabane. There are 1,500 miles of roads (main roads, 550). Airfields are located at Gaberones, Mahalapye, Francistown, Serowe, and Maun, and landing grounds and emergency strips at 10 smaller places. The Union of South Africa operates 9 post offices and 39 postal agencies in the territory.

BELGIAN CONGO. A Belgian colony in equatorial Africa. Area, 904,991 square miles; pop. (est. mid-1954), 12,250,000, including (as of Dec. 31, 1953) 86,688 Europeans, mostly Belgians. Chief cities and populations (1953): Léopoldville, 257,197; Elisabethville, 117,879; Jadotville, 55,960; and Matadi, 48,351.

The People.—The natives are mainly Bantu and Sudanese tribesmen, with some Nilotics, Pygmies, and Hamites. About 2.6 million natives live outside the tribal areas and are subject to restrictions on movement and on holding of landed property. Several thousand *evolus* hold good-behavior cards which permit a greater degree of freedom. A few hundred natives have been "matriculated," a legal process involving renunciation of tribal ties to assume equal status with whites. Indigenous wage workers numbered 1,146,284 at the end of 1954. Some 120,000 native families had been settled on government-sponsored *payssannat* farm communities by 1954.

Government.—The Belgian governor general is responsible to the minister for the colonies at Brussels, but has unrestricted powers in the Congo. He is aided by a vice governor, a consultative council, and a provincial governor in each of the 6 provinces. There is no legis-

BELGIUM

lature or election of officials, Native chiefs and tribunals, under Belgian supervision, administer customary law on a local scale.

Education and Religion.—Nearly half the native school-age population attends school. At the end of 1953 there were 24,579 schools (mostly conducted by missions) with 1,053,119 native pupils. There are several hundred secondary, vocational, teacher-training, and other specialized schools. The University of Louvain, a Catholic institution, had 29 Africans and 4 Europeans enrolled in 1955, when its buildings were nearing completion. Roman Catholic missionaries numbered 5,937 in 1953; Protestants, 2,260.

Finance.—In the ordinary budget for 1954, revenue was estimated at 7,879,951,000 francs; expenditure, 7,534,844,000. Public investment under the 10-year development plan (1950-59) was 6.2 billion francs in 1954; by mid-1954, a total of 18.2 billion of the projected 48 billion had actually been spent. The Belgian Congo franc equals U.S. \$0.02.

Production.—The colony's vast mineral wealth is exploited by a few giant enterprises. Output of chief minerals in 1954 was (in metric tons): copper, 223,750; cobalt metal, 8,609; zinc concentrates, 150,331; electrolytic zinc, 32,000; cassiterite, 18,350; and manganese ore, 384,937. Gold output totaled 11,215 kilograms; industrial diamonds, 12,092,377 carats; and other diamonds, 527,721 carats. Other minerals include tantalum-columbite, cadmium, wolframite, silver, and coal. The Belgian Congo is also a major source of uranium and other strategic minerals. Industries are chiefly processed foods, construction materials, chemicals, soap, textiles, leather, footwear, glassware, and other light items. Industrial output quadrupled in volume between 1945 and 1953, and provided about 6% of the 1953 national income of 43,160 million francs. Hydroelectric generating capacity rose from 96,500 kw. in 1949, to 275,000 at the end of 1953.

Chief subsistence crops are cassava, corn, rice, sorghum, peanuts, sweet potatoes, and bananas. Principal cash crops and 1954 output in metric tons were: palm oil, 195,245; palm kernels, 118,918; coffee, 28,422; rubber, 25,004; and cacao, 2,643. Cotton production for 1954-55 (prelim.) was 240,000 bales. Forest products include hardwoods, cinchona bark, ivory, derris, skins, and pyrethrum.

Foreign Trade.—Exports from the Belgian Congo and Ruanda-Urundi in 1954 (exclusive of uranium and other strategic ores for which data are not published) totaled 20,224,665,000 francs; imports, 18,492,605,000. Minerals constituted 62% of exports by value; agricultural products, 35%. Chief exports, with values in millions of francs, included: copper, 6,884; cobalt products, 2,065; coffee, 1,935; cotton, 1,524; palm oil, 1,256; and tin ores, 1,035. Imports are mainly textiles, foodstuffs, petroleum products, machinery, and transport equipment. Belgium-Luxembourg took 40% of 1954 exports and provided 37% of imports. Much of the Congo's exports to Belgium are directly transhipped to the United States.

Transportation and Communications.—The Belgian Congo had 76,461 miles of roads (including 19,742 of main roads) and 2,996 miles of public railways at the beginning of 1954. There are 5 major airports and numerous smaller ones. Registered motor vehicles in 1955 included 24,015 passenger cars and 22,777 trucks. Telephone subscribers numbered 11,015 in 1953. In 1955 there were 8 daily newspapers, all in French.

Principal Events, 1955.—King Baudouin I arrived in Léopoldville on May 16 on a 27-day, 3,500-mile tour of the Belgian Congo and Ruanda-Urundi. The young king's visit, the first by a Belgian monarch since 1928, highlighted the considerable economic and social progress

that has taken place in the colony in recent years. On July 31 the \$14 million Tshopo hydroelectric plant was inaugurated at Stanleyville. It was the first of four such plants projected under the 10-year development plan. Another major plant at Zongo Falls, outside Léopoldville, was inaugurated on October 23. A decree signed by King Baudouin on November 8 provided for the establishment of a university at Elisabethville, to be open to both native and European students.

BELGIUM. A constitutional monarchy on the northwest coast of Europe. Area, 11,779 square miles; pop. (est. Dec. 31, 1954), 8,841,000. Chief cities and populations (Dec. 31, 1953): Brussels, the capital (with suburbs), 972,629; Antwerp, 257,634; Ghent, 164,260; and Liège, 155,900. Both French and Flemish are official languages. French is spoken chiefly by the Walloons of the south; Flemish in the north. About two thirds of the population is urban. The birth rate in 1954 was 16.7; the death rate, 11.9; and the infant mortality rate, 49.1. The average life expectancy at birth for the years 1946-49 was 62.0 for males and 67.3 for females.

Government.—King Baudouin I (b. 1930) acceded to the throne on July 17, 1951. The Belgian Parliament is elected for a 4-year term. The Chamber of Deputies (212 members) is elected directly by the people. Of the Senate's 175 members, 106 are elected by the people, 46 by provincial councils, and 23 by Parliament itself. Following the elections of April 11, 1954, seating in the Chamber of Deputies was: Social Christians, 95; Socialists, 86; Liberals, 25; Communists, 4; and independents, 2. Premier Achille Van Acker heads a Socialist-Liberal coalition cabinet formed in April 1954.

Education.—Elementary schools in 1953 included 8,745 primary schools (826,328 pupils), and 4,223 infant schools (324,119). On the secondary level there were 499 free higher-grade schools (78,475 pupils), 158 *écoles moyennes*, 88 royal atheneums, 21 royal *lycées*, and other institutions. Chief institutions of higher education are the universities at Brussels (3,228 students in 1953-54), Ghent (3,075), Louvain (8,381), and Liège (3,195).

Religion.—A majority of the population is Roman Catholic. There are small Protestant and Jewish minorities. Religious freedom exists.

Finance.—Budget estimates for 1954 were: receipts, 80,943 million francs; expenditure, 96,732 million. Twenty-one billion francs was budgeted for defense in 1954. The Belgian franc is equal to U.S. \$0.02.

Production.—Manufacturing, especially heavy industry, and coal mining predominate in the Belgian economy. In 1954, industrial output recovered from the recession of 1952-53, the index of industrial production (base: 1949 = 100) rising to 122, from 114 in 1953. Output of crude steel in 1954 was 5,009,000 metric tons (a rise of 13% over 1953); pig iron and ferroalloys, 4,619,000 (up 10%); coal, 29,429,000 (down 3%); and electricity, 880 million kw.-hr. monthly (up 8%). Cotton yarn production totaled 112,560 metric tons (a rise of 12.5% over 1953), and woven cotton fabrics, 77,040 (up 16%). Other important Belgian industries are metal manufactures, chemicals, construction materials, paper, nonferrous metals, leather, ceramics, foodstuffs, tobacco products, diamond-setting, and footwear. National income in 1954 was estimated at 330.3 billion francs (314.4 billion in 1953).

Chief agricultural yields in 1954 were (in thousands of bushels): wheat, 20,800; rye, 9,000; barley, 10,550; oats, 30,200; and flaxseed, 719. Other important farm products are potatoes (1,569,093 metric tons in 1953), sugar beets, fodder beets, and meat and dairy products. Belgium depends on imports to meet most of her requirements for food and agricultural raw materials.

Foreign Trade.—Exports of the Belgium-Luxembourg Economic Union in 1954 totaled 115

billion francs; imports, 126.7 billion. Exports are chiefly metals and metallurgical products, textiles, mineral products, chemicals, and other manufactures; imports: industrial raw materials, fuels, grains and other foodstuffs, and machinery and vehicles. The Netherlands purchased 21% of 1954 exports; Germany, 10%; and France, 10%. Germany provided 14% of imports; the Netherlands, 13%; and France, 12%.

Transportation and Communications.—The length of railways in 1953 totaled 5,681 miles (standard and meter-gauge track). The highway network included 13,676 miles of state, provincial, and main local roads. The merchant fleet in 1953 aggregated 483,000 gross registered tons. Sabena, the national airline, operates services in western Europe, North America, Africa, and the Middle East. Passenger cars numbered 418,000 in 1954; radio sets, 1,863,000 (1953); telephones, 743,988 (1952); television sets, 15,000 (March 1954). Daily newspapers in 1952 numbered 39, with a total circulation of about 3,343,000.

Principal Events, 1955.—The major issue in Belgian public life during 1955 involved the government's effort to reduce the number and influence of the nation's Roman Catholic schools. The ensuing controversy, the most bitter since the 1950 furore over the return of former King Leopold III, sharply divided the country during the year.

The Socialist-Liberal coalition government of Premier Achille Van Acker, charging that the Catholic schools had been unduly favored under the previous Social Christian governments, introduced a measure into Parliament on May 17 to reduce the government subsidy to Catholic schools from the equivalent of \$74 million in 1954 to \$64 million in 1955. The bill also called for the government to establish and maintain more nondenominational schools and to equalize teachers' standards and conditions as between the two types of schools. (About 930,000 children attend Catholic schools, as compared with 720,000 in nondenominational schools.)

The government proposal was sharply fought by the Social Christian Party and by Catholics throughout the country. On March 26, over a hundred thousand Catholics, largely students, demonstrated in Brussels against the measure, despite a government ban. Tension was high in the capital and several minor clashes took place between demonstrators and police. On March 28, Catholics clashed with Socialist groups at Tongeren and Mons, and a state school was set afire at Couillet. Demonstrations and street fighting took place in Antwerp on April 17, and in Liège on July 2. Another mass protest involving some 150,000 persons took place in Brussels on July 10, although the tension and clashes which had marked the March 26 occurrence were absent. Meanwhile the Chamber of Deputies had passed the bill on June 13 by a vote of 111-1, after the Social Christian deputies had walked out. On July 21 the Senate passed the measure, 91-0, after a similar walkout.

The principal development in the field of foreign affairs was the ratification by Parliament of the 1954 Paris agreements on German rearmament and the expansion of the Western European Union. The Chamber of Deputies voted its approval on January 20, by 181-9 (with 2 abstentions), and the Senate voted its accord on April 6, by 142-2 (with one abstention).

In the economic sphere, the recovery of 1954 developed into a moderate prosperity in 1955, based on strong demand for iron and steel prod-

ucts, metallurgical goods, and coal. Some industries, however, such as textiles and leather, showed weaknesses in the face of foreign competition. Unemployment in the second quarter of 1955 was the lowest in seven years, the June total amounting to 137,000, as compared with 207,000 in June 1954. In the first eight months of 1955, exports were some 20% over those of the like period of 1954. Following the announcement in December 1954 of a \$50 million loan by the International Bank for Reconstruction and Development for the modernization of Belgian internal waterways and the port of Antwerp, the Netherlands Bank on March 11, 1955, announced a loan of 100 million guilders to the Belgian government.

M. J. G.

BENELUX ECONOMIC UNION. A projected union of the economies of Belgium, the Netherlands, and Luxembourg. Major decisions are made by a Benelux ministers committee, subject to ratification by the respective parliaments. Beginning in 1948, steps toward union included adoption of a uniform tariff system on goods from the outside, elimination of tariffs on many goods traded between members, and reduction of tax differences. A common trade and payments policy toward other nations was inaugurated on March 1, 1954, and capital movement between member nations was considerably liberalized beginning July 16, 1954. However, full economic union, originally set for 1950, has not been attained mainly because of differences in wage levels and agricultural costs between Belgium and the Netherlands. At a conference of Benelux ministers held at Brussels on May 3, 1955, it was agreed that agricultural policies of member nations would be coordinated within a period of seven years (1955-62) to permit free exchange of farm products.

BENSON, Ezra Taft, U.S. secretary of agriculture: b. Whitney, Idaho, Aug. 4, 1889. After an extensive career in agriculture as a farm manager at Whitney (1923-29), as an economics and marketing specialist for the University of Idaho (1930-38), and as executive secretary for the National Council of Farmer Cooperatives (1939-44), Ezra Benson took office as U.S. secretary of agriculture on Jan. 21, 1953.

One of the more controversial figures in the Eisenhower administration, Benson has forthrightly held the view that the American farmer does not wish to be dependent on the federal government. He has consistently advocated the program of flexible (75%-90% of parity) price supports which was enacted in the Agricultural Act of 1954. Faced in 1955 with a continuing decline in farm prices (4% to 5% from 1954 levels), Benson offered proposals, which President Eisenhower submitted to Congress on April 27, for improving economic and social conditions for the nation's 1.5-million low-income farm families.

A major controversy in which Benson became involved in 1955 was the case of Wolf I. Ladejinsky, land-reform expert, whom the Department of Agriculture had suspended as a security risk in December 1954, and who was hired by the Foreign Operations Administration on Jan. 5, 1955. Benson publicly admitted on September 27 that his department had erred in originally firing Ladejinsky as a security risk.

BERLIN. See GERMANY.

BERMUDA. This British colony in the Atlantic Ocean, lying 580 miles east-southeast of Cape

Hatteras, North Carolina, comprises some 300 small islands, of which about 20 are inhabited, notably Main Island (on which is Hamilton, the capital), St. George's, St. David's, Somerset, and Ireland. The total land area is 20.58 square miles; the civilian population of 40,445 (1954 est.) includes 25,047 colored. Strategically important, Bermuda is the base of the American and West Indies Squadron. Since 1941, 2.83 square miles have been used under a 99-year lease for the operation of United States naval and air bases, on Tucker and Morgan, and St. David's and Longbird islands, respectively. The British garrison was withdrawn on April 25, 1953, after an occupancy of 156 years, but was restored on March 1, 1954. The Bermuda Rifles and the Bermuda Militia are recruited locally.

A governor appointed by the crown (Lieut. Gen. Sir John Woodall, assumed office in 1955) is assisted by a 7-member Executive Council (including 4 nonofficials), an 11-member Legislative Council (including 8 nominated nonofficials), and a House of Assembly (the oldest British colonial parliament) of 36 elected members. Revenue in 1954 was £2,976,251; expenditure, £3,389,381. Expenditure on education totaled £405,049 in 1954. There were 46 schools in 1954 (8,770 pupils), including 35 primary (government, 19; state-aided 1; private, 15); and 11 secondary (state-aided, 8; private, 3). The colony's healthful subtropical climate and beautiful scenery attract large numbers of Americans; they are not required to have passports. Nearly three fourths of the 89,071 visitors in 1954 arrived by air. Automobiles may not exceed 166 inches in over-all length and 14 hp.; a maximum 20-mph. speed limit is strictly enforced on the 127.81 miles of narrow, winding, hilly roads. No used cars may be imported.

In 1954 imports had an aggregate value of £12,458,711 (United States, £5,626,835; Great Britain, £2,520,430; Canada, £1,097,383); exports, including re-exports of bunkers and ship stores, £1,204,223, and alcoholic liquors, £116,308, totaled £3,246,312 (concentrated essences, £85,083; cut flowers, £26,049; pharmaceutical products, £10,301). Regular air services are operated by 8 principal companies to the United States via New York, Canada, Cuba, Mexico, Venezuela, the Caribbean, the Azores, Great Britain, and Europe.

BERNARDES, Artur da Silva, former president of Brazil: b. Viçosa, Minas Gerais, Brazil, Aug. 18, 1875; d. Rio de Janeiro, March 23, 1955. After taking his LL.B. degree from the University of São Paulo in 1900, Bernardes established a law practice in his native Viçosa. He entered politics in 1907 as a deputy in the state government of Minas Gerais. In 1909 he was elected to the federal Chamber of Deputies, and later he won election to the Senate. He also served as secretary of finance and later as president (1918-22) of Minas Gerais.

Bernardes was elected president of Brazil on March 1, 1922, over the bitter opposition of conservative army officers led by a former president, Marshal Hermes da Fonseca. Because the country continued to be in the throes of a depression following the administration of Epitácio da Silva Pessôa, Bernardes was forced to introduce an unpopular policy of strict economy, cutting government expenditures drastically and introducing new sources of revenue such as the income tax. Continually harassed by the hostility of the conservative military clique during his entire four

years in office, he was forced to impose martial law and to suppress three revolutionary uprisings. The most destructive revolt occurred in July 1924 in São Paulo, and was put down in early 1925.

In 1932, Bernardes participated in the abortive São Paulo revolt against the provisional dictatorial government of Getúlio Vargas. Exiled by the latter, he went to Portugal, where in 1934 he was named professor of Brazilian studies at the University of Lisbon. He returned to Brazil soon afterward, when the president decreed a general amnesty for political exiles. In his last years he led the parliamentary fight against the operation of foreign capital in Brazil.

BERYLLIUM. The mineral beryl is the only commercial ore of beryllium. World output of beryl reached only 5,700 metric tons in 1954, compared with 8,400 tons in 1953, and the United States produced only 10% of the world total. (See MINERAL PRODUCTION for output of major countries.)

United States production declined from 751 short tons in 1953 to 669 tons in 1954. As imports also declined from 8,245 short tons in 1953 to 5,816 tons in 1954, total supply was at the low level of 6,485 tons, compared with 8,996 tons in 1953. Consumption also dropped from 2,661 tons in 1953 to 1,948 tons in 1954; and industry stocks were, respectively, 4,987 and 4,101 short tons.

BETHUNE, Mary McLeod (née MARY McLEOD), American Negro educator: b. Mayesville, S.C., July 10, 1875; d. Daytona Beach, Fla., May 18, 1955. Former president of Bethune-Cookman College, she was nationally known for the dedication of her life to Negro advancement through education and for her contributions to interracial goodwill.

The 17th child of parents who had been slaves, she received her elementary education in a one-room school house in the vicinity of Mayesville. Later she was able to attend Scotia Seminary, a normal school in Concord, N.C., from which she was graduated in 1893. She spent the next two years at the Moody Bible School in Chicago, and was graduated in 1895.

She began her career as an educator in 1897, when she was appointed an instructor at the Haines Institute in Augusta, Ga. From 1899, the year in which she was married to Albert L. Bethune, a teacher from Savannah, Ga., until 1903, she taught at the Palatka (Fla.) Mission School. In 1904 Mrs. Bethune founded the Daytona Normal and Industrial School for Girls, which merged in 1923 with the Cookman Institute to become the coeducational Bethune-Cookman (junior) College. She served as the institution's president from 1904, when its enrollment was five students, until 1942, when its student body numbered nearly a thousand.

During two terms (1936-44) of President Franklin D. Roosevelt's administration, Mrs. Bethune served as director of the Division of Negro Affairs in the National Youth Administration and as special presidential adviser on minority affairs. She was a consultant to the United States delegation to the United Nations Conference at San Francisco in 1945.

An indefatigable and versatile worker, she held important posts in numerous organizations dedicated to the welfare of the Negroes. These included principally the National Association for the Advancement of Colored People, in which she held a vice presidency, and the National Council of Negro Women, of which she was the founder

and president. For her distinguished services to the Negro people, Mrs. Bethune received the Spingarn Medal in 1935 and the Francis A. Drexel Award in 1936.

BHUTAN. Crossed by snow-capped mountain ranges rising to more than 24,000 feet, this autonomous protected Himalayan state is bounded on the north and east by Tibet, and on the south and west by the Indian state of Assam and territory of Sikkim, respectively. Area, 18,000 square miles; pop., est., 300,000. Bumthang has superseded Punakha as the winter capital; Tashi Chho Dzong, site of the largest lamasery (300 priests), is the summer capital. The religion of the dominant Bhotias (descendants of Tibetan Mongolian race) is Lamaism.

Formerly a British protectorate, Bhutan in 1949 gave India the direction of its external affairs, and receives an annual subsidy of Rs.500,000 from the Indian government. India's political officer in Sikkim represents his government in both Tibet and Bhutan, and an agent of Bhutan is stationed in Kalimpong, West Bengal. Maharajah Jigmi Dorji Wangchuk (installed Oct. 27, 1952), is the present hereditary ruler.

Chief crops are corn, rice, millet, wheat, and mustard. Iron, copper, and silver are mined for use in the making of temple vessels, swords, and muzzle-loading rifles. Needlework is a special art in the lamaseries. Livestock breeding includes a type of hardy mountain pony.

BICYCLING. See SPORTS, GAMES, AND SHOWS —Cycling.

BILLIARDS. See SPORTS, GAMES, AND SHOWS.

BIOCHEMISTRY. **New Substances.**—It has been demonstrated that certain plant cells can grow and increase in weight but cannot divide unless a special cell division factor, called kinetin, is present. This substance cannot produce its maximal effect, however, unless the well-known growth hormone, auxin, is simultaneously present. Kinetin has been isolated from the desoxyribonucleic acid fractions from such diverse sources as herring sperm and calf thymus. Degradation studies and synthesis have established the structure as 6 furfurylaminopurine:

Neuraminic acid was first isolated many years ago, but attracted relatively little attention. As a result of a number of new studies, it has been shown to be widely distributed in animal tissues and fluids. Through the use of analysis and actual isolation, it has been found in serum, saliva, and associated with mucinous materials of the submaxillary gland and urine. It is present in the gray matter of the brain (but not in the white) and, interestingly, the concentration is markedly elevated in the brain of children afflicted with infantile amaurotic idiocy (Tay-Sachs disease). Investigations on human milk have also shown it to be present in this fluid.

New research on human milk has demonstrated the first truly qualitative difference from bovine milk. A polysaccharide containing the sugars glucosamine, galactosamine, galactose, and fucose was accidentally discovered in human milk because it proved to be a growth factor for a new strain of the bacterium, *Lactobacillus bifidus* var. Penn, isolated from the stools of nursing infants. This substance is absent from cow's milk. It is not known, however, whether this polysaccharide increases the nutritional value of human milk for the human infant.

While methyl mercaptan is not a new substance to the organic chemist, it has now been uncovered as the substance responsible for the strange odor of the breath and urine of individuals suffering from severe liver disease. It presumably arises from the metabolic destruction of the amino acid, methionine, which is found in high levels in the sera of such patients. Since methyl mercaptan and methionine are toxic in high concentrations, these may aggravate the symptoms of the disease.

Hemoglobin.—Hemoglobin, the red substance of the red blood cell, is composed of two portions—heme, an iron-containing red compound, and globin, a colorless protein. It had long been known that at least two kinds of hemoglobin existed: the hemoglobin of the normal adult, and fetal hemoglobin, found to a large extent in the red cells of the fetus and newborn but disappearing from the blood of the child in about a year. Several years ago an additional hemoglobin was discovered to be present in the red cells of individuals having sickle-cell anemia. Intensive study of the hemoglobins of humans suffering from hemolytic anemias have now shown that at least six abnormal hemoglobins exist. These are designated *a* to *h*; *a* and *f* are normal adult and normal fetal hemoglobin respectively; hemoglobin *b* is present in the erythrocytes of individuals suffering from sickle-cell anemia; the other letters refer to additional abnormal hemoglobins.

The abnormal hemoglobins differ from the normal only in the protein moiety; the heme, or iron-containing portion, is identical in all. The presence of these hemoglobins is genetically controlled, and the individual possessing one gene for an abnormal hemoglobin and one for normal hemoglobin usually has a mixture of normal and abnormal hemoglobins in his red cells; this type of person is largely free of clinical disease. If a gene for abnormal hemoglobin is obtained from each parent, then the offspring suffers from hemolytic anemia.

Curiously, the gene for abnormal hemoglobin does not have to be the same one from each parent to cause disease. Thus, if an individual inherits the gene for sickle-cell hemoglobin from one parent and hemoglobin *d* from the other, he will suffer from sickle-cell hemoglobin *d* disease, and both types of hemoglobin can be found in his red cells. A number of hemoglobin combinations have been found to lead to disease, even though the parents are symptom free, since each parent has only one gene for the abnormal type, the other gene representing the normal type.

Nutrition and Metabolism.—Experiments carried out over a period of many years have established that certain amino acids are essential for human nutrition while others are not; the latter type of amino acid is synthesized by the body cells and therefore need not be ingested intact. It has now been found that no mixture of amino acids is a complete substitute for the protein from which they are derived. It requires an increased

caloric intake to maintain nitrogen balance in an adult if the diet contains a mixture of individual purified amino acids, rather than whole protein. It therefore appears that the idea that proteins are of nutritional value only because of the amino acids they contain is something of an oversimplification. The complete protein, therefore, may contain some new component as yet unidentified, or, more likely, the body can use relatively large products of protein breakdown with greater efficiency than it can the ultimate products of protein digestion—the single amino acids.

The metabolism of carbohydrates by means of the pentose cycle was discovered a few years ago. In this cycle, glucose is oxidized to gluconic acid, then degraded to carbon dioxide and the five-carbon sugar, ribulose. Two of the five-carbon units interact and are converted to a three-carbon sugar and a seven-carbon sugar, sedoheptulose; the seven-carbon sugar is converted to glucose, thereby completing the cycle. (See also CHEMISTRY.)

BISMUTH. Bismuth is produced in substantial quantities in the United States as a byproduct in the refining of lead, but these figures are not published. Imports reached 708,300 pounds in 1952, 641,400 in 1953, and 644,300 in 1954. Exports for these years were, respectively, 244,800 pounds, 117,300 pounds, and 137,900 pounds. Domestic consumption was 1,775,000 pounds in 1952, 1,568,000 pounds in 1953, and 1,439,000 pounds in 1954. Imports in the first half of 1955 totaled 301,800 pounds; exports, 145,700 pounds; while consumption showed a strong upward trend to 926,000 pounds. (See MINERAL PRODUCTION for output of major producing countries.)

BOLIVIA. A South American republic covering an area of 424,162 square miles, landlocked Bolivia is bordered on the west by Chile and Peru, on the north and east by Brazil, on the southeast by Paraguay, and on the south by Argentina.

Population.—The latest official estimate (Nov. 1, 1954) placed Bolivia's population at 3,162,000, as compared with 3,019,031 at the 1950 census. The population density is slightly over 7 persons per square mile. Principal cities, with 1954 estimated populations, are La Paz, the seat of the national government (360,000); Cochabamba (80,000), Oruro (50,000); Potosí (40,000); Santa Cruz (35,000); Sucre, the legal capital (35,000); and Tarija (20,000).

Most of Bolivia's population is concentrated in the higher altitudes, and particularly in the altiplano plateau at heights ranging from 12,000 to 14,000 feet. La Paz, at 12,200 feet, is the world's highest big city. About 33.5% of the population is urban. The official language is Spanish, but large segments of the population speak only Indian languages, including Quechua, Aymará, and Guaraní. About 75% of the population is Indian, the remainder being composed of mestizos (cholos) and people of European descent.

Government.—Under the Constitution of 1938, as revised in 1945 and 1953, Bolivia is a unitary republic. Executive authority rests in a president who is elected directly for a six-year term, but is not eligible for immediate re-election. President Victor Paz Estenssoro took office on April 16, 1952; his National Revolutionary Movement (MNR) controls the government. The 12-man cabinet may be questioned by Congress, but is responsible only to the president. The 27 senators and 112

deputies who make up Congress are elected directly for four- and six-year terms, respectively.

Finance.—The Bolivian budget for 1955, approved by the cabinet on April 29, estimated expenditures at 30.3 billion bolivianos (U.S.\$1 = 190 bolivianos on the official market, and about 4,000 on the free market) and receipts at 29.3 billion. It was expected that taxes would yield 26.9 billion bolivianos. Government obligations, estimated at 8.2 billion bolivianos, comprised the largest proportion of expenditures; the estimate for education was 4.2 billion, and for national defense 3.6 billion.

Education and Religion.—Only an estimated 25% of the children of school age attend the 2,200 primary and 60 secondary schools, despite a constitutional provision for free compulsory education for all between the ages of 7 and 14 years. Higher education for some 7,000 students is supplied by 5 universities. In 1954 the Ministry of Education, responsible largely for urban schools, reported a total registration of 167,000 in public schools and 29,700 in private schools. This number included 123,887 in primary schools and 20,227 in high schools. For the same year the Ministry of Rural Affairs, responsible for rural education, reported a total enrollment of 105,686, largely in the first three grades. Roman Catholicism is the established religion, but free religious practice is guaranteed by the constitution.

Economic Developments.—For many years tin production has been the basis of Bolivia's economy, with taxes on its export providing about 70% of all funds for governmental operations, but phenomenal oil production added another major source of income in 1955.

Bolivia's tight exchange situation has been reflected in a steadily rising cost of living. An index calculated by the Central Bank of Bolivia shows the cost of living to have risen from 100 in April 1953 to 411 in December 1954. As a means of combating inflation, the Bolivian government has been emphasizing the greater need for the investment of foreign private capital, a radical departure from its recent nationalizing policies.

In March 1955, the government authorized general wage and salary increases. Increases authorized for male day laborers were from 70% to 75%, and for male salaried employees in private industry from 51.9% to 75%.

The United States approved \$18 million in aid on Jan. 20, 1955, including \$5 million for development assistance and nonsurplus foodstuffs and \$8.7 million worth of United States surplus food products. These funds were in addition to the more than \$4 million authorized in 1954.

Agriculture and Food Supplies.—A limited foreign exchange and an outmoded system of agricultural production have resulted in a general scarcity of basic foods. Decreases in exports during the period 1953–55 have forced the government to take substantial measures to increase the production of food. Government agencies are making special efforts to meet the urgent need for increased foodstuff production, especially of wheat (of which an estimated 30,000 tons are produced annually, as compared with a consumption of 150,000 tons), rye, rice, and potatoes. The Servicio Agrícola Interamericano, a technical service offered jointly by the Bolivian and United States governments, worked more than 10,000 acres of land in 1954. Despite all efforts, however, the government's program of agrarian reform has not attained a level of agricultural production commensurate with the country's needs.

Mining.—The value of Bolivian mineral production declined from \$121.1 million in 1953 to \$100.8 million in 1954. Exports of leading minerals in 1954 were as follows, in metric tons: tin concentrates, 29,287; tungsten, 2,667; lead, 18,227; antimony, 5,217; zinc, 20,398; and copper, 3,661. The temporary agreement signed in June 1953 by Patiño Mines and the Mining Corporation of Bolivia, under which owners receive com-

pensation for the nationalized tin mines, was renegotiated in 1955. Similar agreements were proposed to the other big mining interests, Hochschild and Aramayo.

In addition to export outlets for Bolivian petroleum products in Argentina, Chile, and Brazil, obtained in agreements signed in 1954, negotiations were begun with Paraguay in January 1955 to supply the Chaco region with 1.2 million liters of gasoline and 300,000 liters of kerosine annually; the first shipments were made in June. Total Bolivian petroleum production rose from 95,522,000 liters in 1953 to 269,482,000 liters in 1954. Construction of a \$4 million pipeline from Camiri to the Argentine border was completed on July 1, 1955; under an Argentine-Bolivian agreement, it was to carry 2,500 barrels of crude oil daily.

Foreign Trade.—Exports in 1954 amounted to \$94,300,000 and imports to \$65,500,000, as compared with \$124,522,072 and \$68,006,168, respectively, in 1953. Imports from the United States were heavy enough to require the establishment of the Bolivian Government Central Purchasing Agency in New York. Important imports included \$500,000 in raw cotton and \$14 million in foodstuffs. In addition, Bolivia acquired, under economic assistance from the United States, foodstuffs valued at over \$2 million.

Transportation and Communications.—Bolivia has approximately 1,500 miles of completed railway, including government-owned and private lines. A line from Yacuiba, Argentina, to Santa Cruz, Bolivia, was expected to be completed by October 1956, and one from Corumbá, Brazil, to Santa Cruz was completed in January 1955. The latter is a 423-mile line, supplying the final link in a 2,300-mile road and railway system reaching from the port of Arica, Chile, to Santos, Brazil, on the Atlantic Ocean. It connects the Bolivian oilfields with the largest center of industry in South America, and provides Bolivia with its first access to the Atlantic.

About 6,500 miles of roads and highways are available for Bolivia's 22,569 automotive vehicles (including 6,218 passenger cars and 14,395 trucks), exclusive of those belonging to the army. In 1955 the Export-Import Bank approved a loan of \$4.7 million to complete the paving of the 300-mile Santa Cruz-Cochabamba highway, linking the highlands with the rich agricultural lands east of the Andes.

Airway services operating in Bolivia are Lloyd Aéreo Boliviano and Pan American-Grace Airways (Panagra) which links Bolivia with other points of the Americas. The Lloyd Aéreo Boliviano line carries about 55,000 passengers and 33 million pounds of freight per year.

Principal Events, 1955.—Some 75 persons were arrested in April 1955 in connection with an alleged revolutionary plot to assassinate President Paz Estenssoro. Financial backing for the plot was attributed to the "nationalized tin companies. . . ."

On January 5, President João Café Filho of Brazil joined President Paz Estenssoro at Santa Cruz, where they jointly inaugurated the completed railroad from Corumbá to Santa Cruz. On August 4, President Carlos Ibañez of Chile paid an official five-day visit to Paz Estenssoro, allegedly for the purpose of discussing problems of mutual interest to the two countries.

During 1954 and early 1955, President Paz Estenssoro frequently refuted allegations, both foreign and domestic, that his government had

Communist leanings, labeling the Communists enemies of the regime. The government estimates that members of the Communist Party number only about 3,000; they lack a leader whose popularity even remotely approaches that of the president.

During 1955, Bolivia made notable efforts to create a climate favorable to the increase of foreign trade and the investment of foreign private capital. The president assured potential investors that no systematic policy of nationalization exists, and responsible labor leaders seemed to support this view.

BONDS. See STOCKS AND BONDS.

BOOK PUBLISHING AND SALES. Generally speaking, 1955 was devoid of spectacular new developments, but it was by far the year of greatest expansion and growth for the United States book industry.

Copyright continued to hold the center of attention in the industry during 1955. The United States acceptance of the Universal Copyright Convention in 1954 was that year's most dramatic event. Including the United States, ratification by 12 countries had been needed to make the Universal Copyright Convention operative. On June 16, 1955, the principality of Monaco became the 12th country to ratify. By September 16, when this great boon to the literary world became a reality, 30 other countries had signed but not yet ratified, and at year's end the ratifying total was approaching 20. (See also COPYRIGHTS.)

The year 1955 produced an estimated increase of between 6% and 8% in dollar sales of books. This compares with a 1% to 2% increase in 1954 over 1953. The growth of the hard-bound trade book market since 1929 may be observed in a report released by the American Book Publishers Council covering statistics extending through 1954. The number of copies of adult general books, including book club sales, sold in various years since 1929 was as follows: 1929, 73 million; 1939, 48 million; 1947, 110 million; 1954, 115 million (an increase of 57% over 1929). Sales of juvenile books, including the 25-50-cent lines, were as follows: 1929, 37 million; 1939, 35 million; 1947, 54 million; 1954, 95 million (an increase of 157% over 1929).

Domestic book output for the United States in 1955 totaled 12,589 titles, of which 10,226 were original publications and 2,363 were revised editions of previously published books. Figures for 1954 and 1955 compare in various categories as follows: fiction, 2,073 titles in 1955, as against 2,098 in 1954; general literature and criticism, 660, as against 558; and children's books, 1,485, as against 1,342. Educational titles numbered 274 in 1955 (264 in 1954), and religious titles, 849 (875 in 1954).

Paper-back publishing of the mass market variety made important strides in sales and editorial content as well as in art work and design. No absolute figure is obtainable, but the number of units sold in 1955 was well up over that of the previous year, probably exceeding the 300 million mark. A companion trend making for much better health of the market was the very noticeable decrease in dealer returns of unsold stock.

Similar developments took place in the so-called better paper-back field where prices are

higher than the drug-stationery store variety, and where distribution is confined largely to bookstores. These quality paper-backs were up in sales by 50% over 1954, and reached a figure somewhere between 2½ and 3 million units sold. Although representing an important trend, these sales were but 1% of the mass market figure.

The past year witnessed the spread of interest in the possible connection between "crime and horror" comics and juvenile delinquency. Thirty state legislatures had that topic up for consideration, and some of them passed measures aimed at curbing delinquency by censoring certain kinds of books and magazines. Among these states were New York, Connecticut, Maryland, Ohio, and Washington. In many quarters the constitutionality of these bills was questioned, and many booksellers and newsdealers complained that they imposed undue and impractical restrictions. (See also CENSORSHIP.) The Post Office Department tightened its enforcement of restrictions on the use of the mails for the circulation of subversive or indecent publications. Sen. Estes Kefauver of Tennessee conducted a thorough investigation of the distribution of pornographic material.

At its annual national convention, and at a series of regional meetings held throughout the country, the American Booksellers Association gave formal recognition to the desirability of establishing a national TV program designed to promote books. By the close of 1955, plans were under way to make such a program a reality before the end of 1956.

In his report to the nation on the Summit Conference of heads of state in Geneva (see GENEVA CONFERENCE), President Eisenhower singled out books as a prime medium for the cultural exchange which was to mark the easing of the cold war between East and West. Hopes were raised and preliminary plans were made for a large-scale interchange of books, but these hopes suffered along with the rest of the agenda at the October-November Geneva meeting when the Big Four foreign ministers failed to reach agreement.

American books exported to free countries of the world through normal commercial channels jumped from an estimated \$6 million in 1939 to about \$40 million in 1955. Public and private agencies in the United States (the U.S. Information Agency, foundations, and other groups) expanded their translation and other programs designed to increase the availability of books abroad. Representatives of these agencies met with publishers, librarians, educators, and business executives in late September at Princeton, N.J. This conference on American Books Abroad, sponsored by the National Book Committee, discussed ways and means of finding out what books are needed and how to deliver them overseas. The reverse flow of books was similarly impressive with imports of translations from the Far East, especially from Japan, showing a marked increase in 1955.

(See also AMERICAN LITERATURE; CANADIAN LITERATURE; CHILDREN'S LITERATURE.)

JOSEPH A. DUFFY,

Executive Secretary, American Booksellers Association, Inc.

BORNEO. Lying north of Java, northeast of Sumatra, and separated from Celebes by the Macassar Strait, Borneo (area, 286,916 square miles) is the largest among the four principal islands of the Malay Archipelago, and the third largest island in the world. Near its greatest

width (600 miles) it is crossed by the equator. British Borneo, occupying the northern part of the island, comprises the contiguous colonies of Sarawak and North Borneo, the former containing in two separate areas the protected sultanate of Brunei. The island settlement of Labuan (pop., 8,784 in 1951; capital and chief town, Victoria) was attached to North Borneo on July 15, 1946. Formerly known as Dutch Borneo, the southern part of the island (208,232 square miles, or 73.79%) became a constituent unit in 1949 of the Republic of Indonesia (q.v.), known as Kalimantan.

The areas, populations, and capitals of the components of British Borneo are as follows:

	Area (sq. mi.)	Population (1955 est.)	Capital
North Borneo.....	29,837	355,000	Jesselton (11,704)
Sarawak.....	47,071	602,000*	Kuching (37,954)
Brunei.....	2,226	52,600	Brunei (13,500)
Total.....	78,684	1,009,600	

* Midyear 1954.

The three British territories are coordinated administratively with British Malaya by a commissioner general in Southeast Asia (Sir Robert Heatlie Scott), and are served juridically by a single supreme court.

The area is rich in natural resources. In Brunei the largest oil fields in the British Commonwealth are operated, and petroleum is also an important export of Sarawak. Rubber, the most valuable export of North Borneo, is produced also in Brunei and Sarawak.

Malayan Airways operates a service five times a week from and to Singapore, with service to Kuching and Sibiu in Sarawak; to Labuan; and to Jesselton and Sandakan in North Borneo. An international airport is being built in Brunei.

NORTH BORNEO

The colony is located at the northern end of British Borneo, northeast of Sarawak and Brunei. A governor (R. E. Turnbull, assumed office March 4, 1954), is assisted by a 9-member Executive Council (including 4 nonofficials—1 native, 1 Chinese, 2 Europeans), and a 22-member Legislative Council (including 10 nonofficials—3 natives, 3 Chinese, 1 Eurasian and 3 Europeans). Revenue in 1954 was M\$34.4 million; expenditure, M\$35.6 million (one Malayan dollar = 32.5 U.S. cents), including Reconstruction and Development and Colonial Development allocations of M\$10.5 and M\$3.8 million, respectively, and loan expenditures of M\$4.5 million. No further subvention to the budget was to be sought from the United Kingdom after 1955.

Schools of all types at the end of September 1954 numbered 249 (government 75, including a trade school and a teacher-training college; mission, 67; Chinese, 81; and others, 26), with a total enrollment of 26,420, of whom 1,994 were receiving secondary education.

Estimated crop acreages and production in 1954 included rice, 73,125 (50,220 tons of paddy); rubber, 120,418 (17,115 tons exported); copra, 45,663 (26,645 tons exported, including re-exports); and hemp, 3,900 (1,876 tons exported). Production in 1954 of high-grade cigar wrapper leaf for the European market was estimated at 280,000 pounds. Acreage under native tobacco in 1954 was estimated at 1,200 acres, producing about 720,000 pounds of prepared tobacco, most of which went to local markets. Exports of estate- and native-grown tobacco totaled 311,326 pounds. Forests occupy 77% of the total land area. Production of timber in 1954 was 14,905,437 cubic feet, of which 10,472,623 was exported.

Imports in 1954 were valued at M\$74.3 million; exports, M\$77.2 million, including rubber, M\$24 million; timber, M\$17.4 million; copra, M\$13.8 million, including re-exports; and tobacco, M\$3.5 million.

A 116-mile railway connects Jesselton on the west coast with Tenom in the interior, and extends to Weston on Brunei Bay. In 1954, metalled roads totaled 248 miles; earth roads, 249 miles. Sandakan, Jesselton, Labuan, and Tawau are the major ports.

SARAWAK

The colony comprises a 450-mile coastal strip of northwestern Borneo. A governor (Sir Anthony F. Abell, assumed office April 4, 1950) is assisted by a Supreme

Council and a 25-member Council Negri (State Council), which includes 11 nominated nonofficials and 14 natives who are members for life. Recommendations are under consideration for a nonofficial majority on the council.

In 1954 there were 31 district schools, staffed by 74 teachers, with 2,239 pupils; 112 local-authority schools (174 teachers, 5,515 pupils); 54 private schools (66 teachers, 2,573 pupils); 94 mission schools (381 teachers, 10,622 pupils); and 242 Chinese schools (1,084 teachers, 30,084 pupils). Pupil enrollment totaled 52,788, and estimated expenditures on education, M\$2,-218,547.

The chief tree crop is rubber. Under the government's development plan, M\$1.5 million has been allocated for rubber replanting projects, with a subsidy to cultivators of M\$200 per acre. Sarawak's staple food is rice. In spite of excellent harvests in 1953 and 1954, production fell short of requirements; 23,477 metric tons were imported in 1954. Sago is grown on 150,000 acres; coconut plantations occupy 21,000 acres. Natural forests cover 34,000 square miles; forest revenue, including exports to 14 countries of 29 different kinds of timber, totaled M\$1,198,365 in 1954.

Oil production at Miri by the Sarawak Oilfields (a subsidiary of the Royal Dutch Shell Oil Company) totaled 503,429 barrels, valued at M\$3,687,142 in 1954. Other mineral production in 1954 included phosphate (620 long tons, M\$101,120) and building materials (M\$1,068,744, est.).

Exports in 1954 were valued at M\$425,984,000, including petroleum, M\$300,089,301; rubber, M\$31,078,000; and pepper, M\$43,688,400. Imports were valued at M\$397,517,000, including foodstuffs, M\$46,172,400; petroleum, M\$268,922,100; and manufactured goods, M\$36,793,300.

There are 470 miles of roads, but rivers afford the principal means of internal transportation. A broadcasting station was opened in 1954.

BRUNEI

The territory of Sarawak divides this British-protected sultanate on the northwest coast into two separate parts. The governor of Sarawak is high commissioner, and a British Resident (J. C. H. Barcroft) heading an 11-member State Council, administers the state on behalf of Sultan Sir Omar Ali Saifuddin (acceded June 6, 1950), aided by district advisory councils. From these councils it was proposed in 1955 that representatives be selected to serve as members of the State Council. Malays (41% in 1951) predominate in the population, of which other indigenous races compose 25%, and Chinese, 24%.

Coastal oilfields at Seria, operated by the British Malayan Petroleum Company (subsidiary of the Royal Dutch Shell Oil Company), are the largest in the British Commonwealth, making Brunei a wealthy state, with revenue (75% from petroleum royalties) exceeding expenditure by M\$75.52 million in 1953. Revised estimates in 1953 showed revenue of M\$99,367,000; expenditure, M\$23,845,500 (M\$589,000 for education). Brunei's M\$100 development plan, introduced in 1954, includes agricultural improvement and provision from the territory's own resources for communications, power, health service, and education, the latter being extended free at primary level to all children between the ages of 6 and 12 years. Schools in 1953 numbered 48 (Malay 34; mission, 6; and Chinese, 8), with aggregate enrollment of 7,144. Payment of old-age and disability pensions of M\$20 per month to all persons over 60 years of age came into effect April 1, 1955.

Crude oil exports, sent by pipeline to the Lutong refinery in Sarawak, totaled 4,712,000 tons in 1954. Plantation rubber is also a valuable export. There are no railways. Highways total 160 miles (56 miles all-weather).

DONOVAN ROWSE,
Author and Publicist.

BOSTON. Chief city of New England and most populous capital city in the United States, Boston is one of the smallest in area (47.8 square miles) of any large city, but ranks 10th nationally in population (1954 est., 829,598). The Boston metropolitan area ranks 6th nationally in population (2,369,986 in 1950).

The new city charter, adopted in 1951, provides for a mayor with a term of four years and a City Council of nine members elected at large and without party designations for two-year terms. In the election of Nov. 8, 1955, the incumbent mayor, John B. Hynes, was re-elected to his third term. During Hynes' second term he had completed the reorganization and consolidation of city departments, which now function under an administrative director. The city's School Committee, a board of five members elected for two-year terms, has absolute control of the conduct and operation of the

WIDE WORLD

Boston's Old North Church, damaged by hurricane Carol on Aug. 31, 1954, receives a new steeple on July 6, 1955.

school department. Its budget must be approved by the mayor, but he may not reduce it.

The total city budget (1954) provided for the expenditure of \$154,819,459. Tax rate (1954): \$69.80 per \$1,000 of assessed valuation (\$1,566,676,000). Gross debt (Dec. 31, 1954): \$123,180,500; net debt, \$63,-584,472.

Average public school enrollment (1954): 97,474 (kindergarten, 8,151; elementary and junior high, 54,546; senior high, 16,201; and special schools, 1,800).

Tonnage shipped through the port of Boston (1954): 4,486,050 import tons (\$416,500,000) and 338,200 export tons (\$85,600,000). Total employment (metropolitan area, 1950): 611,647 males and 303,306 females. Manufacturing employment (August 1955) for the Boston district: 219,300, including 162,600 production workers who averaged \$72.14 weekly; for Boston city proper, 91,700, including 68,700 production workers who averaged \$70.74 weekly. Unemployment in the Boston district (March 1955): 96,767.

The Boston Artery, a state-financed highway officially named in honor of John F. Fitzgerald, former Boston mayor, was opened for traffic as far as Fort Hill Square in 1955, at a cost of \$100 million. Part of the highway will pass through the widest automobile tunnel in the United States and will have six lanes and intermediate ramps extending for 2,400 feet in front of the South Station. Construction on this section, to cost \$13.5 million, was scheduled to start on Nov. 15, 1955.

Buildings in the area of the tunnel have been removed, and the wide plaza will be used for the expansion of the downtown shopping district. Six new garages had been constructed by late 1955, and plans were made to use the area above the train sheds back of South Station as additional parking places for 10,000 cars.

The \$4,136,000 South End redevelopment project, the city's first slum-clearance project, got under way in 1955. Buildings were demolished on a 22-acre site, and new streets were being laid out to make the area suitable for light industrial and commercial purposes.

In an advisory opinion requested by the state legislature, the Massachusetts Supreme Judicial Court held it to be unconstitutional to make tax concessions on the proposed development on the site of the Boston and Albany yards on Huntington Avenue. This project was postponed until new financing could be devised.

Among other developments in 1955, a new steeple for the Old North Church was dedicated on October 12, replacing the one blown over by Hurricane Carol on Aug. 31, 1954; and metropolitan Boston's first noncommercial television station, WGBH-TV, went on the air on May 2.

DENNIS A. DOOLEY,
Massachusetts State Librarian.

BOTANY. Taxonomy.—Gratifying progress has been made in this, the oldest discipline in plant science. Before the turn of the century, taxonomists were largely limited to characteristics supplied by external structure for use in naming and classifying plants; often much taxonomic work was confined to the study of dried specimens with little reference to the living plant. Now, however, it appears that taxonomy may well become the integrating center in plant science, with emphasis shifted to the totality of characteristics as the basis of classification.

Accordingly species are being thought of as populations with a certain degree of essential homogeneity based on characteristics from cytology, genetics, and comparative biochemistry, as well as on the comparative morphology of the flower, pollen, fruit, vascular system, growing regions, leaf, node, glandular structures, and pubescence. Geographic distribution and response to environment, particularly soils and climate, are often of critical importance in determining possible relationship.

The increased amount and complexity of available data frequently require biometric treatment for adequate evaluation (Whitehead, F. H., "An Example of Taxonomic Discrimination by Biometric Methods," *New Phytologist*, 53:496, 1955). This new taxonomy is well illustrated in a recent paper by A. J. Cronquist ("Phylogeny and Taxonomy of the Compositae," *American Midland Naturalist*, 53:478, 1955).

Plant Serology.—M. A. Johnson ("The Precipitin Reaction as an Index of Relationship in the Magnoliaceae," *Bulletin of the Serological Museum*, 13:1, 1954) and his students, W. C. Baum ("Systematic Serology of the Family Cucurbitaceae, with Special Reference to the Genus Cucurbita," *Bull. Ser. Museum*, 13:5, 1955) and H. D. Hammond ("Systematic Serological Studies in Ranunculaceae" and "A Study of Taxonomic Relationship within the Solanaceae as Revealed by the Proton'er Serological Method," *Bul. Ser. Museum*, 14:1, 1955) have used the precipitin test for indicating protein similarity from which relationship may be deduced. This method has been particularly successful in determining relationship among animals.

The technique is relatively simple. A plant protein is injected into the rabbit as the experimental animal. Antibodies are formed in the blood of the animal, and when these are reacted with the original protein in a test tube, a white precipitate is formed. When protein from a related species is reacted with these antibodies, a precipitate is formed but in lesser amount. The amount of precipitate indicates the degree of protein similarity and hence provides the basis for estimating the possible degree of relationship.

Chloroplasts and Photosynthesis.—D. I. Aron, his coworkers, and other investigators have succeeded in isolating chloroplasts from green cells which, when placed in a suitable medium, are capable of photosynthesis (*Science*, 122:9, 1955). Thus the chloroplast functions as a complete photosynthetic unit with its complement of en-

zyme systems independent of those in the cytoplasm of the cell.

Isolated chloroplasts may become valuable material for experimental study because, paradoxical as it may seem, much fundamental biochemical information has been discovered only when certain processes have been isolated and carried on outside the living cell. Even so, the isolated chloroplast is an extremely complicated biochemical system, for it is the seat of the photodecomposition of water, of photosynthetic phosphorylation, and of the fixation of carbon dioxide with the resulting production of starch. Starch formation is preceded by the elaboration of: (1) phosphate esters of fructose, glucose, ribulose, and dihydroxyacetone; (2) glycolic, malic, and aspartic acids; and (3) alanine, glycine, and free dihydroxyacetone. Aron is of the opinion that the discovery of photosynthetic phosphorylation, through which light energy is transformed into chemical energy, may be a promising approach to this problem—a problem which man must solve if he is to exploit solar energy fully.

Chlorophyll.—Now that certain unsupportable claims for the use of chlorophyll are diminishing, we may well examine the evidence for its economic value (Kephart, J. C., "Chlorophyll Derivatives—Their Chemistry, Commercial Preparation and Uses," *Economic Botany*, 9:3, 1955). Certainly chlorophyll retains its position as one of the most significant organic compounds for the world of organisms because of its role in photosynthesis. At present, 80,000 pounds of chlorophyll are extracted annually from alfalfa in the United States. When properly extracted, processed, and prescribed, its derivatives have real value in medicine for treatment of anemia, hypertension, and certain types of wounds; also as deodorants and in oral hygiene.

Flowering Hormone.—Jersey varieties of sweet potatoes are grown so far from their native habitat that they fail to flower in continental United States. As a consequence, breeding programs in the development of new varieties are hampered for lack of flowers. S. Lam and H. B. Cordner (*Science*, 121:140, 1955) have secured an abundance of flowers by the simple expedient of grafting sweet potato shoots on morning-glories (*Ipomea tricolor* and *I. hederacea*). This is readily possible since the morning-glory and sweet potato are of the same genus. The number of flowers is roughly proportional to the number of leaves on the morning-glory stock; if all leaves are removed from the stock, the sweet potato scions fail to flower. It is postulated that a flower hormone is synthesized in the morning-glory leaves and transferred from stock to scion.

Nutrient Deficiencies.—M. Chessin and H. A. Scott (*Science*, 121:112, 1955) have found that the diseased areas induced by tomato mosaic virus are larger when the host plants are deficient in iron and sulfur. No increase in lesion size is obtained when plants are deficient in calcium or magnesium. This work suggests that mineral nutrition may be of importance in the development of systemic infection in plant viruses.

It is well known to plant physiologists that copper at the level of a few parts per million in the nutrient media may be required for normal plant growth; also that above this level, copper may be highly toxic. R. Child (*Tropical Agriculture*, 32:100, 1955) reports that tea leaves must contain 12 parts per million of copper for the production of high-quality beverage. This is because polyphenol oxidase, an enzyme with a

copper-protein base, is essential for fermentation of the tea leaves in commercial processing.

BRANDO, Marlon, American actor: b. Omaha, Nebr., April 3, 1924. One of the most powerful performers on the American stage and screen, he was chosen best male actor of 1954 by the Academy of Motion Picture Arts and Sciences (an-

COLUMBIA PICTURES CORP.

Marlon Brando in a scene from *On the Waterfront*. His role won him the 1955 Academy Award for best actor.

nounced March 30, 1955) for his portrayal of Terry Malloy in the Academy Award-winning *On the Waterfront*.

Marlon Brando completed his formal education in 1943, when he withdrew from Shattuck Military Academy in Faribault, Minn., shortly before graduation. In the fall of that year he enrolled in the Dramatic Workshop of the New School for Social Research in New York City. Influenced by the teaching of actress Stella Adler, he developed a naturalistic acting technique that was both communicative and intense, and he subsequently appeared in several student productions directed by Erwin Piscator.

In his first appearance on Broadway as the 15-year-old Nels of Kathryn Forbes' *I Remember Mama* (1944), Brando drew only mildly favorable reviews. Then followed a series of roles that were generally praised by the critics: Sage McRae in Maxwell Anderson's *Truckline Café* (1946); Eugene Marchbanks in Katharine Cornell's revival of George Bernard Shaw's *Candida* (1946); and David in Ben Hecht's *A Flag Is Born* (1946). After a brief period of study and foreign travel, he returned to the Broadway stage as Stanley Kowalski in Tennessee Williams' turbulent Pulitzer Prize play, *A Streetcar Named Desire* (1947).

Brando's motion picture career began with *The Men* (released in 1950), in which he portrayed with delicate sensitivity and power a bitter paraplegic veteran. Next, he recreated Stanley Kowalski in a motion picture adaptation of Williams' play (1951). There followed roles as Emiliano Zapata in John Steinbeck's *Viva Za-*

pata! (1952); Mark Antony in Shakespeare's *Julius Caesar* (1953); a young hoodlum, who possesses a human, if chaotic, heart, in *The Wild One* (1953); Terry Malloy in *On the Waterfront* (1954); and Napoleon in *Désirée* (1954). In 1955, Brando turned to musical comedy in the role of Sky Masterson in the film version of *Guys and Dolls*.

BRASS AND BRONZE. As reported by foundries in the United States to the U.S. Bureau of Mines, the consumption of brass and bronze ingots declined from 255,770 tons in 1953 to 242,497 tons in 1954. In addition, 6,000 tons were used in 1954 in wire mills. Shipments of brass ingot totaled 291,000 tons in 1954. Because virtually all of it (except 6,000 tons to mills) was shipped to foundries, it is estimated that foundry consumption was about 85%. Consumption in 1954 included 143,268 tons of leaded red brass, 43,599 tons of leaded tin bronze, 17,991 tons of leaded yellow brass, 13,045 tons of manganese bronze, 12,831 tons of tin bronze, and 11,763 tons of other products. Geographically, the chief consuming states were: Ohio, 15%; Pennsylvania, 13%; Illinois, 11%; New York, 8%; Michigan and California, 7% each; Wisconsin and Indiana, 5% each; and Connecticut and Massachusetts, 4% each.

BRAZIL. A Portuguese-speaking republic which covers nearly half of South America, Brazil fills the great eastern bulge of the continent with its 3,288,042 square miles of territory. As of July 1, 1955, its population was estimated at 58,456,000 (exclusive of jungle Indians). The two largest cities, with their 1953 estimated populations, are the great industrial center of São Paulo (2,564,411), one of the most rapidly growing cities in the world, and the beautiful capital, Rio de Janeiro (2,604,018). Other cities with populations (1953) of over 400,000 are Recife (595,035), Salvador (463,260), Porto Alegre (441,262), and Belo Horizonte (412,262).

Government.—When Dr. João Café Filho, vice president under the late Getúlio Vargas, took over the executive power on Aug. 24, 1954, to finish the presidential term ending on Jan. 31, 1956, he became ineligible for a successive term in office. The hotly contested elections of Oct. 3, 1955, resulted in the selection of Juscelino Kubitschek as president for the next 5-year term. One month later, President Café suffered a heart attack which, on November 8, led to his request for an indefinite leave of absence. Carlos Luz, who, as speaker of the Chamber of Deputies, was next in line of succession, became provisional president on that day. A military coup then resulted in congressional replacement of President Luz by Nereu Ramos, speaker of the Senate (November 11). When physicians pronounced President Café well enough to resume the presidency, Congress declared him "unable to continue in office" (November 22). Since he refused to resign, Brazil was unconstitutionally ruled by a *de facto* government under a state of siege declared on November 25. There were two presidents. (See also below, *Principal Events*, 1955.)

Legislative power rests in a bicameral Congress, with senators and deputies serving 8- and 4-year terms, respectively. The judiciary is headed by a Supreme Court in Rio de Janeiro.

Education and Religion.—In addition to the federal University of Brazil, located in Rio de Janeiro, Brazil has seven state and three Roman Catholic universities; in 1953 they had a combined enrollment of 288,131. As of 1954, there were 796 pedagogical schools with 59,521 students, and 2,485 secondary schools with 535,775 students. In 1953 there were 99,809 elementary schools with 6,258,976 pupils. In September 1954, Brazil opened its first school of business administration, with a 12-week course to provide modern training in business management.

Roman Catholicism is the dominant religion; 93% of the population were listed as of this faith in the 1950 census.

Economic Conditions.—Although the industrial production index rose from 146 in 1953 (1948 = 100) to 156 in 1954, the accounts of the federal

government in 1954 showed a deficit of 7,122 million cruzeiros,* with expenditures of 53,661 million and revenues of 46,539 million. The 1955 budget revenues were estimated at 53,482 million cruzeiros and expenditures at 56,497 million, leaving a theoretical deficit of 3 billion cruzeiros. In his summary of the nation's financial outlook for the fiscal year, however, President Café disclosed that to the budget's admitted deficit, 5 billion cruzeiros were added for an emergency bonus to civil service workers, 3 billion for expenses incurred by government-controlled companies, and 2 billion in allocations brought forward from 1954—in all, an additional financial burden of almost 14 billion cruzeiros for which there was no corresponding revenue.

There was serious inflation in 1954, and the increase in national income to 410 billion cruzeiros from 337.4 billion in 1953 represented little change in real values. During the year the money supply increased by 23%. The general wholesale price index rose from 188 in 1953 (1948 = 100) to 245 in 1954 (269 in June 1955), and the cost-of-living index in São Paulo from 162 to 190 (225 in June 1955).

As of June 30, 1955, Brazil's dollar debt obligations reached \$1,061,465,000, representing an aggregate of 41 loans dating back to 1940. The amount of credit extended by Brazil's own banking institutions in 1954 amounted to 203,377,180,000 cruzeiros. Despite discouraging principal and interest payments, however, in 1954 bank deposits increased to 177,089,228,000 cruzeiros, and 586 new organizations with a total capital of 7,348 million were set up.

In 1954, Brazilian exports totaled \$1,562 million, and imports, \$1,634 million, leaving a deficit of \$72 million. In the first six months of 1955 exports dropped to \$613 million from \$730 million in the same period of 1954, and imports fell to \$662 million, from \$749 million in 1954. Finance minister José Maria Whitaker attempted to liberalize exchange restrictions and so improve the trade situation, but his program was rejected, and he resigned on Oct. 10, 1955.

A commercial agreement with Bolivia, designed to save the foreign exchange needed in petroleum purchases, became effective in January 1955; it provides for a monthly exchange of Bolivian gasoline and kerosine in return for Brazilian coffee, cotton, and hides. It is distinct from a previous arrangement by which Brazil is to share in the exploitation of Bolivian oilfields in return for having aided in financing the Corumbá-Santa Cruz railway to the oil region.

Agriculture.—Farm output in 1954 was valued at 140 billion cruzeiros, an increase of about 26% over 1953. At the end of 1954, Brazil had 2,064,519 farms and other agricultural establishments, occupying 563,442,464 acres, but only 8.6% of the nation's vast area was under productive cultivation; pasture land accounted for 46% of the total, 24.1% was woodland, and 14.5% was cultivable but not under cultivation.

Of the export crops, coffee usually produces some two thirds of the nation's foreign exchange income, but in the 1954-55 crop year Brazil exported only 10,796,677 bags (132 pounds each), a 24.7% decline from 1953-54. For the year beginning July 1, 1955, there was a carry-over of 8.4 million bags, and the new crop was estimated at 17.2 million bags.

Among other important export crops, cacao production for the year ending May 30, 1955, re-

* As of August 1955, U.S.\$1 = 18.82 cruzeiros at the official selling rate, and 71 at the free rate.

sulted in a record export of 2,776,151 bags. The 1954 sugar crop, at 39,048,431 tons, was the largest on record. The ginned cotton output was 447,295 metric tons, as compared with 374,913 tons in 1953. The 1954 jute harvest, totaling 45 million pounds, put Brazil in third place among world producers and raised production above domestic needs. Rubber production in 1954 amounted to 21,272 tons, but it was still necessary to import 16,308 tons. Tobacco production totaled 340,000 bales in 1954, the best yield in five years, but the 1955 crop, reduced by drought, was expected to reach only 100,000 bales.

As for its cereal crops, Brazil produced 7.1 million metric tons of corn and 3.4 million tons of rice in 1954, and in 1955 expected to have an exportable rice surplus of over 1 million tons. The situation in wheat, however, continued unfavorable. Although production was about 800,000 tons in 1954, the 1955 crop was estimated at only 500,000 tons, necessitating large imports.

Industry.—Brazil has an industrial plant second to none in Latin America, but its industrial growth is hindered by the need for more electric power and for fuels (notably oil). Due to the opening of two new power plants—the 200,000-kw. Piratininga steam plant in the State of São Paulo and the 330,000-kw. Nilo Pecanha underground plant in Rio de Janeiro, electricity rationing was not as severe as usual in the capital in 1954, even though consumption was up 20% and considerable power still had to be diverted to the São Paulo system. All three of the 60,000-kw. units of the great Paulo Afonso hydroelectric power development on the São Francisco River were in operation by mid-1955, supplying power to eight northeastern states, and a new hydroelectric plant was also inaugurated at Itutinga in Minas Gerais.

Petroleum imports take an increasing amount of Brazilian foreign exchange (about \$275 million in 1954) despite efforts to increase domestic refining facilities. In late 1954 production of refined petroleum products, chiefly at the Mataripe refinery in Bahia, totaled about 5,500 barrels per day, or slightly over 2.5% of consumption. New refineries inaugurated in December 1954 were the Manguinhos refinery at Rio de Janeiro (10,000 barrels per day) and the Capuava refinery in the State of São Paulo (25,000 barrels). In January 1955, a third refinery, at Cubatão, São Paulo, began operating; its capacity is 53,000 barrels per day.

Production of rolled steel products in 1954 was 1,171,893 tons, of which 550,000 tons came from the great national steel plant of Volta Redonda. Consumption was estimated at 1,715,500 tons in 1955, and plans were being made to increase production to 1.8 million tons. At the end of May, President Café inaugurated at Sorocaba, São Paulo, an aluminum plant scheduled to begin production at 10,000 tons a year.

The output of the cement industry in 1954 reached a record 2,439,968 tons, but 340,000 tons still had to be imported. In the first six months of 1955 production totaled 1,148,667 tons, or 20.9% over the corresponding period in 1954. Brazil's five-year-old plastics industry expanded to an output of 11,475 tons in 1954.

The automobile and truck assembly industry had a 100,000-unit capacity as of July 1955. Tire production in 1954 totaled a record 2,054,246 units; inner tubes, 1,284,698 units. Production for 1955 was expected to rise to 2.3 million and 1.44 million units, respectively. Airplane manufacturing is as yet limited to the assembling of

training planes for the Brazilian Air Force from parts imported from the Netherlands by Fokker Industria Aeronáutica, a joint stock company working under contract with the government.

Mineral Products.—To add to present riches in manganese and iron (1,678,000 metric tons of iron ore were exported in 1954), new deposits of iron ore were discovered in Minas Gerais and of manganese in the Territory of Amapá, along the border of French Guiana, in 1955. A large bauxite deposit, with a mineral content of over 69%, has been found in the same territory.

Brazil is potentially rich, too, in petroleum, for it has 6% of the world's sedimentary rock, the type in which oil is found. At present only the wells around Bahia are producing, but new deposits have been discovered at Nova Olinda and Marajó Island in the Amazon Basin.

Transportation and Communications.—In 1955 a new railway, linking Corumba with Santa Cruz in Bolivia, was inaugurated, and another new line, from São Paulo to Porto Alegre, was under construction. Some 90% of the existing track (20,492 miles as of 1953) is almost unusable, and half the locomotives are over 40 years old. In 1954 the deficit on the federally owned lines amounted to 3.6 billion cruzeiros.

Brazil's 212,325 miles of roads (1952) are in such generally poor repair that 15% of the country's vehicles are scrapped annually, and trucks have an average life of only three years. In 1954 only 7,974 passenger cars and 34,796 trucks and buses could be imported, while in the first six months of 1955 vehicle imports dropped to a total of 2,316 passenger cars and 8,251 trucks and buses.

Replacement problems also face Brazilian shipping. Of 307 vessels in the coastal fleet, only 30 are modern ships capable of carrying out merchant marine operations; 51 vessels, representing 150,000 tons, are 40 years old. Shipping facilities were improved in 1955 by the order of 9 new vessels for the line which travels the 2,000-mile Amazon route from Belém to Iquitos, Peru; by the opening of the São Sebastião port to ease the congestion at Santos; and by the allocation in the budget of over 600 million cruzeiros for new port construction and equipment, as well as a National Economic Development Bank loan of 113,240,000 cruzeiros specifically for work at Santos.

At the end of 1954, 11 foreign and 5 national lines were providing air service between Brazil and foreign countries. Air transport news of 1955 included authorization of Bolivia's Lloyd Aéreo Boliviano to operate in Brazil and the opening of direct New York-Rio de Janeiro service by Braniff Airways.

As of Jan. 1, 1954, Brazil had 679,540 telephones, and by mid-1955 there were four television stations in the country.

Principal Events, 1955.—Aside from President Café Filho's state visit to Portugal in April and the meeting of the 36th International Eucharistic Congress in Rio de Janeiro (July 17-24), the main events which marked the year were political, centering on the election of the president and vice president to take office on Jan. 31, 1956.

Despite Conservative gains in the congressional and gubernatorial elections of 1954, there was a leftist trend in the 1955 contest for the presidency, which was won in the October 3 election by Juscelino Kubitschek, a former governor of Minas Gerais, with João Goulart as vice president. Backed by Brazil's two strongest political parties, the Social Democratic Party and the

UNITED PRESS

Brazil's President Juscelino Kubitschek, elected Oct. 3, 1955, is hoisted to shoulders of jubilant supporters.

Labor Party, they represent left-of-center policies.

Since the election of Senhor Goulart on this ticket would mean the return to power of forces ousted by the military in 1954, the contest for the presidency filled the year with political maneuvering. An attempt to forestall any possibility of military intervention in the election by the united backing of a coalition candidate failed, as did certain legislative measures. Bills to eliminate the vice presidency, to require an absolute majority for election, and to change from a presidential to a parliamentary system failed in Congress, where a combination of Social Democratic and Labor votes was dominant. Two other main candidates entered the race—Maj. Gen. Juarez Távora and Adhemar de Barros. After the outlawed Brazilian Communist Party publicly announced support of the Kubitschek-Goulart ticket and there was no refusal of such aid, what had promised to be a close race became explosive with the possibility of civil war. (Estimates of the number of Communist votes among the some 9.5 million cast in the election ranged from 300,000 to 500,000.) Of the total number of votes, Kubitschek received 2,878,345, compared with 2,543,067 for General Távora, his closest opponent.

In accordance with the promise of President Café and his war minister, Lieut. Gen. Henrique Teixeira Lott, both of whom were determined that the will of the Brazilians should be honestly expressed, the election had been one of the most orderly ever held in the country. Unfortunately, the war minister was also determined that the electoral decision should be carried out, even if by unconstitutional means. Knowing that neither President Luz nor President Café had favored the Kubitschek candidacy, General Lott led the army coup which promptly drove President Luz from office, promoted congressional installation (November 11) of Nereu Ramos as his successor in the presidency, and—again with the support of Congress—deprived President Café of his constitutional right to return to office (November 22).

MADALINE W. NICHOLS,
Specialist in Latin American Affairs.

BREWING INDUSTRY. The calendar year 1954 saw the continuation of marketing trends in the United States which have raised public and social acceptance of beer to its highest level. Although sales of 83,305,402 barrels fell far short of the all-time peak of 87,172,334 barrels in 1947, a nationwide survey indicated that beer probably was consumed by more Americans in 1954 than ever before. In 1954, nearly two thirds of all American families served beer at home, and 3,691,400 more families did so than five years previously. Women now account for 22% of all malt beverage consumption.

As a result of the trend toward increased home consumption, packaged beer accounted for 76.7% of all beer sales—a new record. Of packaged beer, 63.2% was in returnable bottles, 5.3% in nonreturnables (no deposit), and 31.5% in cans—another new high.

For the second consecutive year, beer was a billion-dollar producer of public revenues through payments of \$744,304,000 in federal taxes (at \$9 per barrel), \$198,977,000 in state taxes, and an undetermined total in local taxes.

It is the belief of market analysts that state tax rates continued to exert an influence on local beer sales. Wisconsin, Nevada, and Michigan, each with a comparatively low state tax, respectively led in per capita consumption. North Carolina, Mississippi, and Alabama, each with a relatively high state tax, had the lowest per capita consumption.

The United States, with per capita consumption of 15.9 gallons, ranked eighth among all countries. On the basis of compilations by the Brewers' Society, London, it was led by Belgium, Luxembourg, Australia, New Zealand, the United Kingdom, Denmark, and West Germany.

The 1955 edition of the *Brewers Almanac*, published by the United States Brewers Foundation, Inc., showed that American breweries exported 1,960,895 gallons of beer and ale, exclusive of about 31,000,000 gallons for the armed forces overseas.

Weekly earnings for brewery production workers averaged \$92.80, a new high, as compared with \$71.86 for all manufacturing.

EDWARD V. LAHEY,

Chairman and President, United States Brewers Foundation, Inc.

BRIDGES. Mackinac Straits Bridge.—A dream of American bridge engineers—to link Michigan's upper and lower peninsulas with a long-span suspension bridge across deep water of the Straits of Mackinac—was coming true in 1955. The nation's biggest bridge project progressed favorably, as difficult underwater pier construction was brought near completion, and as superstructure work began on the \$80 million project. Sinking of the caisson foundations for the suspension span's towers was an outstanding feat of bridge construction. One footing is 195 feet and the other 190 feet below water level; each is 116 feet in diameter.

To be completed late in 1957, this four-lane toll bridge will make possible a 10-minute crossing from Mackinaw City to St. Ignace, instead of a 53-minute ferry trip. The structure will be the world's longest suspension bridge—8,614 feet from anchorage to anchorage. But its 3,800-foot center suspension span will be exceeded by the 4,200-foot main span of San Francisco's Golden Gate Bridge. The two main towers, each containing 6,250 tons of structural steel, will rise to 552 feet above water level. There will be a clearance

of 148 feet between water level and the underside of the structure's main span.

New Orleans Bridge and Causeway.—Construction continued in 1955 on a new highway crossing of the Mississippi River. It is to have the longest cantilever span (1,575 feet) in the United States, and will be exceeded only by the 1,800-foot main span of the Quebec Bridge crossing the St. Lawrence River.

The Mississippi crossing at New Orleans is to be a \$65 million part of a \$200 million bridge and expressway plan to unravel a difficult traffic situation in and around the city. It will provide for four traffic lanes and have an overall length of 2.3 miles, and will take motorists across the river to Algiers from an intersection with the Pontchartrain Expressway in New Orleans.

Pontchartrain Expressway is to be a \$33.2 million link between this river bridge and a 24.3-mile concrete causeway across Lake Pontchartrain. This \$53 million, two-lane causeway, itself a major structure, has been called the world's longest bridge. Its reinforced concrete trestle structure is of particular interest because it is being built by lifting total precast spans, 56 feet long and 33 feet wide, from barges onto pile bents. The precast concrete roadway structures as well as the hollow piles being used are of special interest to bridge engineers, inasmuch as both are prestressed. (Prestressing of concrete is basically the putting of artificial stresses into a structure as it is cast so that it will better resist the stresses under the loads it is designed to carry.)

Tappan Zee Bridge.—This is the major structure on the New York State Thruway, the 2.8-mile crossing of the Hudson River at Tappan Zee (widest spot on the river, between Nyack and Tarrytown). It was virtually completed in 1955, representing a \$60 million triumph in bridge building, and was opened to traffic on December 15.

Tappan Zee Bridge is most famous for its foundations, which cost only one third of the project's total price, despite very difficult river bottom conditions. These foundations, under the major piers, are buoyant, watertight concrete boxes, designed to carry by their buoyancy a portion of the load upon them. The mammoth boxes were built in dry-dock, towed to the site by tugboats, positioned, sunk, and eventually pumped dry to become submerged floats on which the great bridge rests. At its center the bridge has a 1,212-foot cantilever span which was floated into place and completed in mid-1955. Roadway paving operations on the six-lane structure were then rushed toward completion. The bridge totals 166 fifty-foot spans, seven 250-foot spans, two 600-foot spans, and thirteen 240-foot spans, in addition to the main span.

Kingston-Rhinecliff Bridge.—Steel erection on this high-level truss structure, serving as a Hudson River highway crossing, progressed steadily toward a November 1956 completion date. The \$19.3 million bridge will have a total length of 7,793 feet, and will serve as a toll facility to replace existing ferry service.

Richmond-San Rafael Bridge.—Crossing the northern arm of San Francisco Bay, this \$68 million bridge, with two steel cantilever spans, plus other truss and girder spans, will total four miles in length. It will have two separate levels, each carrying three lanes of traffic. One of its two major spans was completed in October 1955; the other was the only major steel erection work remaining unfinished. Each major span will provide

N.Y. STATE THRUWAY COMMISSION

New York Thruway bridge, spanning the Hudson River at the Tappan Zee, as it neared completion late in 1955.

a 1,000-foot wide channel. The west span will provide a 185-foot vertical clearance over the major shipping channel; the east span will clear a secondary channel by 135 feet.

A major feature of construction was the use of 280-foot aluminum falsework truss spans to support the bridge's steelwork during erection. One roadway of the double-decked bridge was scheduled to be opened for traffic by October 1956.

Delaware River Bridges.—Another major crossing of the Delaware was under construction in 1955, slightly more than three miles downstream from the Philadelphia-Camden Bridge. This is a \$90 million suspension bridge to have a center span of 2,000 feet and to carry seven lanes of traffic when opened early in 1957. Steel tower construction was the major building operation in 1955, the difficult dredged caisson foundation work having been completed previously. Foundations were constructed by first dredging up temporary sand "islands" as a work area for caisson and open cofferdam operations.

Completion was expected by the end of 1955 of the main span of the 6,571-foot bridge across the Delaware between Edgely, Pa., and Florence, N.J., which will connect extensions of the New Jersey and Pennsylvania turnpikes. The bridge will carry six road lanes, and its center span will be 636 feet long and clear the Delaware's high-water level by 135 feet.

Newark Bay Crossing.—An eight-mile extension of the New Jersey Turnpike, to connect it directly with the Holland Tunnel under the Hudson River to New York, has involved construction of a major high-level crossing of Newark Bay. This two-mile, \$40 million structure will carry six lanes of traffic when completed in 1956. The final link went into its main truss span in August 1955, 240 feet above the bay (see also **HIGHWAYS**).

Narrows Bridge.—What would be the world's largest suspension bridge, the Narrows crossing between Upper and Lower bays of New York City's harbor, remained in the planning stage during 1955. The \$204 million project would measure 7,200 feet between anchorages and have a main span 4,400 feet long—200 feet longer

than the Golden Gate Bridge. It would clear the water by 237 feet at mid-span.

This project, approved by the Department of Defense, was in 1955 part of a developing master plan of the Port of New York Authority and the Triborough Bridge and Tunnel Authority. Also included in this plan is double-decking of New York's George Washington Bridge at a cost of \$20 million, and paralleling, a mile upstream, the Bronx-Whitestone Bridge with a similar, \$93 million suspension bridge, to be known as the Throggs Neck Bridge.

Macdonald Bridge, Nova Scotia.—An \$11 million suspension span from Halifax to Dartmouth in Nova Scotia was completed in 1955. Known as the Angus L. Macdonald Bridge, it is 5,210 feet long, with a center span of 1,447 feet, and is second in length in Canada to the Lions Gate Bridge at Vancouver. There is 165-foot minimum clearance under the main span, and towers reach to 309 feet. The roadway is 27 feet wide. (See illustration under **NOVA SCOTIA**.)

Japan.—In Japan the world's fourth longest steel-arch bridge was opened to traffic early in 1955. Costing approximately \$1.5 million, it connects Nagasaki and Sasebo with a 1,042-foot arch which is 712 feet high at its center.

ARTHUR J. FOX, JR.,

Associate Editor, "Engineering News-Record."

BRITISH BORNEO. See **BORNEO**.

BRITISH CAMEROONS. See **CAMEROONS**.

BRITISH COLUMBIA. Most westerly of the Canadian provinces, British Columbia has an area of 366,255 square miles, and ranks third in size. Forming a part of the province are the Queen Charlotte Islands (3,866 square miles) and Vancouver Island (12,408 square miles). The estimated population as of June 1955 was 1,305,000, compared with 949,000 ten years earlier. A large part of the population is concentrated in and around the southern coastal cities of Vancouver (1951 pop., 344,833) and Victoria, the capital (51,331), whose metropolitan areas in mid-1955 contained populations of 624,000 and 121,000, respectively. Other chief urban centers and their 1951 populations include: New Westminster,

28,639; North Vancouver, 15,687; Trail, 11,430; and Penticton, 10,548.

Government.—British Columbia is represented in the Dominion Parliament by 6 senators (appointed for life) and 22 members of the House of Commons. The provincial government is administered by a lieutenant-governor and a Legislative Assembly of 48 members. A Social Credit government was re-elected in the most recent general election held on June 9, 1953. Party standings in 1955 were: Social Credit, 27; Co-operative Commonwealth Federation, 14; Liberal, 4; Labour, 1; and Independent, 1. There was 1 vacancy.

Education.—Education is compulsory for children between the ages of 7 and 15. During the school year 1953-54 there were 210,174 pupils enrolled in 1,027 public schools instructed by 7,574 teachers. In addition, there are a number of private institutions modeled on the English public school system. Higher education is provided by the University of British Columbia at Vancouver, which had an enrollment of 5,644 undergraduates during 1954-55. There are also two normal schools, a vocational institute, and a junior college.

Finances.—Estimated revenue for 1955-56 was \$194,522,469; estimated current expenditure, \$212,059,341.

Industries.—The four major industries of British Columbia yielded the following returns in 1954: forestry, \$528,022,783; mining, \$153,377,315; agriculture, \$140,206,635; and fisheries, \$69,400,000. The gross value of manufacturing production in 1954 was estimated at \$1,366,824,000.

Trade.—Exports and imports through British Columbia customs ports in 1954 were valued at \$692,239,650 and \$338,624,048, respectively. Exports of forestry products, such as lumber, newsprint, plywood, and related products, accounted for approximately 40% of the total. Steel products, lead, copper, zinc, apples, and fish were other leading commodity exports.

Transportation and Communications.—The province is crossed from east to west by two trans-continental railways, the Canadian Pacific Railway and the Canadian National Railway, both with terminals at Vancouver. The CNR also has a terminal at Prince Rupert. A provincially owned railway, the Pacific Great Eastern, operates a line running north and south from Squamish on the coast to Prince George in the interior. In 1955 the line was being extended from Squamish to Vancouver at the southern end. Current plans also called for a northern extension from Prince George to the Peace River area. During 1954, 12,359,945 tons of railway freight originated and 13,588,476 tons terminated in British Columbia. Railroad mileage as of Dec. 31, 1953, comprised 4,549 miles of mainline track and 1,226 miles of sidings.

Since World War II, British Columbia has spent many millions of dollars extending and improving its highway system, including nearly \$40 million during the fiscal year 1953-54. By March 31, 1954, exclusive of urban streets, there were 22,797 miles of highway in British Columbia, of which 11,693 miles were surfaced.

Air transportation connecting Vancouver and Victoria with other parts of Canada is provided by Trans-Canada Air Lines. In addition there are a number of interprovincial routes, and international connections. Ocean-going, coastal, and lake steamship services are provided by the ship services of the Canadian Pacific and Canadian National Railways, and the Union Steamship Company.

As of Dec. 31, 1954, there were approximately 363,032 telephone connections listed within the province.

Principal Events, 1955.—The approval of importation of natural gas by the U.S. Federal Power Commission on Nov. 25, 1955, opened the way for developing the natural gas fields in the

Peace River area, as the British Columbia demand for natural gas was not sufficient in itself to justify operations of a pipeline. The West Coast Transmission Company has already started the construction of the 650-mile, \$150 million pipeline from the Peace River block to Sumas on the British Columbia-Washington border. As it is anticipated that the British Columbia line will not be completed until 1957, it is expected that American natural gas will be piped into the province until the British Columbia line is completed.

A new surge in plans for the expansion of pulp and paper plants materialized in 1955. Major companies announced plans for: a 500-ton unbleached sulfate mill and expansion of present facilities (at a cost of \$28.5 million); a 250-ton sulfate mill, 180-ton multipurpose paper and board machine, and 300-ton newsprint mill (\$40 million); newsprint machines and modernization (\$20 million); a 250-ton Kraft pulp mill (\$25 million); and a 300-ton sulfate mill (\$30 million).

In an official ceremony on July 22, 1955, Grosvenor Estates, of London, officially opened the Annacis Causeway and Annacis Island. The island, with its 1,200 acres, is visualized as the future industrial hub of metropolitan Vancouver. The company was offering to build large or small industrial plants for tenants on long- or short-term leases.

The first steel pipe to be manufactured in western Canada was being tested prior to full-scale operation of the newly completed \$6 million plant at Port Moody of the Canadian Western Pipe Mills.

Another new industry for the province was promised by announcement that the Hooker Electro-Chemical Company was planning to build a chlorine-caustic soda plant on a 75-acre site in North Vancouver, at a cost of \$11 million.

For the first time in its history, British Columbia is to have its economic and social geography presented within a single volume. The publication, to be produced by the British Columbia Natural Resources Conference, of Victoria, will be issued in the form of an atlas containing 50 maps in full color, faced by illustrated pages of text.

G. T. HATCHER,

Director, Bureau of Economics and Statistics.

BRITISH COMMONWEALTH. See COMMONWEALTH OF NATIONS.

BRITISH EAST AFRICA. These British East African territories comprise, in continental Africa, the Uganda protectorate; the crown colony and protectorate of Kenya; the territory of Tanganyika, administered by Great Britain under United Nations trusteeship; and in the Indian Ocean, the protectorate of Zanzibar, comprising the islands of Zanzibar, lying about 22½ miles off the northeast African coast, and Pemba. The total area of the territories is 682,469 square miles; the population, 18,478,648 (1948 census).

Government.—The East Africa High Commission, consisting of the governors of Kenya, Tanganyika, and Uganda, assisted by the 23-member East Africa Central Legislative Assembly, administers specified common services, including railways, income tax, customs and excise, posts and telegraphs, civil aviation, and a defense force (the King's African Rifles). The establishment of the High Commission has involved no change in the constitution of the territorial governments, which remain responsible for basic services such

as administration, police, health, education, agriculture and forestry, labor, housing, and public works. Revenue of the High Commission is derived from contributions by the three governments and by Zanzibar; the United Kingdom contributes substantially to research and other services. The common currency is the East African shilling (equals U.S.\$0.14).

BRITISH EAST AFRICA

Territory	Area (sq. mi.)	Population (1948)	Capital
Kenya Colony and Protectorate . . .	224,960 ¹	5,405,966 ²	Nairobi (134,043) ³
Tanganyika Territory . . .	362,688 ⁴	7,850,000 ⁵	Dares Salaam (99,140)
Uganda Protectorate . . .	93,981 ⁶	4,958,520 ⁷	Entebbe (7,231) ⁸
Zanzibar Protectorate . . .	1,020 ⁹	264,162 ¹⁰	Zanzibar (45,284)
Total . . .	682,649	18,478,648	

¹ Land area, 219,730 sq. mi.; protectorate, 2,000 sq. mi.
² July 1, 1953, est., 5,800,000. ³ 1954 est., 186,000. ⁴ Inland water, 19,982 sq. mi. ⁵ 1955 est., 7,965,000, excluding non-African population. ⁶ Water area, 13,689 sq. mi.
⁷ 1954 est., 5,425,000. ⁸ 1951, 7,942. ⁹ Zanzibar, 640 sq. mi.; Pemba, 380 sq. mi. ¹⁰ 1952 est., 270,786.

The governors of the three mainland territories are: Kenya, Sir Evelyn Baring (sworn in Sept. 30, 1952); Tanganyika, Sir Edward Francis Twining (appointed June 18, 1949); Uganda, Sir Andrew Benjamin Cohen (sworn in Jan. 17, 1952). The British resident of Zanzibar is H. S. Potter (appointed Sept. 25, 1954). Constitutional changes increasing the participation of native populations in political affairs took effect in 1955. Parity of representation between the three main races was inaugurated in the Tanganyika legislature; in Uganda, reforms were approved affecting both the Executive and Legislative councils; and in Kenya, where the Mau Mau terrorist emergency has delayed constitutional progress, sanction was nevertheless given to the formation of political associations at district level, preliminary to the holding of national elections. Proposals under consideration in Zanzibar envisage an increased representation of native groups in both the Executive and Legislative councils. Major land reforms in East Africa were recommended by a British Royal commission in a report issued June 9, 1955.

KENYA

Formerly known as the East Africa protectorate, the Kenya crown colony comprises four provinces (Central, Coast, Nyanza, and Rift Valley) and three extraprovincial districts (Masai, Northern Frontier, and Turkana). Coastal territories rented from the sultan of Zanzibar form the Kenya protectorate, administratively part of the Coast Province. Chief towns are Nairobi, the capital; Mombasa, the principal harbor, and terminus of the Kenya and Uganda Railway; Kisumu, and Nakuru, capital of Rift Valley Province.

Government.—A Council of Ministers, inaugurated April 13, 1954, is the principal instrument of government, and consists of the deputy governor, a chief secretary, and 13 ministers (including 1 European and 1 Asian minister, both without portfolio) who together function also as an Executive Council. The Legislative Council, presided over by the governor, consists of 54 members (8 ex-officio ministers; 18 nominated members; 14 European elected members; 6 Asian elected members; and 1 Arab and 6 African representative members). With the reduction of Mau Mau terrorism, the formation of a new political organization for Africans, preparatory to the election of national officials in 1956, was under consideration by the Council of Ministers.

Mau Mau Terrorism.—Although confined to the Aberdare and Mount Kenya forest areas, terrorist activity continued on a limited scale during 1955. New surrender terms involving no penalty were announced by the governor at a rally of loyal tribesmen at Nyeri, on Jan. 18, 1955, but were withdrawn on July 10. Surrender passes were widely scattered from airplanes, which flew low over the forests repeating the amnesty offer over loud-speakers. By June 8, 650 terrorists, including 20 gang leaders, had

BRITISH INFORMATION SERVICES

Two Mau Mau terrorists are captured by British white hunters in Kenya Colony back country, British East Africa.

given themselves up, and 1,499 terrorists had become casualties. From the beginning of the emergency, proclaimed on Oct. 21, 1952, to Oct. 20, 1955, 9,802 terrorists had been killed, 2,009 captured, and 2,009 surrendered. Some 1,462 civilians and 541 members of government security forces had been killed by June 8, 1955.

Talks initiated by Mau Mau leaders to arrange mass surrenders broke down, however, and it was announced that military operations would therefore continue under Maj. Gen. Gerald W. Lathbury, appointed Jan. 10, 1955 (with temporary rank of lieutenant general) as commander in chief in East Africa, effective from May. Although between 3,000 and 7,000 terrorists remained at large in July 1955, police and administration security forces were considered strong enough to resume responsibility in all districts except in the prohibited areas, without assistance from the army, whose forces were to be progressively reduced.

Education.—In 1954 there were 314 government schools. Other schools included 18 European, 318 Asian, 256 African, and 9 Arab institutions; also 17 teacher-training centers and 6 African technical and vocational training centers. There were also 2,338 government-aided schools (14 European, 83 Asian, 1 Arab, and 2,240 African, including 40 African teacher-training centers). Private institutions numbered 1,192 schools (11 European, 9 Asian, and 1,172 African), exclusive of nursery schools.

Finance.—In April 1955, the Kenya government budget showed a deficit for 1955–56 of £14.7 million. With proposed increased duties and taxes, the estimated deficit would be reduced to £13.4 million, bringing the total estimated deficit on exchequer account to nearly £20 million, including a deficit for 1954–55 of £6.26 million. This was to be met in part by a British government grant of £10 million (authorized in February 1955). Up to February 1955 the United Kingdom had made available £11.5 million for emergency expenditure.

Production.—Coffee is Kenya's most valuable crop. Also grown in the highlands and Nyanza province are maize (corn), wheat, wattle, tea, and pyrethrum; elsewhere production of cotton, sugar, coconuts, beans, and peanuts is important. Podocarpus and other timbers are produced in a forest area of 6,916 square miles. Principal agricultural and forest products in 1954, and their value, were: coffee, 10,801 tons (£5,726,824); cotton, 61,002 cwt. (£796,041); corn, 918,332 cwt. (£1,013,192); sisal, 32,232 tons (£2,041,563); tea, 96,800 cwt. (£2,062,654); wattle extract, 24,204 tons (£1,668,037); hides and skins, 120,984 cwt. (£1,836,576); and sawn podocarpus, 69,300 cubic feet (exported). Principal mineral products, and their value in 1953, were: gold, 9,603 troy ounces (£122,801); soda ash, 76,032 tons (£790,732); salt, 20,886 tons (£164,439); and kyanite and mullite, 5,434 tons (£129,992).

Foreign Trade.—The total value of Kenya's imports was £60.1 million in 1954; exports, £22.8 million. Principal exports included gold, coffee, tea, raw cotton, hides and skins, lumber, and sisal fiber and tow. Imports included principally cement, cotton piece goods, piece goods of synthetic fibers, iron and steel, metal manufactures, machinery, automobiles, and commercial vehicles.

Communications.—About 1,670 miles of railway are operated in Kenya and Uganda, the main line extending from Mombasa through Nairobi, 879 miles to Kampala in Buganda Province. Kenya has approximately 20,500 miles of first-class bitumen-surfaced highways, secondary roads, and motor tracks. Eastleigh is the principal airport used by international services at Nairobi. From Nairobi West

Airport internal services are operated to Mombasa, Kisumu, Eldoret, and Kitale, as well as connecting services to neighboring territories.

TANGANYIKA

Mandated to Great Britain after World War I, this former German East African territory has been administered since 1946 by Great Britain as a United Nations trusteeship territory. In its total area (362,688 square miles) are counted 19,982 square miles of lakes, including Lake Tanganyika (12,700 square miles) through which the border with the Belgian Congo passes. The chief coastal towns are Dar es Salaam (the capital), Tanga, Mtwara, Lindi, and Kilwa. The African population, estimated at 7,965,000 in 1955, consists of over 100 tribes, mostly of mixed Bantu origin.

Government.—Tanganyika is administered by a governor, assisted by an Executive Council of 3 ex-officio, 5 official, and 6 nonofficial members. The Legislative Council, presided over by a speaker, has a membership of 61; the official bench numbers 31 (17 government officials, and 14 nonofficials), the government having thus an official majority of 1. Beginning with the legislative session commencing April 19, 1955, the nonofficial bench of 30 included 10 members of each of the three main races.

The territory is divided into 8 provinces: Central, Eastern, Lake, Northern, Southern, Southern Highlands, Tanga, and Western, and 56 districts. To a growing extent government policy is implemented by county councils, town councils, township authorities, or other native authorities. All races are represented on local government bodies.

Finance.—Revenue of the territory for the fiscal year 1955-56 was estimated to be over £24 million, with expenditure slightly higher. A budget deficit of £135,970 was anticipated as of June 30, 1956. Tanganyika continued to benefit from allocations under the British Colonial Development and Welfare Act.

Education.—Expenditure on African education in 1954 was £2,733,885. In 1954 there were 593 government and native authority African primary schools, with a total of 74,733 pupils, and 1,543 voluntary agency assisted primary schools, with an enrollment of 195,882 pupils. There were 305 postprimary schools, 90 managed by government or native authorities, and 215 by voluntary agencies (enrollment, 10,909, and 20,468 respectively); and 4 government Asian schools (enrollment 3,913) and 105 assisted Asian schools (enrollment 13,250). In addition there were 9 government European schools, and 18 assisted European schools (aggregate enrollment, 1,963).

Production.—The economy is primarily agricultural, devoted largely to the cultivation of subsistence cereals and other food crops. Industry other than mining is mainly concerned with the processing of primary products. Secondary manufacturing industries include the canning of meat, fruit, and vegetables; paint; metal containers; coir matting; macaroni; and bleaching and dyeing of textiles.

A feature of economic development has been the growth of the cooperative movement, which has become well established among African coffee producers around Mount Kilimanjaro, and which handles all African-produced coffee, amounting to over 19,000 tons annually. A large proportion of the cotton crop of the Lake Province is also handled by cooperatives. The Tanganyika Agricultural Corporation, which came into being March 30, 1955, was continuing the experimental tenant farming started at Nachingwea by the Overseas Food Corporation.

Foreign Trade.—The value of principal exports, other than mineral, in 1954 was: sisal, £10,902,033; coffee, £10,002,726; cotton, £3,356,844; and hides and skins, £1,529,029. In 1954 a new record was established in the value of mineral production, which reached £5 million. Principal minerals exported were: diamonds, £3,107,241; gold, £891,807; and lead concentrates, £360,000. A large pyrochlore (columbium oxide) orebody was discovered near Mbeya.

Communications.—The territory has 1,568 miles of railways comprising the Tanga line (272 miles), Central line (1,064 miles), and Southern province line (132 miles). New roads were recently completed between Dar es Salaam and Morogoro, and between Tanga and Korogwe; the new Morogoro-Iringa road was expected to be opened by October 1956. British Overseas Airways maintain a weekly direct service from Dar es Salaam to London. Internal air services connect the main administrative and commercial centers throughout East Africa, and there are external services to Nyasaland, Northern and Southern Rhodesia, Portuguese East Africa, the Belgian Congo, and the Union of South Africa.

UGANDA

The area of the protectorate (93,981 square miles) includes the northern half of Lake Victoria (13,689 square miles) from which the Nile begins its course to Nimule in the Anglo-Egyptian Sudan. The population, which by 1954 numbered 5,425,000, included at the

latest census 4,917,555 Africans, among which were 850,000 Baganda, the principal tribe, from which the protectorate takes its name, and which is recognized as a native kingdom. Chief towns are Entebbe, headquarters of the administration, Kampala, the principal commercial center, Jinja, and Fort Portal.

Government.—Uganda comprises Buganda, Eastern, Western, and Northern provinces. Changes in structure of both the Executive and Legislative Councils were approved in July 1955. By these changes the Executive Council consists of 15 members, and the Legislative Council, 60 members. A kabaka (or king) rules in Buganda with the assistance of native ministers and a Lukiko, or native assembly. Kabaka Mutesa II, who was removed from his throne and exiled in London in November 1953, was permitted to return in 1955. He resumed his reign as a constitutional monarch after signing a new administrative agreement at Kampala on Oct. 18, 1955. Under the new agreement, indirectly elected representatives of Buganda were to be included for the first time among the 30 African members of the Uganda Legislative Council. Local powers of the kabaka were to be exercised by a Council of Ministers. The expulsion was ordered on March 31, 1955, of most Kikuyu, Meru, and Embu tribesmen, to prevent the infiltration of Mau Mau terrorists into the protectorate.

Finance.—Revenue for the fiscal year 1954-55 was estimated at £18,543,451; expenditure, £18,724,464 (since 1954 the fiscal year runs from July 1 to June 30). Revenue for 1955-56 was estimated at £17,063,063; expenditure at £17,055,462.

Education.—The majority of the African schools are managed by religious voluntary agencies; administration of Asian schools is shared between government and local communities. Primary education is provided for European children in the big towns. At the end of 1954 there were 1,700 grant-aided primary schools (231,000 pupils), and 150 grant-aided secondary schools (16,000 pupils). The number of unaided schools exceeded 2,000, with an estimated school population of 300,000. At the beginning of 1955 there were also 38 teacher-training colleges (3,184 students), which had trained 919 teachers in 1954. The University College of East Africa at Makerere (Kampala) furnishes facilities for all the East African territories.

Production.—Cotton is grown in Uganda entirely by African farmers; acreage in 1953-54 totaled 1,174,838, the crop amounting to 398,000 bales of 400 pounds each. Other principal production (1953-54 season) included coffee, 40,000 tons; and in 1954: tea, 6,233,217 pounds; tobacco, 1,980,000 pounds of cured leaf; hides, 1,879 tons; goat skins, 932,000; and sheep skins, 77,000. Maize (corn) totaling 85,000 tons was marketed in 1954. Mineral production included in 1954: tin, £57,061; tungsten, £140,741; and tantalite columbite, £20,123. Copper deposits are to be exploited at Kilembe, at the foothills of the Ruwenzori (Mountains of the Moon).

Foreign Trade.—There was again a favorable balance of trade in 1954. Exports totaled £40,574,810; imports, £25,198,645. Exports to Commonwealth countries came to £26,488,088 in 1954. Among non-Commonwealth countries, the United States took goods worth £3,006,294. Imports from Commonwealth countries amounted to £15,736,898; from the United States, £810,323. Values of principal exports were: cotton, £20,877,000; coffee, £13,478,000; animal feeds, £1,593,000; oilseeds, £977,000; tea, £950,000; and hides and skins, £752,000.

Communications.—The Public Works Department maintains 2,900 miles of all-weather roads, and 200 miles of two-lane bitumenized highways. The Buganda and African local governments maintain an additional 8,300 miles of road, toward which current grants totaling £96,000 were made by the protectorate government. There were 21,106 registered motor vehicles in 1954. At Entebbe there is a first-class international airport used extensively by British Overseas Airways en route to South Africa, by Air France, Sabena, and other international services, and by East African Airways. Landing strips are maintained at 16 other centers in the protectorate.

ZANZIBAR

This largest coral island on the East African coast, separated from the mainland by a channel of about 22½ miles at its narrowest point, constitutes with Pemba and adjacent small islands a protectorate, administered by Great Britain since 1891 under a sultan (Seyyid Sir Khalifa bin Harub, acceded Dec. 9, 1911). The indigenous population is principally African (199,860 at 1948 census), Arabs numbering 44,560, and Indians, 15,892. Most of the natives are Moslems.

The British resident is assisted by an 8-member Executive Council, presided over by the sultan; and a Legislative Council of 9 official and 8 nominated non-official members. Under proposals advanced by the administration in 1955, the sultan would withdraw from the Executive Council to become head of a privy council and the Executive and Legislative councils would be expanded to include additional native members.

Finance.—The ordinary budget showed a total revenue in 1954 of £2,652,317; expenditure, £2,391,241. Up to 1954, Zanzibar had received grants totaling £1,390,087 under the Colonial Development and Welfare Act.

Education.—Under a revised development plan, £264,257 was expended on education in 1954. There were 61 public schools (pupil enrollment, 11,824); 4 independent schools (enrollment, 354); and 2 teacher-training centers.

Production.—Zanzibar's agricultural industry centers around clove production; copra (for export and local use in soap manufacture) is next in importance. Livestock is raised, and fisheries are a valuable resource. Other principal exports are chilies, fresh fruits, hides and skins, marine shells, and coir fiber. Rice and cassava are cultivated as subsistence crops.

Foreign Trade.—Total imports (more than half of which came from the United Kingdom and other Commonwealth countries) were valued at £5,877,454 in 1954. Exports (of which 53% went to Commonwealth countries) totaled £6,429,287 in 1954. The export clove crop was valued at £4,031,946; other principal exports were: clove oil, £143,850; coconut oil, £410,251; and copra, £404,735.

DONOVAN ROWSE,
Author and Publicist.

BRITISH GUIANA. This British crown colony (area, 83,000 square miles) is situated on the northeast coast of South America, with Surinam on the east, Venezuela on the west, and Brazil on the south and west. Its three administrative counties are named after the principal rivers: Berbice, Demerara, and Essequibo. The population was estimated at 465,416 in 1953, of which 215,260 were of East Indian descent, and 162,700 of African origin. The capital is Georgetown (pop., 87,279 in 1953); other towns include New Amsterdam, Mackenzie, Springlands, and Bartica. A United States naval base at Makouria and a United States military base on the Demerara River are de-activated, the latter now being operated as a civil airport (Atkinson Field).

Government.—Under a British order in council made on Dec. 22, 1953, following political disturbances which had resulted in the suspension of the newly inaugurated constitution, the governor (Sir Alfred W. S. Savage, appointed Sept. 18, 1952) heads an interim government which since January 1954 has comprised a wholly nominated 27-member Legislative Council and a 10-member Executive Council, all of whom are members of the Legislative Council. Opening the council's second session on April 22, 1955, the governor declared that in spite of "difficulties, hindrances, misrepresentations, and threats against security," British Guiana generally had recovered its self-respect and confidence. Earlier, a commission appointed by the British secretary of state for the colonies, which visited British Guiana in 1954, had recommended that the interim government should continue for four years beginning Jan. 1, 1954.

Finance.—The British West Indian dollar equals U.S.\$0.5833. The 1955 budget (the largest in the colony's history) provided for current expenditure of BWI\$37,583,000—an increase of nearly BWI\$6 million over 1954. After modifications in the tax structure, a revenue surplus of BWI\$479,000 was expected.

A development plan for 1955 provided BWI\$16 million for economic development and BWI\$4 million for housing, health, and education. Within its first year of operation (to June 1955) the British Guiana Credit Corporation had approved loans totaling BWI\$4,442,400, the largest part of which was for housing, and the remainder to assist food production and agricultural and industrial projects.

Education.—Public schools receiving government aid in 1953 numbered 321, including 6 nursery schools. Educational enrollments included 84,091 primary pupils; 2,506 secondary and vocational students; and 16 teacher-training students. There were 1,914 indigenous teachers, and 43 nonindigenous teachers at work in public schools. Facilities for secondary education include Queens College for boys, and Bishop's High School for girls.

Economy.—In spite of bad weather conditions the economically important sugar crop amounted to 238,922 tons in 1954, compared with 238,700 in 1953. Sugar exports, having a value of BWI\$34,464,354, totaled 244,000 tons for the first 10 months of 1954, exceeding by 2,000 tons the record export total of the full year 1952. Production of rice in 1954 was 71,000 tons (75,600 in

1953) and of bauxite, 2,310,000 tons (2,274,600 in 1953). Exports of these two commodities during the first 10 months of 1954: 36,700 tons of rice worth BWI\$7,370,858, compared with 39,400 tons during all of 1953; and 2,126,000 tons of bauxite valued at BWI\$19,753,562, against 2,115,000 tons in the full year 1953. Bauxite shipments valued at BWI\$14,866,571 went to Canada during the first 10 months of 1954. Other British Guiana exports include lumber, gold, and diamonds. Total imports in 1954 were valued at £16.7 million; exports, £17.8 million.

Communications.—The colony maintains 317 miles of motor roads and 239 miles of forest roads; there are 268 miles of trails. The government owns and operates 95 miles of railroads. British West Indian Airways and Pan American Airways maintain external services; internal services are operated by British Guiana Airways. Motor vehicles in 1954 numbered 7,710.

Principal Events, 1955.—The United Kingdom adopted on Aug. 2, 1955, the recommendations for reform and extension of local government in British Guiana contained in a report by Dr. A. H. Marshall, who spent three months in the territory on an inquiry into all aspects of the existing system. The pattern of local government covers only about half the population, according to the Marshall report. Its main proposal is that the whole of the coast lands (containing nearly 90 per cent of the population) should be constituted a single-tier system, involving the establishment of 18 rural district councils. These bodies, composed of 24 members each (some nominated for the first term, but afterwards elected), would take over the work of existing authorities and assume additional responsibilities for social welfare and agricultural education. Three temporary local government commissioners were being selected for appointment to the staff of the minister of local government, and a permanent local government service was to be established, operating on the lines of the Public Service Commission.

The governor announced in April 1955 that steps were under consideration to relax the ban on public meetings imposed at the suspension of the constitution. Discussion would thus be possible of important current issues, specifically, that of British Guiana's participation in the British Caribbean Federation. By majority vote in April the Legislative Council approved this step in principle, recommending further study of the question.

A major drive to complete contracts awarded in 1954 under the plan to provide 4,500 low-cost houses for lower income groups at an estimated cost of BWI\$12.3 million, was made by the Housing Department in 1955. Seven additional government-aided, self-help housing projects were established.

DONOVAN ROWSE,
Author and Publicist.

BRITISH HONDURAS. This British crown colony (area, 8,867 square miles) having a coast on the Caribbean Sea, is bordered also by Mexico and Guatemala. Its population, made up of Negroes, Maya Indians, Hispano-Indians, Caribs, and Europeans, is 78,094 (est., 1954). The capital and chief port is Belize (est. pop., 27,500).

Government.—There are six administrative districts: Belize (1,623 square miles), Corozal (718), Orange Walk (1,830), Cayo (2,061), Stann Creek (840), and Toledo (1,795). A governor and commander in chief (Sir Patrick M. Renison, appointed March 1952) is chairman of a 10-member Executive Council, including 6 elected nonofficials, and is assisted also by a 15-

member Legislative Assembly. Eight of the assembly's 9 nonofficial elective seats are held by the anticolonial People's United Party (PUP). Government revenue totaled BH\$5,330,232 in 1954; expenditure, BH\$5,339,679. (The British Honduras dollar equals 70 U.S. cents.)

Education.—In 1954 there were 2 government, 93 government-aided, and 27 nonaided private primary schools (15,066 pupils, 500 teachers); 1 government technical high school; 8 private secondary schools (1,194 pupils, 63 teachers); and 1 government teacher-training college. Expenditures on education in 1954 totaled BH\$432,026.

Economy.—Principal crops (and acreages in 1954) are corn (15,500), beans (3,000), coconuts (7,700), sugarcane (5,000), rice (2,600), root crops (1,500), and citrus fruits (5,000). Products from forest lands (8,331 square miles) include mahogany, cedar, pine, Santa Maria timbers, and chicle. Exports and re-exports in 1954 totaled BH\$7,287,826. Exported domestic produce totaled BH\$6,226,568, including timber, BH\$3,376,340; chicle, BH\$1,009,359; and citrus fruits and products, BH\$1,115,482. Exports went chiefly to Great Britain (BH\$2,602,392, or 41.8%), Jamaica, BWI (BH\$1,344,356), and the United States (BH\$1,209,468, or 19.4%). Imports in 1954 totaled BH\$11,409,568, of which BH\$10,890,444 represented domestic consumption, and included oils and petroleum, flour, cotton piece goods, machinery, rice, and fats. Principal sources were Great Britain (BH\$4,011,465), Trinidad, BWI (BH\$795,136), the United States (BH\$3,807,553, or 33.4%), and the Netherlands (BH\$702,338).

There are 411 miles of motor roads. Four major airlines operate scheduled services to Stanley Field, 10 miles west of Belize.

Principal Events, 1955.—A constitutional advance was inaugurated Jan. 1, 1955, when three nonofficial members of the Executive Council, each with an associate member, were appointed to the Natural Resources, Public Utilities, and Social Services departments, as a first step toward ministerial government.

Parts 1 and 2 of the government development plan were scheduled for completion by 1956. An effort was begun to re-establish banana production in new areas, disease having ravaged the crop in present locations. Drilling of test wells was begun by an oil company.

BRITISH WEST AFRICA. These British possessions on the west coast of Africa comprise the colony and protectorate of Nigeria (constituting since 1954 a federation under a governor general), with which is administered the trust territory of British Cameroons; the Gambia colony and protectorate; the Gold Coast colony, to which are attached Ashanti and the Northern Territories and Togoland trust territory; and the colony and protectorate of Sierra Leone. The aggregate area of British West Africa is 496,295 square miles; its population, 39,546,021.

The heads of government in British West Africa are: Sir James Robertson, governor general and commander in chief of the federation of Nigeria (appointment announced April 9, 1955); Sir Percy Wyn Harris, governor of Gambia (appointed Aug. 5, 1949); Sir Charles Arden-Clarke, governor of the Gold Coast (appointed June 29,

1949); and Sir Robert de Zouche Hall, governor of Sierra Leone (appointed December 1952). Currency in circulation is interchangeable with sterling at par.

¹ In 1951; mid-1953 census est., 27,500. ² Mid-1953 census, excluding about 15,000 seasonal immigrants. ³ Partial census, 1947-48; mid-1952 est., 2,000,000, including colony. ⁴ 1948 census; mid-1955 est., 4,619,000 (Togoland, 423,000). ⁵ Former Lagos colony, now administered as a province. ⁶ Mid-1953 est., 31,500,000; 1953-54 census: Northern Region, 16,840,479; Western, 6,087,917; Eastern, 7,217,829, excluding Southern Cameroons. ⁷ Mid-1953 est., 1,500,000.

Government and Political Events, 1955.—The first session of the new federal House of Representatives of Nigeria was opened on Jan. 12, 1955, under the constitution which came into force on Oct. 1, 1954, and following elections held under varying systems between October 1954 and January 1955. Each of the three principal political leaders took office as prime minister of one of the regions; they were: Northern Region, the Sardauna of Sokoto; Western, Obafemi Awolowo; and Eastern, Dr. Nnamdi Azikiwe. The 184 elected members comprised: Northern People's Congress, 79; National Council of Nigeria and the Cameroons, 56; Action Group (United National Independence Party Alliance), 27; Kamerun National Congress, 6; and others, 16.

The Gambia Executive Council was formed with an elected majority for the first time, and with three nonofficial members as ministers.

In a speech prepared by the Gold Coast ministers and delivered by the governor at the opening session of the Legislative Assembly on Feb. 15, 1955, the hope was expressed that ultimate full independence from Great Britain would be achieved within the life of the present assembly.

The West African Interterritorial Conference, dealing with matters of common interest to the four territories, comprises two members each of the Central Council of Ministers of Nigeria, the Gold Coast cabinet, and the executive councils of Sierra Leone and Gambia. Its third session was held at Accra, Gold Coast, in January 1955.

NIGERIA

The colony and protectorate are administered in three regions comprising 27 provinces. British Cameroons, under United Kingdom trusteeship, became an administrative part of Nigeria in 1946 (see CAMEROONS). Under a new constitution effective Oct. 1, 1954, the Council of Ministers comprises the governor general as president, 10 ministers (3 from each region, and 1 from the Southern Cameroons), and 3 ex-officio members. The House of Representatives consists of the speaker and

184 elected members. Each region has its own Executive Council. Elected Nigerians comprise the majority of both central and regional legislative bodies.

Largest towns (and their populations in 1952-53) include Ibadan (459,196), Lagos (the capital, 271,800), Ogbomoso (139,000), Kano (130,173), Oshogbo (123,000), Ife (111,000), and Iwo (100,000). Besides Lagos, ports on the Gulf of Guinea include Port Harcourt, Calabar, and Tiko.

Finance.—The budget provided for estimated revenue of £54.27 million in 1955-56, of which £22.86 million would be expended on grants to the regional governments. Against the remaining £31.41 million, true federal expenditure will total some £29.44 million. On March 31, 1955, the general revenue balance was estimated at £24.38 million.

Education.—Total estimated expenditure on education in 1953-54 was £4,406,540. There were 37 primary and 11 secondary schools and 17 teacher-training colleges maintained by the government, and 1,105 primary schools, 14 middle schools, and 17 teacher-training centers conducted by native authorities. Many additional schools are maintained by Christian missionary bodies. Provisional enrollment figures in 1953 showed a total of 1,119,400, including 1,094,200 primary and 17,100 secondary pupils.

Economy.—In 1954 the value of Nigerian exports was £149 million; imports, £114 million. Principal exports included coal, 25,600 tons (from production of 636,000 tons); tin concentrates, 7,480 tons; peanuts, 428,000 tons; palm oil, 208,000 tons; palm kernels, 464,000 tons; bananas, 182 million pounds; cocoa, 98,000 tons; raw cotton, 58,100,000 pounds; hides and skins, 167,700 cwt.; and timber, 10,029,000 cubic feet. Major imports included cement, cotton piece goods, iron and steel, machinery, and commercial vehicles. Cotton production rose to an estimated 85,000 tons in 1954-55. Production of columbite (for which the United States government has large contracts with Nigerian producers) increased to 2,914 tons in 1954, and was expected to be still larger in 1955 with the exploitation of new deposits.

Communications.—Principal inland waterways are the Niger and its principal tributary, the Benue. There are 28,807 miles of road (bituminous-surfaced, 1,631 miles). An autonomous corporation was to be established in 1955 to take over the government-operated Nigerian Railway, covering over 2,200 miles, and connecting Nguru and Kano in the north with Lagos and Port Harcourt in the south. Kano, Lagos, and Maiduguri have international airports; West African Airways maintains internal services at 15 other airfields.

GOLD COAST

The prime minister and 10 other ministers comprise the cabinet; the all-African Legislative Assembly is composed of 105 members, including a speaker elected by (but not a member of) the assembly (see above, *Government and Political Events*).

Finance.—For the fiscal year 1954-55, revenue totaled £80,567,534 and expenditure, £79,860,268, including £46,551,092 transferred to development funds.

Education.—In 1953-54 the government spent £5,763,065 on educational facilities, including the Kumasi College of Technology and the University College of the Gold Coast. In January 1954 there were 3,271 primary schools (403,201 pupils), 864 middle schools (104,585 pupils), 3 government trade schools (402 pupils), and 3 technical institutes in the Gold Coast and Togoland. Government and assisted secondary schools numbered 31, with 6,936 pupils; there were some 33 private secondary schools (about 1,666 pupils).

Economy.—The Gold Coast produces nearly one third of the world's output of cocoa; 214,148 tons were exported in 1954 at a value of £84,598,864. Other export crops include kola nuts, copra, and palm kernels. Principal exports in 1954, besides cocoa, included 787,874 fine ounces of gold (£9,822,320), 460,245 tons of manganese (£5,137,713), 2,125,708 carats of diamonds (£4,272,684), and 17,847,376 cubic feet of lumber (£6,680,296).

Total exports and re-exports in 1954 were valued at £114,673,025; imports, £71,154,510.

Communications.—In 1955 mileage of roads suitable for motor vehicles totaled 7,496. Railway mileage totaled 549, including 45.5 miles opened in 1954 to serve a new harbor at Tema; total trunk mileage was 675 miles; 4,803,051 passengers and 1,612,679 tons of freight were carried in 1954-55. The international airport at Accra serves British Overseas Airways, Pan American World Airways, Air France, and other airlines.

SIERRA LEONE

Under the constitution of 1951 the governor is assisted by an Executive Council of 4 officials and 6 non-official members; the chief minister is chosen from the elected members of the Legislative Council; and 5 ministers are responsible for various departments of government. The Legislative Council comprises 7 officials and 23 nonofficial members (21 elected, 2 nominated). Sev-

UNITED PRESS

Nigerian natives on goodwill mission to the United States visit New York City on Aug. 31, 1955.

eral measures giving new functions and wider responsibilities to local bodies came into effect in 1955. District councils were able to have elected or nonofficial presidents, and the first town council in the provinces came into operation at Bo.

Finance.—Revenue of the central government totaled £7,621,299 in 1954; expenditure, £6,863,115.

Education.—In 1954 there were 372 primary schools (46,577 pupils); 20 secondary schools and postprimary departments (4,369 pupils), 19 of which were maintained or assisted by the government; 4 teacher-training colleges (2 maintained by the government, 2 assisted mission institutions); 2 assisted mission teacher-training departments; and a technical institute (500 pupils).

Economy.—More than half the population is engaged in agriculture. Mechanical cultivation projects developed under the 5-year agricultural plan include those in the Bonthe-Pujehun and Northern Boli lands, where production was expected in 1955 to be between 5,000 and 7,000 tons of paddy from between 10,000 and 13,000 acres. Food production, however, has fallen off because of neglect resulting from the attraction of illicit diamond digging, which has also affected production in the mining industry. Sierra Leone's harvests in 1954 included rice paddy (220,000 tons, grown on 640,000 acres), millet and sorghum (26,000 tons, grown on 78,000 acres), palm oil (29,000 tons), cocoa (1,738 tons), and coffee (2,500 tons). Livestock production totaled an estimated 100,000 head of cattle. Forest industries produced 223,556 cubic feet of round and sawn timber.

Mineral production included iron ore (877,306 tons), chrome ore (15,120 tons), diamonds (443,598 carats), and gold (2,530 troy ounces).

Exports totaling £11,398,305 included palm kernels (68,080 tons, valued at £3,763,924); iron ore (877,306 tons, £2,707,324); diamonds (443,598 carats, £1,699,875); and cocoa, unroasted coffee, ginger, and piassava. Imports, valued at £13,376,250, included principally cotton fabrics (£1,832,733), iron and steel, and base metals (£685,824).

Communications.—The first of 11 new major road bridges, to replace ferries, was to be opened in 1955. Railway mileage totaled 394 in 1954; there were 2,912 miles of highways (bituminous-surfaced, 103 miles). The harbor of Freetown is one of the finest in Africa; over 600 ships called in 1954, and 270,782 tons of cargo was handled. There is an international airport at Lungi, near Freetown, at which services are maintained by Air France and West African Airways. Reconstruction of the runway was to be completed in 1955.

GAMBIA

The colony is administered by an Executive Council, consisting of the governor, 4 ex-officio members, 1 official member, and 7 appointed members. For the first time in Gambia's history there was in 1955 not only a

nonofficial majority on the Executive Council, but three of its nonofficial members were ministers. The first meeting took place in December 1954 of the newly-constituted Legislative Council, which consists of the governor as president, a speaker, 4 ex-officio members, 1 nominated official member, 2 nominated nonofficial members, and 14 elected members.

Finance.—In 1954 revenue totaled £1,420,356; expenditure £1,168,309. The estimates for 1955 anticipated revenue of £1,517,830; expenditure, £1,588,297.

Education.—In 1954 there were 44 government and mission primary schools (4,851 pupils), and 5 secondary schools (609 pupils); the government spent £93,085 on education.

Economy.—Production of palm kernels and of hides and skins is second in importance to peanuts (47,260 tons exported in 1954). All exports totaled £3,046,024 in 1954; imports, £2,595,256.

Communications.—The Gambia River affords the principal means of communication. There are 37 miles of surfaced roads in and about Bathurst, and all-weather roads connect Barra and Karang on the route to Dakar, and Brikama and Seletu on the route to Ziguinchor. West African Airways operates services from Yundum Airport, connecting Bathurst with Freetown, Sierra Leone, and Accra, Gold Coast.

Author and Publicist.

BRITISH WEST INDIES. Six groups of islands in the Caribbean constitute these nine British colonies (four of them known collectively as the Windward Islands), with an aggregate area of 12,447 square miles and a population of 2,918,446. The Bahamas are considered geographically, though not politically, a part of the West Indies.

Colony	Area (sq. mi.)	Popula- tion	Capital
Bahamas.....	4,404	92,598 ¹	Nassau

Leeward Islands.....	422	126,251 ⁵	St. John's
Trinidad and Tobago.....	1,980	678,300 ⁶	Port of Spain
Windward Islands.....	821	251,771 ⁷	St. George's
Total.....	12,467	2,918,446	

¹ 1954 est. ² 1953 est. ³ Colony, 4,411 square miles; dependencies: Turks and Caicos Islands (170 square miles); Cayman Islands (93 square miles). ⁴ Provisional est., 1954 (colony, 1,531,933; Turks and Caicos Islands, 7,000; Cayman Islands, 7,651). ⁵ 1954 est. ⁶ 1953 est. ⁷ At latest (1946) census.

The colonies of British Guiana and British Honduras, on the American mainland, have voted against participation in the projected British Caribbean Federation, but in 1955 the British Guiana interim government approved the principle of federation and decided on further study of its relation to the federal plan.

The legislatures of Barbados, Jamaica, Leeward Islands (excepting the British Virgin Islands), Trinidad and Tobago, and Windward Islands having adopted federation, the secretary of state for the colonies, A. T. Lennox-Boyd, announced on Feb. 2, 1955, that the United Kingdom government would designate the controller for development and welfare in the West Indies (Sir Stephen Luke) as commissioner for the preparation of the federal organization. Three commissions would be appointed to work out fiscal, civil service, and juridical arrangements, in cooperation with the territorial governments and with such regional bodies as the Regional Economic Committee. Constitutional instruments would provide that British Honduras, British Guiana, and any other territory would be free if they wished to join the federation.

Intercolonial migration within the federated area was the subject of a conference at Port of Spain, Trinidad, March 14-17; recommendations of the conference were to be embodied in the final plan of federation. When this had been approved, and Parliament had passed the necessary legislation, prefederal machinery was to be established and arrangements made for the demarcation of constituencies and the holding of elections. The end of 1956 has been set as a target date for the creation of a federal government in the Caribbean. All the British Caribbean territories sent representatives to a conference on training in administration held in April 1955 at the University College, Jamaica.

Under the new Colonial Development and Welfare Act, effective March 29, 1955, allocations of funds to Caribbean territories totaled £13,560,000, exclusive of £4,619,000 representing unspent balances of previous allocations.

Princess Margaret, younger sister of Queen Elizabeth II, made a month's official tour of the West Indies from Feb. 1 to March 2, 1955, traveling between the islands on the royal yacht *Britannia* and being warmly received throughout the colonies.

To assist in relieving distress caused by hurricanes which caused heavy casualties and damage (especially in the Windward Islands) in September 1955, the United Kingdom government made grants of £50,000 each to the governments of Barbados and Granada, and of £10,000 to British Honduras.

(For particulars of government, education, trade, and communications, see the articles on the various colonies.)

BRONZE. See BRASS AND BRONZE.

BROWNELL, Herbert, Jr., U.S. attorney general: b. Peru, Nebr., Feb. 20, 1904. With a background in law and New York State politics, he conducted the campaigns of Thomas E. Dewey for governor of New York in 1942 and for president in 1944 and 1948, and served as Republican national chairman from 1944 to 1946. Serving as one of Gen. Dwight D. Eisenhower's closest political advisers in the 1952 presidential campaign, Brownell took office in Eisenhower's cabinet as U.S. attorney general on Jan. 21, 1953.

In November 1953 he became involved in the unresolved Harry Dexter White controversy with former President Harry Truman. During the Army-McCarthy hearings in 1954, he forbade the public release of Federal Bureau of Investigation data obtained by Senator McCarthy from an unnamed government employee. Later, when McCarthy called on employees to forward him information on subversion and corruption in government, Brownell held that such an appeal was "an open invitation to violate the laws" and that it lent itself to the substitution of government by an individual for government by law.

Brownell has energetically supported the administration's employee security program. In March 1955, however, the administration reacted to mounting criticism by revising its security procedures to insure accused employees "fair and impartial treatment." Critics, nevertheless, continued to demand that accused employees be granted the right to face their accusers, the denial of which they claimed was a violation of the 5th Amendment's "due process of law" clause. In reply, Brownell has maintained that the clause does not cover government employment and that the government needs publicly unidentified undercover agents and paid informers to protect the basic security of the country.

BRUCKER, Wilber Marion, American lawyer and public official: b. Saginaw, Mich., June 23, 1894. A former Republican governor of Michigan, he was appointed secretary of the army by President Dwight D. Eisenhower on June 22, 1955, following the resignation of Robert T. Stevens.

After receiving his LL.B. degree from the University of Michigan in 1916, Brucker participated in the border campaign of 1916 against Pancho Villa, and later in World War I as a first lieutenant in the 42d Division. On his return to the United States he was admitted to the Michigan bar in 1919 and began practicing law in his native Saginaw. Subsequently he served as assistant prosecuting attorney of Saginaw County (1923-27) and as assistant attorney general (1927) and attorney general of Michigan (1928-

30). In 1930 he was elected governor of Michigan on the Republican Party ticket, serving until 1932, when, in a bid for a second term he was defeated by the Democratic candidate, William A. Comstock. Returning to law practice after his defeat, he became a partner in a major Detroit law firm, Clark, Klein, Brucker, and Waples. He also became chairman of the Committee on Ethics of the American Bar Association.

Although Brucker never held another elective office, he was active as Republican Party chairman of the 14th Congressional District Committee since 1944. On April 6, 1954, he was named general counsel of the Defense Department (confirmed April 19), in which capacity he was serving at the time of his appointment as secretary of the army.

BUDGET, U.S. See TREASURY OF THE U.S.

BUILDING AND CONSTRUCTION. As 1955 drew to a close, it left behind another record for the volume of new construction put in place in the United States. It was estimated by the United States Departments of Commerce and Labor that the total expenditures would be about \$42 billion, 12% above the previous record of \$37.6 billion set in 1954.

The main impetus for 1955's higher level of activity was new housing construction, which increased 22% and accounted for nearly one half of the \$30 billion spent for all new private construction. The continuous process of suburbanization, going on since the close of World War II, plus new highway construction, have created a tremendous demand for stores, restaurants, and garages; this group alone showed an increase of more than 50% in activity over 1954. Industrial construction, responding to the pressure on production facilities evidenced by record industrial production levels, increased 18%. Of special interest also was the continued high level of building of religious structures, which in both 1954 and 1955 increased by 25% over the previous year.

In public construction the overall increase was small (2%). Only moderate gains, in the light of the tremendous backlog of needs, were recorded by schools (15%), sewer and water installations (10%), and highways (9%). Hospital building declined 10%. The \$800 million (or 50%) drop in industrial-type construction, reflecting completion of projects for the Atomic Energy Commission, more than offset the nearly 30% rise in other types of military facilities occasioned by stepped-up air force and continental defense activity. Expenditures for public housing (26% below 1954) and conservation work (15% below 1954) continued their three-year decline.

New Housing.—For the seventh year in a row the number of starts of new nonfarm residential units exceeded 1 million. The preliminary estimate for 1955 of 1,300,000 new units, less than 2% public-owned, exceeds every year except the record 1950 total of almost 1,400,000. For the first six months of 1955 the seasonally adjusted annual rate of new private houses started was only 1% below the same period in 1950. However, increased down-payment requirements for government-insured housing, coupled with tighter credit and monetary policies, kept new starts in the second half of 1955 well below the comparable 1950 period. Nevertheless, strong supporting factors remained, such as high and increasing real incomes, favorable financing, and a relatively high removal rate. Effective vacancy rates were

only slightly above 1950, indicating a sustained demand. (See also HOUSING.)

Building Permits.—As an important indicator of private residential and selected nonresidential building activity (in 7,000 reporting places which account for about 75% of the total non-farm population in the United States), building permit statistics throw important light on the geographic distribution of the building boom. The Northeast area, which population-wise has been relatively more static than other sectors, both in terms of growth and mobility, showed overall increases of about 13% over 1954 in the valuation of all building permits issued during the first 8 months of 1955. The West, with the largest population increases and movements, showed a corresponding 26% increase.

Costs.—After remaining relatively stable for several years, construction costs in 1955 moved upwards. The steady rise which began in February 1955 accelerated significantly in July and August as the basic steel price increase was passed on to fabricators, as copper and brass scarcity became acute, and as the railroad car shortage disorganized lumber distribution schedules. Preliminary indications were that average wholesale prices of construction material would be at least 6% higher than in 1954. According to press reports, shortages of cement, gypsum board, tile, and other materials in high-activity areas resulted in premium prices, allocations, and hoarding.

The year 1955 also witnessed another round of moderate wage increases. A highly competitive bidding situation, especially on highway and engineering projects, coupled with observable but unmeasured technological and productivity gains, countered the above forces. The combined effect was to push apparent overall costs to a level about 5% higher than in 1954.

Employment and Earnings.—Contract construction employment, which continued the gradual decline begun in 1953, fell to an average level of about 2.5 million in 1955. (Inadequate statistics preclude definitive interpretation of this decline in the face of apparent increased construction volume.) Average hourly earnings for all construction workers started at a higher level than the 1954 figure of \$2.54, and it seemed that the average for 1955 would be about 2% higher. Average weekly earnings were rising proportionately, and would be just a few dollars short of \$100 in 1955.

Branch, Building Materials and Construc-
tion Division, U.S. Department of Com-
merce.*

BULGANIN, Nikolai A(leksandrovich), premier of the Soviet Union: b. Nizhni Novgorod (now Gorki), Russia, June 11, 1895. A member of the Soviet Communist Party since 1917, he served the government and party in a variety of important administrative capacities before World War II. During the war he rose rapidly in the government hierarchy, becoming in 1944 assistant minister of defense, as well as a member of the State Defense Committee (USSR war cabinet). In 1947 he was named minister of defense and was made a full member of the Politburo (renamed the Presidium in 1952). After the death of Joseph Stalin in 1953, he retained his membership in the greatly reduced party Presidium, and was also appointed first vice premier of the USSR, a member of the Presidium of the Council

of Ministers, and was renamed defense minister.

With the sudden resignation of Premier Georgi Malenkov on Feb. 8, 1955, Marshal Bulganin was nominated for the premiership by Nikita S. Khrushchev, first secretary of the Communist Party, and was elected by the Supreme Soviet. In his inaugural address on the following day, he reflected the reversal of Soviet internal policy when he declared that the USSR "must develop heavy industry as the basis of all our economy."

During 1955, Premier Bulganin, as nominal leader of the Soviet Union, headed a delegation to Warsaw, Poland (May 11-14), where a mutual defense treaty modeled after the North Atlantic Treaty Organization was signed between the USSR and its seven eastern European satellites; accompanied Khrushchev to Yugoslavia (May 26-June 2), where discussions with Tito resulted in the resumption of friendly relations between the two countries; attended the Geneva Conference (q.v.); was host to a West German delegation headed by Konrad Adenauer in discussions (September 9-13) which resulted in the establishment of West German-Soviet diplomatic relations and an agreement to release German prisoners of war held in the USSR; and led the Soviet delegation in talks with East German leaders (Moscow, September 17-20) which resulted in an agreement that restored sovereignty to East Germany. On November 17, Bulganin, with Khrushchev and a 100-man party of Soviet officials, embarked from Moscow on a goodwill tour of India, Burma, and Afghanistan.

BULGARIA. A Soviet-controlled and Communist-dominated people's republic of southeastern Europe, Bulgaria is bounded on the north by Rumania, on the east by the Black Sea, on the south by Turkey and Greece, and on the west by Yugoslavia.

Area and Population.—Bulgaria has an area of 42,796 square miles. The population increased from 7,022,206 at the 1946 census to an estimated 7,500,000 in mid-1954. About 73% of the people live in rural areas. A majority (88%) speak Bulgarian as their mother tongue; Turkish speakers (9.8%) are the largest minority group. The principal cities, with their 1946 populations, are the capital, Sofia, 366,925 (est. 1950, 500,000); Plovdiv, 125,440; Stalin (formerly Varna), 77,792; Ruse, 53,420; Burgas, 43,684; and Pleven, 38,997.

Government.—The Bulgarian People's Republic was proclaimed on Sept. 15, 1946. According to the Constitution of 1947, the highest organ of the government is the unicameral National Assembly (Narodno Sobranie), consisting of 249 deputies. Although the constitution supposedly guarantees free elections, citizens cannot organize their own parties or place on the ballot candidates for the assembly who are unacceptable to the Communist Party. The assembly elects and, when not in session, is represented by the Presidium of the National Assembly, whose chairman is Georgi Damianov. The National Assembly also "appoints" the cabinet, which is presided over by Premier Vulko Chervenkov.

Political power is actually vested in the Politburo, an organ of the Central Committee of the Communist Party. The party is the dominant force in the Fatherland Front (Otechestven Front), which also includes splinter groups of traditional democratic parties that are willing to accept Communist control. There are approximately 455,000 members in the party, and 2,000,000 in the Fatherland Front.

Bulgaria is divided into 12 provinces, which in turn are subdivided into 95 districts, 108 towns, and 2,034 village communes. Provincial, district, and local councils are elected by popular vote, but only candidates of the Fatherland Front can appear on the ballot.

In its government organization, constitutional provisions, and political ideology, Bulgaria follows the example of the USSR.

Education.—The government is in complete control of the educational system. Elementary training is obligatory, and according to official reports illiteracy has been reduced to 5% of the population. At the beginning of 1955, Bulgaria had 20 institutions of higher education, with a combined enrollment of 32,000, almost half of whom received government scholarships. Many students live in government dormitories. The largest and most

important of the higher institutions are Sofia, Stalin, and Plovdiv universities.

In 1954 there were 8,635 elementary schools (including 1,116 for Turkish-speaking pupils), with 1,092,042 pupils and a staff of 44,027, and 216 secondary schools (including 7 for Turkish-speaking students). Bulgaria has 24 theaters, 5 opera companies, and 10 symphonic orchestras. The 1955 budget allocated 4,879 million leva* for educational and scientific purposes.

Religion.—Over 85% of the people belong to the Bulgarian Orthodox Church, which, under the Communist regime, has lost all vestiges of independence, and whose position has been further weakened by official antireligious campaigns. Moslems, totaling about 10% of the population, form the second largest religious group. Approximate percentages of other groups are as follows: Roman Catholic, 0.77; Armenian (Gregorian), 0.31; Protestant, 0.21; Jewish, 0.08.

Finance.—The 1955 budget provided for revenue of 18,195,400,000 leva and expenditures of 17,320,400,000. Turnover taxes and profits from socialist industry were to provide 77.8% of the revenue; 54.6% of expenditures was allocated to the national economy, and 11% to national defense. Public health, social security, and pensions were to receive 1,072,000,000 leva.

A government decree of April 22, 1955, reduced retail prices from 10 to 30% on several hundred items of consumer goods.

Defense.—Under the terms of the peace treaty of 1947, Bulgaria's armed forces are limited to 65,500 men, including 55,000 infantry, 5,200 air force troops, 1,800 antiaircraft troops, and 3,500 naval personnel. According to a New York Times report, Bulgarian forces were estimated in 1955 at 11 to 16 divisions totaling 165,000 to 195,000 men. The Western powers have repeatedly protested against Bulgarian violations of peace treaty restrictions. On Sept. 20, 1955, following the Soviet example, Bulgaria announced that she would cut her armed forces by 18,000 men by Dec. 31, 1955.

Agriculture.—According to the Second Five-Year Plan (1953-57), the government will allocate 3 billion leva for capital investments to develop cultivation and stockbreeding. The number of tractors is to be increased to 23,000 (mid-1954 est., 14,700) in terms of 15-hp units, and the number of combines to 5,000 (mid-1954 est., 1,800). If the plan is fulfilled, the total irrigated area will be increased from 675,000 acres in 1955 to 1,250,000 acres in 1957. The 1955 budget allocated 2,252 million leva for mechanization and other improvements. During the year 17 new machine and tractor stations were established, bringing the total to 166.

As of 1954, 51.7% of the arable land had been collectivized; this is a much larger percentage than that of any of the other Soviet satellites. Collectivization has been particularly intensive in the fertile regions north and south of the Balkan Mountains and in Southern Dobruja. There are some communes, but most of the collective farms are organized internally like Soviet kolkhozes. On Jan. 31, 1955, the Central Committee of the Communist Party ruled that the charters of collective farms be amended to permit differential remuneration for work, and so provide financial incentives for increased production. Following current Soviet practice, the same decree ordered that experienced managers and party workers be sent from the cities to assume leading positions in rural communities. Despite official claims of steady progress in agriculture, there are continued reports of peasant opposition to regimentation.

According to official reports, collective farms market 65% of the grain crop, and private farms, which hold 45.5% of the arable land, market 33.5%. Collective farms also play an increasingly important role in the production of industrial crops, raising most of the country's cotton, sugar beets, and roses.

State farms, whose internal organization follows closely that of the Soviet sovkhozes, occupy

* The Bulgarian lev is linked to the Soviet ruble, at the ratio of 1 ruble to 1.70 leva. Since the ruble equals 25 cents in U.S. currency at the official rate, there are 6.8 leva to the U.S. dollar.

2.5% of the arable land and market 1.5% of the country's total grain crop. On March 20, 1955, the government announced that it had decided to consolidate the 108 state farms into 49, allegedly for the purpose of increasing production by reducing administrative overhead.

The Second Five-Year Plan places particular emphasis on livestock breeding, but progress has been negligible. Livestock totals as of December 1953, with 1957 targets in parentheses, are as follows: cattle, 1,700,000 (2,100,000); hogs, 2,070,000 (2,200,000); sheep and goats, 8,400,000 (9,700,000).

In 1954, Bulgaria produced about 2,400,000 metric tons of bread grains and 1,600,000 metric tons of coarse grains. Sugar beet production amounted to 700,000 metric tons in 1952, and tobacco production, 49,799 metric tons in 1949.

Industrial Production.—The Second Five-Year Plan calls for an industrial investment twice as great as that of the First Five-Year Plan. By 1957 the production of machinery and industrial tools is expected to increase by 78%, and that of consumer goods by 48%. Special emphasis is placed on the construction of new power stations, the capacity of which is expected to exceed 430,000 kw. by 1957.

The 1955 annual plan of industrial construction called for an investment of 4 billion leva. The plan stipulated that the hydroelectric stations at Stara Zagora, Pasarel, and Kokalyane be completed during 1955. During the year the thermal power station at Dimitrovo (Pernik) and several diesel stations were expanded, and work was continued on the Stalin Dam, largest in the country, which, when completed, will irrigate 250,000 acres. It was also expected that coal mines with an annual output of 2,275,000 tons of coal would be opened during 1955.

The estimated production during 1954 of selected commodities was as follows: coal and lignite, 8,600,000 metric tons; cement, 793,000 metric tons; pig iron (1952), 10,640 metric tons; electricity, 1.8 billion kw.-hr.; woolen fabrics (1953), 9.8 million meters; and cotton fabrics, 125 million meters.

Foreign Trade.—No reliable statistics are available on Bulgaria's foreign trade. Reciprocal trade agreements were signed for the first time with Indonesia (December 1954), Israel (December 1954), Turkey (Feb. 23, 1955), and western Germany (April 29, 1955). A protocol regulating trade with the USSR during the year was signed on March 2, 1955. Under its terms the USSR was to continue to sell Bulgaria industrial equipment, machinery, and cotton in return for nonferrous metal ores, tobacco, and other agricultural products. During the course of 1955, trade and payments agreements were signed with all other European Communist countries, and on March 16, a trade agreement was signed with Yugoslavia. From September 5 to 20, an international fair was held at Plovdiv.

Bulgaria's trade with western Europe has increased, but that with the United States is negligible. On Aug. 16, 1955, the General Motors Corporation announced that it would not permit its automobiles to be sold to Bulgaria.

Transportation and Communications.—Bulgaria has 13,870 miles of roads (1949) and 2,670 miles of railways (1952). The Danube River is an important traffic artery. Ruse and Vidin are the chief river ports, and Stalin and Burgas are the principal Black Sea ports. On March 10, 1955, a Danube navigation agreement with Austria was

signed in Sofia. Bulgaria has about 61,000 telephones (1954) and 300,000 radios.

Principal Events, 1955.—The year 1955 saw in Bulgaria the same adjustments in domestic and foreign affairs that characterized the Soviet Union and its other satellites. Trade, cultural, and political relations with other Communist nations were further cemented. On February 17, Bulgaria signed a protocol on cultural relations with Communist China. The country participated in the Soviet-sponsored Warsaw Conference and ratified (May 28) the eight-nation eastern European mutual defense treaty. On June 3, the Soviet leaders Nikita S. Khrushchev, Nikolai A. Bulganin, and Anastas I. Mikoyan visited Sofia to explain the Soviet policy of coexistence with the capitalist world. On June 14, Moscow announced that Bulgaria would receive atomic research equipment and scientific and technical equipment.

In Bulgaria, as in other Communist countries, the policy of war with capitalism has been replaced by a policy of coexistence. In March 1955, Foreign Minister Mincho Neichev declared that Bulgaria would pursue a policy of peace and international cooperation. Relations with Yugoslavia have been normalized, although it was reported on September 12 that 50 Bulgarian Army officers had been arrested for urging a military alliance with that country. On March 1 the Presidium decreed the termination of hostilities with Germany. Although tension had subsided on the Turkish and Greek frontiers, relations with Bulgaria's southern neighbors were by no means satisfactory in 1955. On Dec. 15, 1954, negotiations with Greece concerning Bulgarian reparations reached an impasse, but on Aug. 16, 1955, an agreement was signed on the avoidance and settlement of border incidents between the two countries. In March 1955, Turkish soldiers were accused of having fired on Bulgarian frontier guards, and in April Bulgaria announced that she had granted asylum to two Turkish fliers.

A tragedy occurred on July 27, 1955, when Bulgarians shot down a commercial plane of El Al Israel Airlines, Ltd., north of Petrich. All 51 passengers and 7 crew members were killed. On July 29, the Bulgarian government expressed "deep regret" for the disaster, promised to punish those responsible, and offered to pay damages to the victims' relatives. A special note was transmitted on August 11 to the United States via the Swiss legation, in which Bulgaria apologized for the deaths of 12 Americans in the disaster.

On December 14, Bulgaria, along with 15 other countries, was elected to membership in the United Nations.

Associate Professor of History,
Stanford University.

BUREAU OF EMPLOYMENT SECURITY. The Bureau of Employment Security (BES) is organizationally in the U.S. Department of Labor, and is the federal partner in the federal-state employment security system. There are two major entities in the bureau—the U.S. Employment Service (USES) and the Unemployment Insurance Service (UIS). Through the USES, the bureau promotes and develops a nationwide system of state-administered public employment offices, and operates an employment service for the District of Columbia and United States territories. Through the UIS, the bureau assists the states in carrying out their responsibilities under their own unemployment insurance laws. The two services

complement each other in carrying out federal responsibility for an employment security system authorized by the Wagner-Peyser Act (1933), the Social Security Act (1935), and supplementary legislation.

United States Employment Service.—The USES includes a Veterans Employment Service and a Farm Placement Service, and provides specialized assistance to state agencies in matters related to the occupational adjustment of workers and the solution of employer manpower problems. This federal-state system is also charged with meeting defense manpower needs during national emergency or partial mobilization. Some 1,700 local employment offices are operated by the states.

Activities of the public employment offices in the fiscal year 1955 reflected the economic changes occurring during the year. As economic conditions improved and unemployment declined from the high levels of the previous year, new applications for work declined about 4% to 8.5 million. Public employment offices made 14.5 million job placements—2% fewer than in the fiscal year 1954. The decline occurred among placements in agricultural jobs, which dropped 3% to about 9 million. Placements in nonfarm jobs remained unchanged at 5.5 million.

Employment counselors in local offices held 1.4 million job-counseling interviews with approximately 850,000 applicants who required assistance in making a vocational choice or adjustment—about 22% greater than the preceding year, and the highest number since comparable data became available in July 1948.

Services to Special Groups.—The bureau developed a *Handbook on Counseling and Employment Services to Special Groups* and issued the first six of a series of guides to be used in evaluating the job capacities of individuals with specific disabilities. To facilitate services to other special groups, Supplement 1 to the *Dictionary of Occupational Titles*, which describes and classifies occupations, was published.

During the fiscal year 1955, 339,400 handicapped persons filed new applications for work—7% more than the number filing in the preceding fiscal year. Approximately 46% of these applicants were given job counseling assistance, and local offices made some 214,200 selective placements of disabled workers to nonfarm jobs. In addition to strengthening job development services for the severely handicapped, studies are being sponsored by the bureau to obtain more detailed information on job opportunities for older workers.

Services to Veterans.—To assure that newly released Korean veterans were fully acquainted with available services, state employment security agencies provided appropriate informational services to some 260 separation installations. At about 80 of these, employment service personnel provided direct services to releasees.

Veteran applications for employment in the fiscal year 1955 totaled 2,089,000—slightly below the number in the previous year. Job counseling interviews with veterans rose to 390,600—more than 20% of the number in 1954. Reflecting the improved economic conditions during the year, nonfarm placements of veterans rose about 6% to 1,381,900.

A total of 125,500 disabled veterans filed new work applications during the year, and 57,700 received job-counseling assistance. In carrying out the policy of extending “preferential treatment” to disabled veterans, public employment

offices made 99,100 placements of such veterans in nonfarm jobs.

Labor Market Conditions.—Starting from relatively low levels of activity in 1954, there was steady improvement in the economy in the fiscal year 1955. Definite indications of the upward trend in the overall economic picture began to appear in October 1954. By mid-1955 a substantial expansion had occurred in economic activities, with many new records established.

Total employment during the fall and winter months of 1954 held firm, except for seasonal fluctuations, but in April 1955 a sharp expansion of employment became evident. In April 1955, the number of employed persons (61.7 million) exceeded the April 1954 number by 1 million, and surpassed by 100,000 the previous all-time high in April 1953. The entire change during this period occurred in nonagricultural employment, which rose to 55.5 million in April 1955, about 1 million above the level for the previous April. The total number of unemployed declined from a peak of 3.7 million in March 1954 to 3 million by April 1955. Similarly, insured unemployment among workers covered by the state unemployment insurance laws dropped from a weekly average of 2,180,000 in April 1954 to 1,471,000 in April 1955.

By the end of fiscal year 1955, the number employed rose to a new all-time high of 65 million. Nonagricultural employment was also at a record level of 57.3 million. Reflecting the employment gains, the total number of jobless persons declined to 2.5 million by July, and insured unemployment dropped to a weekly average of 1,092,000.

During 1955, manpower developments in most of the major labor market areas reflected the widespread and substantial recovery from the economic downturn of the previous year. In July 1954 a total of 53 major production and employment centers—representing a peak figure for the post-Korean War period—were classified by the BES as “areas of substantial labor surplus.” The number of surplus areas dwindled during the first half of fiscal year 1955, as employment totals edged upward, and stood at 44 in the middle of the fiscal year. By the end of the fiscal year, only 31 major centers remained on the substantial surplus list.

As a result of the upward surge in the demand for workers and the consequent tightening of local labor availability, occupational shortages became more numerous during 1955, especially in professional workers, such as electrical and mechanical engineers, and in clerical and sales personnel, such as stenographers and typists. (See also LABOR; LABOR FORCE.)

Community Employment Planning.—Local community activities to stimulate the development of new job opportunities were intensified during fiscal year 1955. The bureau worked closely with state and local offices and employer, labor, and civic groups, and participated in the work of the river basin commissions.

Labor Market Information and Analysis.—Information regarding available job opportunities and the employment and unemployment situation in specific geographic areas, industries, and occupations was made available by the BES to other government agencies, community groups, employers, labor organizations, and the general public.

The bureau released bimonthly analyses covering employment and unemployment conditions in 149 major production and employment centers.

These areas account for about 70% of nonagricultural wage and salaried employment. Surveys of the employment situation in about seven key industries were prepared during the fiscal year, while analyses of occupational shortages, as reflected by the interarea recruitment activities of the employment service, were published each month. A supplement was prepared to the *Job Guide for Young Workers*, which provides information on important entry occupations, and procedures were developed to obtain data on the economic and social characteristics of the insured unemployed on a regular and current basis.

Farm Placement Program.—In order to meet the needs for farm workers in the fiscal year 1955, it was necessary to supplement domestic farm workers with workers recruited from Puerto Rico, Mexico, the British West Indies, and Canada for short periods of temporary work at peak seasons. About 342,000 foreign as well as 15,000 Puerto Rican workers were contracted for farm jobs. During the peak harvest months approximately 195,000 Mexican workers, 10,000 British West Indians, and 6,000 Canadian workers were reported at work in 33 states.

Unemployment Insurance Service.—The UIS carries federal responsibilities for the administration of the federal-state system of unemployment insurance, established by the Social Security Act of 1935. There are 51 employment security agencies in the states, the District of Columbia, and the territories of Alaska and Hawaii, operating under their employment security laws. The purpose of the program is to compensate members of the covered labor force for part of their wage loss when they are unemployed because of lack of work.

The payment of benefits for individual workers' unemployment is made from payroll taxes on employers under the state employment security laws. The Federal Unemployment Tax Act (originally Title IX of the Social Security Act) stimulated the enactment of these state laws by establishing a federal payroll tax of 3% on employers of 8 or more workers in commerce and industry (4 or more workers after Jan. 1, 1956), and by allowing a credit of up to 2.7% against the federal tax for taxes paid to a state under an approved state law. Other parts of the Social Security Act assure high standards for the administration of the program by providing for payment by the federal government of all costs of administration and establishing the conditions which a state unemployment insurance law must meet to entitle the state to federal funds. The statutory responsibility of the Department of Labor for the approval of state laws, and the certification of states for administrative grants are carried by the UIS.

In all states, benefits vary in relation to prior wages. As of October 1955, maximum weekly benefits for resident claimants varied under the laws from \$24 in one state to \$36 in two states and \$45 in Alaska, with 31 states paying \$30 or more. In 10 states the maximum is increased by an allowance for specified types of dependents. The maximum duration of benefits varied from 16 to 30 weeks, with 27 states having a duration of 26 weeks or more, and with one state having a duration of 30 weeks.

Beginning Jan. 1, 1955, federal civilian workers were included in the unemployment compensation program. Unemployed federal workers are paid benefits in the same amounts and under the same conditions as workers in private employment under the applicable unemployment in-

surance law, usually that of the state in which they had their last official status in federal service. During the first six months of the program, nearly 100,000 initial claims were filed by former federal employees, and \$16,000,000 was paid in benefits to nearly 60,000 of these claimants.

During the fiscal year 1955, 5,405,000 claimants drew benefits under the state unemployment compensation program and the unemployment compensation program for federal employees for 73,517,000 weeks of unemployment. Benefit payments averaged \$25.05 per week for an average of approximately 14 weeks. A total of \$1,142,000,000 was collected under the state laws, and \$187,000,000 was paid to the states as interest on the unemployment trust fund. A total of \$1,776,000,000 was paid in benefits under the state laws, and funds available for state benefits at the end of the year were \$8,011,000,000.

Unemployment Benefits for Veterans.—Special federal benefits are payable, under the Veterans' Readjustment Assistance Act of 1952, to veterans with service on or after June 27, 1950. These benefits are paid by the state employment security agencies, as agents of the federal government, under agreements with the secretary of labor; and in Puerto Rico and the Virgin Islands they are paid through their respective employment services. To be eligible for these benefits, veterans must meet all requirements of the law of the state making payment, excepting the qualifying employment and wage requirement. The federal benefits are \$26 a week for 26 weeks. Veterans eligible under a state law must exhaust those benefits first, but if their state benefits are less than \$26 a week, they are entitled to a federal supplement to bring payment to \$26 a week.

From the beginning of the program in October 1952 to the end of the fiscal year 1955, almost 900,000 veterans filed claims for benefits, \$205,985,000 being paid for 8,850,000 weeks of unemployment. During the fiscal year 1955, 369,000 veterans filed new claims, \$106,900,000 in benefits being paid for 4,600,000 weeks of unemployment. (See also VETERANS ADMINISTRATION.)

BURKE, Arleigh Albert, United States naval officer: b. near Boulder, Colo., Oct. 19, 1901. On May 25, 1955, he was nominated by President Eisenhower to succeed Admiral Robert B. Carney as chief of naval operations (effective Aug. 16, 1955). Burke was in command of the destroyer forces of the Atlantic Fleet at the time of his appointment.

Graduated from the U.S. Naval Academy in 1923, he was commissioned an ensign and assigned to the battleship *Arizona*. In 1932 he took an M.S. degree in chemical engineering at the University of Michigan. During World War II, he was commander of Destroyer Squadron 23 (the "Little Beavers") which fought 22 actions in the Pacific theater from Nov. 1, 1943, to Feb. 23, 1944. His command was credited with destroying a Japanese cruiser, nine destroyers, a submarine, seven other vessels, and 30 aircraft. He won the nickname of "31-Knot Burke" for his swift and successful action of Nov. 24, 1943, against Japanese transports evacuating troops

from Buka Island in the Solomon group. In 1944 he was named chief of staff to Vice Admiral Marc Mitscher, commander of the famous Task Force 58. A brilliant tactician, he planned the devastating carrier-based assaults on Iwo Jima, Okinawa, and Tokyo. He was aboard the flagship *Bunker Hill* when it was badly damaged by Japanese suicide planes off Okinawa in May 1945.

Immediately after the war, Burke was assigned as a temporary commodore to the General Board, which at the time was the highest policy-study office of the Navy. Later, in his capacity as assistant chief of naval operations for the Organizational Research and Policy Division, he became director of Operation 23, which in 1949 spearheaded the navy's unsuccessful fight against the administration's efforts to unify the armed forces and to give priority to the U.S. Air Force's B-26 strategic-bomber program. Despite this role in the "Admirals Rebellion," he was promoted to rear admiral in June 1950 and, with the outbreak of hostilities in Korea, was named commander of Cruiser Division 5 in Korean waters. He served in this capacity until 1951, when he was assigned to the military armistice commission at Panmunjom.

Prior to his nomination as chief of naval operations, Burke was outranked by 92 officers. The appointment, however, was in keeping with President Eisenhower's policy of placing younger, more vigorous men in the top commanding posts of the armed forces. On taking the new command, Burke was promoted to the rank of full admiral.

BURMA, Union of. Bounded on the west by India, East Pakistan, and the Bay of Bengal; by Tibet and China on the north; and on the east by Indochina and Thailand, this independent southeast Asian republic came into existence Jan. 4, 1948, when a treaty enacted by the British Parliament recognized Burma's independence. The union comprises Burma proper (area, including the Chin Special Division, 162,290 square miles); Shan State (61,090 square miles);

Kachin State (33,903 square miles); Kayah State (formerly Karenni States, 4,506 square miles), and Karen State (1,800 square miles), formally constituted June 1, 1954, after the final suppression of Communist and guerrilla activities in East Burma. The aggregate area is 261,789 square miles (exclusive of Great and Little Coco Islands, lying some 270 miles southwest of Rangoon and north of the Andamans, sovereignty of which passed to Burma under the 1948 treaty).

Population.—The population was provisionally estimated at 19,045,000 in 1955 (1953 census, 18,859,000). Besides indigenous Tibeto-Burman races, there are large elements of Chinese, Indo-Burmans, and Indians. The capital is Rangoon (pop., 1953, 613,000); other principal cities include Mandalay (173,263), Moulmein (89,767), and Bassein (83,569). Buddhism is professed by 843 of every 1,000 Burmese.

Government.—Under a constitution approved by a constituent assembly elected in 1947, Parliament consists of two elected legislatures: a 125-member Chamber of Nationalities, including 53 members representing the central government; and a Chamber of Deputies, composed of 250 members elected on the basis of proportional representation. The government is headed by a president (Dr. Ba U, elected March 12, 1952, by both houses of Parliament for a 5-year term), assisted by a 21-member cabinet. The prime minister is U Nu (appointed March 12, 1952). In 1955 Sao Hkun Hkio was minister of Shan State and chairman of the Burmese delegation to the United Nations. Joseph Satterthwaite took up his duties as United States ambassador at Rangoon on May 10, 1955.

Finance.—Burma's unit of currency is the kyat (K4.7619 = U.S.\$1). Revised budget estimates (in millions) for 1954-55 showed receipts of K1,044 (customs taxes, K239; other taxes, including sales and income taxes, K373; rehabilitation contributions, K306; other non-tax receipts, K106; and reparations, K20); expenditures, K1,307 (current, K753; capital, K554). The proposed budget for 1955-56 projected (in millions) total receipts of K895 (revenue, K738; capital, K159); expenditures, K950 (current, K760; capital, K190), forecasting a deficit of K55. Capital outlays for selected government expenditures amounted in 1954-55 to K770.8 million, comprising (in millions) agriculture, K44.0; irrigation, K5.2; forests, K11.2; mining, K12.0; transportation and communications, K223.2; power, K168.1; industry, K133.1; and construction, K130.6.

Education.—The government's expansion program calls for the yearly addition of 2,000 primary schools and the training of 6,000 additional primary school teachers. In March 1955 more than 1,242,000 students were attending state schools—an increase over 1954 of about 42%. There were 220 high schools (42,600 students), 405 middle schools (103,600 students), and 8,951 primary schools (1,096,000 students) in 1954. Teachers in these categories in 1955 numbered, respectively, 1,076, 3,584, and 23,337. Additional registered private schools numbered 53 in June 1954 (aggregate enrollment, 82,586 pupils). Four colleges, 3 intermediate colleges, and a branch medical college were opened in 1954-55 at the University of Rangoon.

Economy.—On the basis of 1947-48 prices, the gross domestic product (goods and services) was estimated at K4,836 million in 1954-55, an increase of about 6% over 1953-54. National gross income totaled K5,166 million, compared with K4,698 million in 1953-54.

Production.—Agriculture employs two out of every three workers, and accounts for 40% of the national income. The index of total agricultural production rose in 1954-55 to 85% of pre-war volume. Acreages and yields in principal categories were as follows: paddy, 10,161,000 acres, 5,712,000 tons; groundnuts, 779,000 acres, 154,000 tons; sesamum, 1,402,000 acres, 36,000 tons; cotton, 270,000 acres, 23,000 tons; pulses, 1,180,000 acres, 206,000 tons; sugarcane, 90,000 acres, 1,150,000 tons; and millet and wheat, 600,000 acres, 83,000 tons. Jute acreage aggregating 21,700 acres produced 6,000 tons of fiber and 5,000 baskets of seed. There was an estimated sown tobacco acreage of 113,000 yielding 350 tons of cigarette tobacco.

Production of major timbers rose from 630,000 tons in 1953-54 to 662,000 tons in 1954-55,

Premiers Nu of Burma (center), Nasser of Egypt (l.), and Nehru of India (r.) celebrate Burma's New Year in April.

INTERNATIONAL NEWS PHOTOS

but production of teak was still far below the prewar level. A program developed with the assistance of the U.N. Food and Agriculture Organization was seeking to increase the rate of teak extraction (about 150,000 cubic feet in 1954) to 450,000 by 1960, using mechanical equipment to supplement the traditional trained elephants, whose number had declined from 6,500 in 1941 to 1,200 in 1954.

The output of crude petroleum (44 million gallons in 1953-54) reached 25.21 million gallons in the first half of 1954-55, and was expected to exceed 50 million gallons by the end of the production year. Other mineral production for the first half of 1954-55 included lead, 12,200 tons; zinc, 5,900 tons; tin, 300 tons; and tungsten, 200 tons.

External Trade.—During the first half of 1954-55 the total value of exports increased to K597 million, compared with K485 million in the same period of 1953-54; imports totaled K503 million (consumer goods, K370 million; capital goods, K133 million), compared with K442 million in the corresponding period of 1953-54. Under a 3-year trade agreement signed July 1, 1955, with the Soviet Union, Burma is to ship 150,000 to 200,000 tons of rice and other goods to the USSR each year in return for industrial and technical equipment. Rice exports in the first half of 1954-55 amounted to 840,000 tons, valued at K454 million; other principal exports were: cotton, 12,000 tons (K39 million); pulses, 54,000 tons (K26 million); rubber, 8,000 tons (K19 million); oil cakes, 34,000 tons (K15 million); metal and ores, 27,000 tons (K18 million); and timber, 17,000 tons (K12 million).

Communications.—In the course of the K290 million restoration program made necessary by World War II damage to Burma's railways, repairs were completed at the Ava Bridge across the Irrawaddy River near Mandalay, and traffic was resumed in 1955. Of the 2,059 miles of railway operating in 1953, 97 miles were relaid in 1954, and 73 miles of track were rehabilitated in areas recovered from antigovernment insurgents. Burma Railways in 1954-55 carried 21.5 million passengers and 344 million ton-miles of freight; Union of Burma Airways flew 27 million passenger miles and carried 1 million ton-miles of freight; and Burma Inland Waterways carried 3.9 million passengers and 184 million ton-miles of freight. Work in progress in 1955 involved the rehabilitation of the entire 3,125 miles of the railway system; improvement of 6,770 miles of district roads; and construction of 3,500 miles of farm-to-market roads. Burma has 60 miles of canals, more than 4,000 miles of navigable waterways, and 12,500 miles of motor highways. The first radio telephone link between Burma and India was inaugurated on March 24, 1955.

Principal Events, 1955.—The year 1955 was notable for the activity of Prime Minister Nu on visits to various countries. After making a state visit to Thailand (March 7-14), he began an international tour on May 28, during which he visited Israel, Yugoslavia, the United Kingdom, the United States, and Japan. His three-week stay in the United States included a meeting with President Dwight D. Eisenhower on June 29. He spent some time in India en route to the Soviet Union in late October for an official two-week visit. On December 1-7, Soviet Premier Bulganin and Communist Party Secretary Khrushchev visited Burma, where they signed an agreement giving Burma economic aid in exchange for rice.

Marshal Tito, president of Yugoslavia, made an 11-day official visit to Burma beginning Jan. 6, 1955. Subsequently a protocol of economic cooperation was signed at Brioni, Yugoslavia (June 14), under which Yugoslavia undertook to purchase 50,000 tons of Burmese rice annually for five years. A similar agreement was concluded on July 18 with Indonesia.

John Foster Dulles, U.S. secretary of state, conferred with U Nu at Rangoon on Feb. 26, 1955, on questions affecting Asia and the Pacific area.

A new town, Bahtoomyo, was inaugurated Feb. 14, 1955, as the site of Burma's first Defense Services Academy in southern Shan State. The prime minister visited and formally opened the new settlements in the Coco Islands, on March 17.

DONOVAN ROWSE,
Author and Publicist.

BUSINESS AND DEFENSE SERVICES ADMINISTRATION. After lengthy consultations with industry and government officials, the Business and Defense Services Administration was established on Oct. 1, 1953. It was largely a merger of the old National Production Authority and the Office of Industry and Commerce, intended primarily to improve relationships between business and government.

Twenty-five industry divisions were set up to serve as a principal point of contact within government for business. Between them they represent the approximately 450 basic manufacturing industries in the United States. They are staffed with career experts in their various lines, and a majority of the divisions are headed by key executives from industry on loan from their companies for six months. Known as WOC's, because they are serving without compensation from the government, these division directors bring to BDSA a fresh viewpoint from specific industries and help the Department of Commerce in formulating policy. Through industry conferences and other special meetings, BDSA gets an even broader viewpoint from cross sections of specific industries, and at the same time provides a sounding board for industry to get its particular problems aired before the branches of government concerned.

Due to world conditions, BDSA is forced to devote the major part of its time and energy to defense and mobilization problems, under authority of the Defense Production Act. Defense production covers not only the assurance of proper supplies and materials for the production of military and atomic energy programs, but also the development of flexible measures to meet any future emergency. To meet these requirements the Defense Materials System (DMS) was put into effect April 1, 1954, to replace the cumbersome Controlled Materials Plan (CMP), which had taken almost as long to get into operation in the Korean War as it had in World War II. The DMS guarantees that the requirements of the military and atomic energy programs will be met by setting aside percentages of strategic materials to meet those requirements.

BDSA's mobilization responsibilities include the development of estimates on defense supporting and essential civilian requirements and the facilities needed to supply these requirements under stepped-up or all-out mobilization; making recommendations on tax amortization, stockpiling, evaluating the strategic importance of indi-

vidual plants, and stimulating pre- and post-attack measures for their protection.

With America's great industrial plants now vulnerable to devastating attack, proper planning by industry to assure the continuity of production and management is vital to the nation's survival. This is a job only industry can do, but BDSA, in meetings with individual companies, points out

what needs to be done and how some companies are solving the problem.

CADMIUM. The world supply of cadmium is obtained as a byproduct from the treatment of other metals, chiefly lead and zinc. Domestic production declined from 9,767,197 pounds in 1953 to 9,551,710 pounds in 1954. Consumption declined from the all-time high of 9,570,000 pounds in 1953 to 7,499,000 pounds in 1954. The most significant development in 1954 was the reversal of the import-export position. Imports in 1954 totaled 402,000 pounds, compared with 1,555,000 pounds in 1953; while exports were 999,000 pounds in 1954, compared with only 66,000 pounds in 1953. During the first half of 1955, production was 5,092,026 pounds; imports increased remarkably to 802,320 pounds; and exports were 589,875 pounds. (See MINERAL PRODUCTION for output of major countries.)

CALIFORNIA. Western coastal state, United States; admitted to the Union, Sept. 9, 1850. The "Golden State" ranks 2d in both area and population (1955) among the 48 states.

Area and Population.—Area: 158,693 square miles (land, 156,740; inland water, 1,953), divided into 58 counties. Population: (1950) 10,586,223; (est., July 1, 1955) 12,696,000. Urban places with populations (1950 census figure, unless otherwise indicated) over 15,000 are as follows:

¹ Special census, 1954; ² Special census, 1953; ³ Special census, 1955; ⁴ Special census, 1952.

Executive.—Chief state officers in 1955:

Governor: Goodwin J. Knight (Republican)
Lieutenant Governor: Harold J. Powers
Secretary of State: Frank M. Jordan
Treasurer: Charles G. Johnson
Attorney General: Edmund G. Brown
Supt. of Public Instruction: Roy E. Simpson

Constitution and Judiciary.—The present constitution went into effect in 1879. The Supreme Court comprises seven justices; chief justice in 1955 was Phil. S. Gibson.

Legislature.—The legislature (Senate, 40 members; Assembly, 80) meets in general session for 120 days in odd-numbered years, commencing the first Monday after the first day in January; and for a 30-day budget session in even-numbered years, starting on the first Monday in March.

The 1955 regular session of the California Legislature extended from January 3 to June 8. Enactments included creation of a Bay Area air pollution control district, authorization of an air sanitation program by the Department of Public Health, and appropriation of \$140,000 to the University of California for air pollution research. Provision was made for a \$200 million bond issue to finance the state building program. Increases were authorized in unemployment insurance benefits, aid to the needy blind and aged, and workmen's compensation benefits; and eligibility limits were extended under the Veterans Farm and Home Purchase Act. Other laws increased excise taxes on distilled spirits; revised the State Teachers' Retirement System; authorized the Toll Bridge Authority to finance new bridges; increased the state's share of county highway construction; and approved state employees' participation in social security at their own option. The act of 1920 forbidding alien ownership of property was repealed (subject to voters' approval in 1956); laws concerning abandoned iceboxes were tightened; and parents were made responsible for vandalism of minors. A \$500,000 flood control plan on the American River was authorized; up to 2,560 state scholarships were established; and a Legislative Audit Bureau was formed.

Finances.—State treasury receipts (1954-55 fiscal year): \$3,223,766,561.10; expenditures, \$3,196,260,155.68; treasury balance, \$287,453,935.79; long-term indebtedness, \$780,194,000.

Taxation.—State tax revenue (1953-54 fiscal year): \$1,216,917,087, including \$791,263,472 from a 3% general sales tax and selective sales and gross receipts taxes; \$101,143,700 from licensing; \$125,025,800 from corporate income taxes; \$96,168,833 from individual income taxes; \$79,203,428 from property taxes; and \$24,111,854 from gift and inheritance taxes. The state has no poll tax.

Banking.—As of June 30, 1955, the state's 66 national banks had \$14,679,300,000 in assets, \$7,458,898,000 in demand deposits, and \$5,997,891,000 in time deposits; the state's 107 other banks had \$5,498,520,000 in assets, \$2,203,822,000 in demand deposits, and \$1,981,304,000 in time deposits.

Education.—School attendance is compulsory for all between the ages of 8 and 16, inclusive.

Operating expenditures of \$674,596,951 (\$306.16 per pupil) for public elementary and secondary education in the 1953-54 fiscal year comprised (including reserves) \$379,713,415 from local school districts, \$359,504,414 from the state, and \$17,383,698 from the federal government. Expenditures for construction and improvements totaled \$275,118,343. Teachers' salaries (1954-55) averaged \$4,707 (elementary school teachers, \$4,477; high school teachers, \$5,137).

CALIFORNIA SCHOOL STATISTICS (As of March 31, 1955)

Type of school	No.	Teachers	Students
Public elementary (k-8).....	1,685 ¹	51,608	1,785,353 ²
Public secondary (9-12).....	322 ¹	26,998	469,449 ³

State colleges.....	10	1,675	32,017 ⁶
Colleges and universities.....	61		70,410 ⁷

¹ Number of districts. ² Excluding 25,165 special students. ³ Excluding 287,376 special students. ⁴ September 1954. ⁵ Excluding 112,642 special students. ⁶ Excluding 13,189 limited students. ⁷ Excluding 18,868 part-time students.

Social Welfare.—Public assistance expenditures from federal, state, and local funds in the 1954-55 fiscal year (excluding institutional costs) totaled \$340,237,879, including \$220,262,565 for old-age assistance, \$89,441,051 for dependent children, and \$12,223,017 for the needy blind; a monthly average of 492,409 persons received public assistance, including 59,772 persons who received \$17,867,210 in county-financed general home relief. Expenditures for correctional and penal institutions totaled \$24,065,317, including \$4,808,291 for construction and improvements. The state budgeted \$9,257,885 for the operation of youth correctional institutions in the 1955-56 fiscal year, exclusive of \$2,141,810 for construction and improvements.

CALIFORNIA WELFARE INSTITUTIONS

Type of institution	No.	Pop.

¹ Includes two hospitals with both mentally ill and mentally deficient patients. ² As of Aug. 31, 1955. ³ Estimated for the 1955-56 fiscal year. ⁴ As of June 30, 1955. ⁵ As of July 1, 1955.

Labor Force.—The labor force in July 1955 numbered 5,336,000, including 517,000 agricultural workers. Nonagricultural employment of wage and salary workers in July 1955 was 4,026,500, and for the 12 months ending July 1955 averaged 3,920,800. There were 172,000 unemployed workers in July 1955, and in the year ending June 1955, \$178,573,020 was paid in all types of unemployment compensation.

Manufacturing.—Establishments numbering 25,068 in 1953 had 1,058,374 employees who received \$4,779,275,000 in salaries and wages. A total of \$419,782,139 was spent for new plant and equipment in 1954. Value added by manufacture amounted to \$8,153,142,000 in 1953. Earnings of production workers in manufacturing

averaged \$81.05 for an average work week of 39.9 hours in 1954, and \$85.30 for 40.5 hours in the first six months of 1955.

MAJOR CALIFORNIA MANUFACTURES, 1953

Product or industry	No. of employees ¹	Salaries and wages (thousands of dollars)	Value added by mfr ²
Transportation equipment.....	278,316	\$1,362,009	\$1,964,976

Furniture and fixtures.....	21,376	89,216	150,385

¹ Average per year. ² Value of products less cost of materials, supplies, fuel, electric energy, and contract work.

Mining.—The total estimated value of production in 1954 was \$1,371,941,000, representing a moderate decline from 1953, chiefly in the output of mineral fuels. Minerals of construction; salines; metals; abrasives; and ceramic, fertilizer, and chemical materials were produced at nearly the same level in 1954 as in 1953.

California normally ranks first among the states in production of borates, chromite, diatomite, iodine, mercury, sand and gravel, and tungsten. It stood second in its 1953 output, with 9.69% of the United States total.

CALIFORNIA MINERAL PRODUCTION, 1954¹ (In short tons, except as noted)

Other nonmetallic minerals ⁶		20,430,000

¹ Estimated. ² Included in "other metals." ³ Includes boron minerals, gypsum, and salt. ⁴ Includes sand and gravel. ⁵ Includes magnesium compounds. ⁶ Includes clay, lime, and talc.

Fisheries.—The commercial fish and shellfish catch in 1954 was valued at \$83,251,512, for 713,406,246 pounds. Poundages and values of major species were: skipjack, 169,463,946 (\$25,680,987); yellowfin tuna, 149,103,693 (\$25,559,675); albacore, 64,573,673 (\$13,142,936); sardine, 136,509,767 (\$3,701,222); bluefin tuna, 21,663,106 (\$3,655,684); sole, 19,732,179 (\$1,144,770); anchovy, 42,410,214 (\$850,527); and Pacific mackerel, 25,392,604 (\$808,592). Some 11,647 persons were engaged in commercial fisheries in the 1954-55 license year.

Agriculture.—Cash farm income in the first half of 1955 totaled \$1,022,254,000, and for the full year 1954 comprised \$905,299,000 from livestock and livestock products, \$1,599,297,000 from crops, and \$14,802,000 from government payments.

Receipts from principal livestock categories in 1954 included: dairy products, \$301,204,000; cattle, \$274,156,000; eggs, \$141,584,000; turkeys, \$49,669,000; and broilers, \$41,934,000. Major crops and receipts: cotton lint, \$251,215,000; grapes, \$107,080,000; oranges, \$90,824,000; lettuce, \$78,503,000; barley, \$72,301,000; hay, \$68,001,000; tomatoes, \$63,216,000; potatoes, \$56,777,000; rice, \$50,225,000; sugar beets, \$46,784,000; peaches, \$45,931,000; lemons, \$44,630,000. Greenhouse and nursery products yielded \$60,742,000.

The state's 123,074 farms (37,800,380 acres; harvested cropland, 8,334,031) had an average of 307.1 acres and \$59,144 in value of land and buildings per farm in 1954. There were 94,996 farms with telephones and 118,656 with electricity. Livestock on farms (Jan. 1, 1955) included 3,583,000 cattle, 461,000 hogs, 2,081,000 sheep, and 29,100,000 chickens (not including commercial broilers). During the 12 months ending June 30, 1955, 467,000 persons were engaged in agriculture.

CALIFORNIA CROP STATISTICS

* Average 1949-53. (Source: U.S. Dept. of Agriculture.)

Tourism.—California's tourist industry is supported by an estimated annual influx of over 4 million visitors who spend more than \$700 million in the state. (Actual figures for 1953: 4,300,000 tourists who spent \$772,000,000.) One of the new attractions for visitors in 1955 was the 350-room Beverly Hilton hotel opened in August in Beverly Hills.

Transportation and Communications.—All expenditures in the state for roads and highways and city streets in the 1953-54 fiscal year totaled \$391,972,000, and newly completed construction by the state amounted to 1,324 miles. In August 1955, the Toll Bridge Authority announced plans to build two bridges over the Strait of Carquinez.

Highways and roads on June 30, 1954, totaled 125,055 miles (68,042 surfaced, excluding 19,211 miles of city streets). Registered *motor vehicles* numbered 6,194,642 on Dec. 31, 1954, including 4,971,105 passenger cars. There were (1954) 34 *railroads* operating 8,540.5 line miles, and, in 1954, 10 regularly scheduled *airlines* and 465 *airports and airfields* (205 public and 260 limited).

Communications media included (1955) 149 AM and 37 FM *radio stations* and 26 operating *television outlets*; 133 daily *newspapers* (circulation, 4,087,431) and 636 other newspapers; and (Jan. 1, 1955) 1,609,071 for a total of 4,979,803.

Principal Events, 1955.—Within California in 1955, demands were probably never greater for state aid in solving problems created by the state's continued phenomenal growth. Among these was the increase of air pollution in the San Francisco Bay area as well as in the already hyper-irritated Los Angeles region, where the usual clamor went up not only for greater state attention to smog but to civilian defense in that vulnerable aircraft center. Statewide demands were also voiced for stricter control of liquor licenses and for increased water development.

There was much discussion in 1955 of the long-contemplated Feather River Project (see DAMS), comprising a series of dams and canals to bring badly needed water to the southern part of the state. During the year the Trinity River Project (a \$225 million program to create a 2.5 million acre-feet reservoir) was begun.

With the Eel, Russian, Klamath, and Yuba rivers, the Feather was one of several northern California streams that overflowed their banks beginning on December 22, flooding wide areas in a major disaster. Damage was estimated at \$150 million, and 65 lives were lost. Yuba City, which was flooded twice, was among the worst hit of scores of cities and towns affected.

California kept building and growing in a variety of areas. The state highway budget included planned construction of 300 miles of highways and 45 bridges. During 1955 the state legislature passed 2,103 bills, of which the governor approved 1,966 (see above, *Legislature*). All-time employment records were established in construction, finance, and service industries. Manufacturing employment was higher than at any time since 1943—the peak year of World War II. The civilian labor force reached a total of 5,475,000 persons in September. One of the few segments of the economy which suffered serious troubles, due largely to Japanese imports, was the tuna fishing industry. By June 30, 1955, California further solidified itself as the nation's second banking state, its 173 banks having 1,139 branches with assets of \$20,177,620,000.

With a 21.9% increase in its population since 1950, California continued in 1955 to give every indication of becoming one day the most populous state in the Union. At the end of World War II it had been believed that a sizable proportion of the influx contributing to this growth would be made up of elderly persons. This has not proved to be the case. In 1955, although the monthly stipend for old-age security cases was increased, dependency relief showed a downward trend. California's growing population seems to be generating its own prosperity. But accommodation of this population has obviously become California's central problem.

CAMEROONS. A former German colony in western equatorial Africa on the Gulf of Guinea, constituted in 1922 as two League of Nations mandates under separate British and French administrations, and in 1946 placed under United Nations trusteeship, with Great Britain and France as respective trustees.

French Cameroons, or Cameroun (Cameroons under French Administration).—This trust territory lies between the British Cameroons and French Equatorial Africa. Estimated area, 166,800; pop. (est. mid-1952), 3,121,000, including about 13,000 Europeans, mostly French. The natives are mostly Bantu tribesmen and Sudanic-speaking peoples. Yaoundé (est. 1952, 31,800) is the capital, and Douala the chief port. The territory is ruled by a French high commissioner aided by a Territorial Assembly of 50 members (32 elected by Africans and 18 by Europeans). Local administration is still largely by tribal chieftains in the north, while 13 townships and 52 elected rural district councils have been set up in the south. The territory sends 4 deputies and 3 senators to the French Parliament in Paris and 5 representatives to the Assembly of the French Union. The 1954 budget totaled 11,537 million francs CFA. In 1953 there were 1,336 primary schools (152,006 pupils), 23 secondary schools (3,008), and 27 technical schools (1,137).

Cacao, the chief cash crop, is cultivated mainly by native planters. Other commercial crops are palm kernels, coffee, sesame, bananas, and rubber. Minerals include rutile, gold, tin, copper, and molybdenite. To provide power for an aluminum plant scheduled to begin operations in 1957, the capacity of the hydroelectric plant at Edéa is being expanded from 20,000 kw. to 120,000. Exports in 1954 totaled 15,247 million francs CFA; imports, 16,266 million. Chief exports and quantities (in metric tons) were: cacao, 50,032; coffee, 11,399; bananas, 73,704; timber, 95,396; and palm kernels, 16,810. France took 51% of exports and provided 63% of imports. The territory has about 6,000 miles of all-weather roads and 313 miles of railways.

In the last week of May 1955, 50 persons were reported killed in native riots and French repressive actions arising out of demands by the Communist-led Cameroon People's Union for a united and independent Cameroons. The party, which petitioned the United Nations in 1955 for a native plebiscite on union of the trust territories, was outlawed by French High Commissioner Roland Pré in July.

British Cameroons or Cameroons (Cameroons under British Administration).—The territory under United Nations trusteeship comprises two mountainous strips, 700 miles in length, and 50 miles in average width, extending from Lake Chad to the Atlantic Ocean on the eastern frontier of Nigeria. The population of diverse African tribes was 1,438,999 at the 1952-53 census.

Previously administered with the Eastern Region of Nigeria, the former Cameroons and Bamenda provinces have been separated therefrom and since Oct. 1, 1954, have been known as the quasi-federal territory of the Southern Cameroons. It remains, however, a part of the newly formed Federation of Nigeria (q.v.), and has its own legislature and Executive Council. Approval by the governor general is required of legislative enactments. The northern parts (totaling 17,350 square miles), comprising sections of the Adamawa, Bornu, and Benue provinces of the Northern Region of Nigeria, continue to be administered with that region. Buca, the capital of Southern Cameroons and headquarters of the commissioner, lies on the slopes of Cameroon Mountain. Ports are Tiko, Bata, and Victoria.

Revenue in 1952-53 was estimated at £1,994,000; expenditure, £1,832,000 (£156,500 for colonial development and welfare, £245,100 for public works, £158,000 for education, and £307,000 for road construction). In 1953 there were 373 schools (35,780 pupils), 15 hospitals, 83 dispensaries, 9 maternity units, 6 rural clinics, and 4 leprosy centers. Subsistence production includes coco-yams, plantains, beans, cassava, corn, and rice. Cattle are raised in the Bamenda and Mambilla plateaus. Major exports (in metric tons) and their values from Cameroons ports in 1953 included cocoa (6,460, £1,611,000), rubber (2,070, £337,000), bananas (91,810, £3,005,000), palm kernels (4,570, £240,000), and palm oil (2,830, £192,000); total exports were valued at £5,571,900. Imports (principally of food, drinks, tobacco, textiles, vehicles, and machinery) were valued at £1,617,800 in 1953, including goods valued at £44,200 from the United States. The territory had 1,470 miles of motor roads in 1953. There are airfields at Tiko (all-season) and Mamfe (dry season).

CANADA. Largest in area among the countries of the Western Hemisphere and the second largest in the world, Canada comprises all of North America north of the United States, except Alaska, Greenland, and the French islands of St. Pierre and Miquelon. The capital is Ottawa (pop. 1951, 202,045) in the Province of Ontario.

Area.—The areas of Canada's provinces and territories, including land and fresh water areas, are shown in Table 1.

Population.—The population of Canada by provinces and territories, at the decennial cen-

¹ Census of 1945, 321,819; Newfoundland was not admitted into the federation until 1949.

The largest Canadian cities and their populations (1951 census) are: Montreal, 1,021,520 (metropolitan area, 1,395,400); Toronto, 675,754 (metropolitan area, 1,117,470); Vancouver, 344,833; Winnipeg, 235,710; Hamilton, 208,321; Ottawa, 202,045; Quebec, 164,016; and Edmonton, 159,631.

Urban-Rural Ratio.—In 1951 the urban population totaled 3,628,253, an increase over 1941 of 32.7%; while the rural population totaled 5,381,176, a rise of only 7.5% over 1941. Urban dwellers comprised 61.6% of the population in 1951. Canada's farm population totaled 2,827,732 in 1951, about 10% less than in 1941, and representing about 20% of the total population, as against 27% in 1941.

Vital Statistics.—The Canadian birth rate in 1954 was 28.7, the third highest on record; the death rate of 8.2 was the lowest on record and represented a decline of almost 20% in a little over a decade. The 1954 infant mortality rate of 32 (deaths per 1,000 live births) was also a record low, as was the maternal mortality rate of 0.7. Life expectancy at birth in 1950-52 averaged 66.3 years for males and 70.8 for females.

National Derivation.—According to the 1951 census, 85.3% of the population was Canadian born. Canadians of British origin numbered 6,709,685, or 47.9% of the total population; French origin, 4,319,167 (30.8%); other European origin, 2,553,722 (18.2%); and Asian origin, 72,827 (0.5%). Persons of Indian origin numbered 155,874 in 1951; Eskimos, 9,493; Negroes, 18,020.

Immigration.—In 1954 a total of 154,227 immigrants entered Canada (a drop of 9% from 1953), bringing the total since 1946 to 1,112,373. Of the 1954 total, 44,593 were from the United Kingdom and Ireland, 29,845 from Germany, and 24,595 from Italy. In 1954, certificates of Canadian citizenship were granted to 19,545 persons who formerly owed allegiance to other countries.

Religion.—Religious denominations and adherents, as shown in the 1951 census, were as follows (with percentage of total population in parentheses): Roman Catholic, 6,069,496 (43.3); United Church of Canada, 2,867,271 (20.5);

Church of England, 2,060,720 (14.7); Presbyterian, 781,747 (5.6); Baptist, 519,585 (3.7); Lutheran, 444,923 (3.2); Jewish, 204,836 (1.5); Ukrainian (Greek) Catholic, 190,831 (1.4); Greek Orthodox, 172,271 (1.2); Mennonite, 125,938 (0.9); other, 571,811 (4.1).

GOVERNMENT AND SOCIAL WELFARE

Government.—A member of the Commonwealth of Nations, Canada is a self-governing and fully independent nation. (The term "Dominion of Canada" is gradually being replaced by the term "Canada" in official and popular usage.) Canada's sovereign is Queen Elizabeth II. The government, based largely on the British constitutional system, is administered by a prime minister and a cabinet of departmental ministers who are members of the Parliament at Ottawa. The cabinet is responsible to the lower chamber, or House of Commons, and holds office as long as it retains the confidence of that body.

Governor General.—Executive power is nominally vested in a governor general appointed by the British crown on the advice of the Canadian cabinet, usually for a term of five years. The governor general, representing the British sovereign, acts under the advice of the Canadian ministry. Vincent Massey, the first Canadian-born governor general, took office on Feb. 28, 1952.

Judiciary.—The Supreme Court of Canada, composed of a chief justice and eight puisne judges, is the final court of appeal in both civil and criminal cases throughout Canada. Patrick Kerwin was appointed chief justice on July 1, 1954.

Parliament.—The Canadian Parliament consists of a House of Commons and a Senate. The influence of the Senate on legislation is considerably less than that of the House of Commons, in which most public bills are introduced and to which the ministry is responsible.

The Senate, or upper house, consists of 102 members appointed for life by the governor general on the advice of the ministry. It is composed of 24 senators from Ontario, 24 from Quebec, 10 from Nova Scotia, 10 from New Brunswick, 6 each from Newfoundland, Manitoba, Saskatchewan, Alberta, and British Columbia, and 4 from Prince Edward Island.

The House of Commons, or lower house, is elected for a five-year term, or less, if Parliament is earlier dissolved. Representation is based on population. On the basis of the 1951 census, the number of seats was increased from 262 to 265 in 1953. As a result of the general election of Aug. 10, 1953, and subsequent by-elections, party seating at the opening of the parliamentary session on Jan. 10, 1956, was as follows: Liberals, 170; Progressive Conservatives, 53; Co-operative Commonwealth Federation (CCF), 23; Social Credit, 15; and independents, 4.

Ministry.—Louis St. Laurent became prime minister on Nov. 15, 1948, succeeding W. L. Mackenzie King. St. Laurent is the leader of the Liberal Party, which came to power in 1935 and was re-elected in 1940, 1945, 1949, and 1953. The Canadian Ministry, in order of precedence in the Privy Council as of Jan. 1, 1956, was as follows:

Prime minister and president of the Privy Council—Louis Stephen St. Laurent.
Minister of trade and commerce and minister of defense production—Clarence Decatur Howe.
Minister of agriculture—James Garfield Gardiner.
Minister of national health and welfare—Paul Joseph James Martin.
Minister of national revenue—James J. McCann.
Minister of labor—Milton Fowler Gregg.
Secretary of state for external affairs—Lester Bowles Pearson.
Minister of justice and attorney general—Stuart Sinclair Garson.
Minister of public works—Robert Henry Winters.
Minister of veterans affairs and postmaster general—Hugues Lapointe.
Minister of finance—Walter Edward Harris.
Minister of mines and technical surveys—George Prudham.
Minister of fisheries—James Sinclair.
Minister of national defense—Ralph Osborne Campney.
Solicitor general and leader of the government in the Senate—William Ross Macdonald.
Minister of citizenship and immigration—John Whitney Pickersgill.
Minister of northern affairs and natural resources—Jean Lesage.
Secretary of state—Roch Pinard.
Minister of transport—George Marler.

Provincial Government.—Canada is composed of 10 provinces, the Northwest Territories, and the Yukon Territory. Provincial government is conducted along the same lines as the federal government. Each province has a lieutenant governor appointed by the governor general of Canada, its own executive council or cabinet, and a popularly elected unicameral Legislative Assembly; Quebec alone retains an appointive Legislative Council in addition to its Legislative Assembly. The Northwest Territories and the Yukon Territory are under the jurisdiction of the federal government. The Yukon Territory has a Territorial Council of five members elected for a three-year term, with a commissioner, appointed by the governor general, as chief executive. The Northwest Territories are administered by a commissioner appointed by the governor general, and aided by a Council of 9 members, of whom 4 are elected and 5 appointed. (See separate articles on the Canadian provinces and territories.)

Federal Budget.¹—For the fiscal year ended March 31, 1955 (with data for the fiscal year 1954 in parentheses), revenue totaled \$4,123,513,300 (\$4,396,319,583), and expenditure, \$4,275,362,888 (\$4,350,522,378), for a deficit of \$151,849,588 (for a surplus of \$45,797,205). Chief sources of revenue from taxation in the 1955 fiscal year were: income tax (including personal and corporate), \$2,265,297,267; sales tax, \$572,214,713; customs import duties, \$397,228,330; and excise duties, \$226,458,438. Expenditure for national defense totaled \$1,665,968,960 (\$1,805,914,922 in fiscal year 1954), representing 39% of total expenditure (41.5% in fiscal year 1954). Other major expenditure items included interest on the public debt, \$477,914,894; family allowances, \$366,465,965; and veterans affairs, \$240,089,187. The gross public debt as of March 31, 1955, totaled \$17,951,000,000; the net debt, \$11,263,000,000.

The draft budget for the fiscal year 1956 submitted to Parliament by Finance Minister Walter E. Harris on April 5, 1955, forecast revenue at \$4,202 million, and expenditure at \$4,362 million. (See also below, *The Year 1955 in Canada*.)

Defense.—As of Dec. 31, 1954, there were 117,003 men and women in Canada's active forces. Personnel was divided among the three services as follows (with reserves given in parentheses): Canadian Army, 49,447 (46,159); Royal Canadian Navy, 18,806 (5,418); and Royal Canadian Air Force, 48,750 (5,539). (See also NAVAL AFFAIRS.)

Social Welfare.—In June 1954, 725,239 persons over 70 years of age were receiving federal pensions of \$40 per month; an additional 93,592 needy persons between 65 and 70 were receiving old-age assistance payments averaging \$36.50 per month (with 50% of the cost paid by the federal government); and 8,210 blind persons were receiving allowances averaging \$38.91 per month (with 75% provided by the federal government). Federal payments under these three types of assistance totaled \$362,173,044 in the fiscal year 1954. Other federal programs include family allowances, veterans benefits, unemployment insurance, grants to provincial and municipal health programs, and aid to Indians and Eskimos. In the month of July 1955, 2,220,578 families received \$31,674,089 in monthly allowance benefits for 5,248,557 children, or an average of about \$6 per child. Beginning in January 1955 (under the Disabled Persons' Act of 1954), a joint federal-provincial allowance of not more than \$40 per month was paid to totally and permanently disabled persons not in hospitals or institutions. (See also the articles, CHILD WELFARE; MARRIAGE AND DIVORCE.)

¹ All monetary figures used in this article are in Canadian dollars, unless otherwise indicated. In 1954 the monthly average exchange rate of the Canadian dollar was U.S. \$1.027; in January–August 1955, U.S. \$1.019.

Education.—With the exception of Indian and Eskimo education, which is left to the federal government, education is the responsibility of the provincial governments. In the 1954-55 school year, enrollment in provincially-controlled elementary and secondary schools was estimated at 2,835,000; full-time enrollment on the university level, 63,000. The average annual salary of elementary school teachers in 9 provinces (Quebec excluded) was \$2,510 in 1952-53. Expenditures on formal education totaled \$515,972,000 in 1951 (federal, provincial, and private).

TABLE 3—CANADIAN EDUCATION STATISTICS
(Data for 1951-52)

Type of school	Schools	Teachers	Pupils
Provincially controlled:			
Elementary and secondary	30,710	93,694	2,502,403

1949-50	32,985	100,805	2,840,489

¹ Not included in the total; these courses are provided by the provincial departments of education. ² Including 1,321 in short courses. ³ Day and evening classes. ⁴ Excludes 212 part-time instructors. ⁵ Excludes 4,756 part-time instructors. (Source: Dominion Bureau of Statistics.)

Libraries.—Public libraries in Canada had an estimated total of 9,663,476 volumes in 1954, with total circulation amounting to 33,432,730. Borrowers numbered 1,672,774 in 1953. Expenditures for all public libraries aggregated \$8,540,373 in 1954, a rise of about 9.2% over the 1953 total. In addition to the public libraries, university and college libraries have about 7.4 million volumes in stock, and federal and provincial government libraries, about 2.7 million.

Crime and Delinquency.—Canadian courts in 1952 found 29,761 adults guilty of 41,591 indictable offenses. The courts adjudged 6,068 children delinquent, a record low rate. Canada in 1952 had 8 penitentiaries, 13 reformatory and corrective institutions (4 for women), and 27 training and industrial schools (12 for girls). Inmates of prisons, reformatories, and training schools totaled a record 16,383 at the end of 1953.

THE CANADIAN ECONOMY

Tendencies in 1955.—Recovery from the 1953-54 recession, already under way in late 1954, gathered further momentum during 1955. Overall production and consumption levels reached new peaks by the summer and fall. Industrial production during midsummer exceeded by 8% the previous record level of 1953. Manufactures, particularly durables, which had fallen most during the downturn, rose again in the spring of 1955. Production of automobiles and trucks in the first 10 months of 1955 totaled 395,938 units, a rise of over 22% above output in the like period of 1954. The midyear survey estimated new plant and equipment expenditure at \$5,954 million in 1955, 8% above the \$5,507 million of 1954. Construction boomed in 1955. By the

end of September, the dollar value of construction contracts awarded had exceeded the total for all of 1954. Foreign trade in the first 9 months of 1955 was about 12% over that of the like period of 1954, a notable feature being the improvement in exports to the United Kingdom. The one important exception to these expansive tendencies was agriculture. Farm income continued to decline, falling about 3% in the first half of 1955, as compared with the first half of 1954, and about 13% as compared with 1953. The major farm problem, as in other recent years, was the marketing of the wheat crop, which, at about 494 million bushels, was some 60% greater than the meager 1954 yield.

National Income and Product.—The gross national product in 1954 fell nearly 2% from the record 1953 level. The decline was in marked contrast to the gains of the previous few years and was attributed to a slackening in domestic and foreign demand and a large reduction in the western grain crop. Manufacturing, especially durable goods output, fell off, although expansion continued in services and mining.

Despite increased unemployment, aggregate income from salaries and wages rose by more than 2% in 1954, due to higher rates of pay. Labor income constituted about 64% of national income in 1954, as compared with 58% in 1951. Net farm income declined about a third from the 1953 level. In the investment income category, corporation profits showed a slight decline, while income from interest and rents rose about 12%. On the expenditure side, consumer expenditure and residential construction showed moderate gains, while government expenditure was virtually constant. Net inventory accumulation dropped sharply into the negative column. Exports, nonresidential construction, and investment in new machinery and equipment also showed declines from 1953.

TABLE 4—CANADIAN NATIONAL PRODUCT
AND EXPENDITURE^a
(In millions of dollars)

Item	1952	1953	1954
GROSS NATIONAL PRODUCT			
Wages, salaries and supplementary labor income	10,868	11,706	11,989

Gross national expenditure at market prices	23,255	24,449	24,041

* Revised.

Manufacturing.—The general index of industrial production (base: 1935-39 = 100) fell from

248.4 in 1953, to 244.6 in 1954, or 1.5%. The index for manufactures fell by 4.4%, while that of mining rose by almost 13%. Outputs among the important manufacturing industries which showed significant declines in 1954 were: steel ingots, 3,113,822 tons (a fall of 22%); passenger cars (factory shipments), 287,191 (down 20%); and footwear, 37,158,696 pairs (down 5.4%). Virtually the only major durable to show a rise in 1954 was television sets, whose 611,206 units represented a 64% gain over 1953.

About a third of Canada's annual income is earned in manufacturing, or twice as much as in agriculture. Manufacturers' shipments in 1954 (prelim.) had a total value of \$17,497.8 million, down about 2% from the record \$17,785.4 million of 1953. Chief manufacturing industries and estimated 1954 gross output in millions of dollars (with 1953 figures in parentheses) were: foods and beverages, \$3,527.9 (\$3,491.9); iron and steel products, \$1,933.6 (\$2,099.6); transportation equipment, \$1,718.8 (\$2,089.9); paper products, \$1,629.9 (\$1,568.3); wood products, \$1,228.5 (\$1,242.0); and nonferrous metals, \$1,264.9 (\$1,242.0).

Building and Construction.—Capital expenditure on new construction (governmental and private) totaled a record \$3,696 million in 1954 (prelim.), as compared with \$3,665 million in 1953. Residential construction in particular set new marks in 1954. New dwelling units completed numbered a record 101,965 (5.3% over 1953), while starts totaled 113,527 (up 10.9%). Nonresidential construction showed a decline in total value from \$1,706 million in 1953, to \$1,676 million in 1954. Repair construction in 1954 totaled \$994 million (prelim.). In the first half of 1955, housing starts numbered 57,997 (up 25% over the first half of 1954); units completed, 52,228 (up 26%).

Retail Sales.—Sales of retail stores in 1954 (prelim.) amounted to \$11,959,153,000, or 1.4% below the record 1953 figure of \$12,125,802,000. The 1954 decline was confined to independent stores, whose sales dropped to \$9,825,167,000, from \$10,077,574,000 in 1953. In contrast, sales of retail chain stores rose to \$2,133,986,000, from \$2,048,228,000 in 1953.

Labor.—The civilian labor force averaged 5,426,000 in 1954. Of this number, a monthly average of 232,000 were without jobs and seeking work (137,000 in 1953). Weekly wages in manufacturing industries averaged \$57.16 in 1954, a rise of 1.9% over 1953, while average hours worked per week was 40.6, a fall of 1.7%. Time lost in labor disputes totaled 1,475,200 man-working days in 1954 (1,324,700 in 1953). Labor union membership as of Jan. 1, 1955, totaled 1,268,207.

The consumer price index (base: 1949 = 100) averaged 116.2 in 1954 (115.5 in 1953), and stood at 116.8 as of Sept. 1, 1955. (See also COST OF LIVING.)

Corporate Profits and Dividends.—Corporate profits before taxes in 1954 (prelim.) totaled \$2,390 million (\$2,580 million in 1953); profits after taxes, \$1,230 million (\$1,354 million in 1953). Dividends paid out (including charitable contributions by corporations) amounted to \$659 million in 1954 (prelim.), as compared with \$628 million in 1953.

Personal Savings.—A direct estimate by the Bank of Canada placed personal savings at \$1,297 million in 1954 (prelim.), as compared with \$1,737 million in 1953. Personal savings deposits in chartered banks totaled \$5,218 million at the

end of 1954, rising to \$5,696 million as of Aug. 31, 1955.

Agriculture.—Occupied farms in Canada numbered 623,091 in 1951, a decrease of 9% from 1941 (using the 1951 definition of a farm). About 15.5% of Canada's labor force was directly engaged in farming in 1954. Gross farm income in 1954 (prelim. est. \$2,624.7 million) comprised about 11% of gross national product.

Farm Income.—Farm cash income from the sale of farm products and from participation payments totaled \$2,377.8 million in 1954 (prelim.), a substantial fall from the \$2,776 million in 1953. The decline was due largely to a lower return for field crops (especially wheat) and eggs, which outweighed an increased return from livestock and dairy products. Net income from farming operations totaled \$1,125.6 million (\$1,699.6 million in 1953).

Farm Output.—The index of the physical volume of agricultural output (base: 1935–39 = 100) was 114.3 in 1954 (prelim.), down sharply from the 156.2 of 1953. Due chiefly to the smaller wheat crop, the gross value of production of principal field crops in 1954 (prelim.) was \$1,138 million, as compared with about \$1,800 million in 1953.

TABLE 5—PRODUCTION AND ACREAGE OF
PRINCIPAL CANADIAN FIELD CROPS¹
(Figures in thousands)

Crop	Production		Acreage	
	1954	1955 ²	1954	1955 ²

Sugar beets (tons)	1,004	933	90	82

¹ Not including Newfoundland. ² November estimate. (Source, Dominion Bureau of Statistics.)

The value of the 1954 commercial fruit crop was estimated at \$48.7 million. November estimates of 1955 fruit crops were: (in bushels) apples, 19.5 million; pears, 1.5 million; plums and prunes, 780,000; peaches, 2.9 million; apricots, 218,000; cherries, 544,000; (in quarts) strawberries, 22.7 million; raspberries, 10.96 million; (in pounds) loganberries, 1.5 million; and grapes, 86.5 million. Production of leaf tobacco in the crop year ending Sept. 30, 1954, totaled 184.8 million pounds.

Dairy, Livestock, and Poultry.—Milk production in 1954 (prelim.) totaled 16,884 million pounds; butter (factory production), 141,600 metric tons; and net egg production, 392.4 million dozen. As of June 1, 1955, cattle on farms numbered 10,239,000; sheep and lambs, 1,722,000; hogs, 6,079,000; horses, 901,000; and poultry, 66,214,000 birds. (See also MEAT INDUSTRY.)

Mineral Production.—Canada is the world's largest producer of nickel, asbestos, and platinum. It ranks second in aluminum, gold, zinc, uranium, magnesium, and titanium, and third in silver, cadmium, and cobalt. The total value of mineral production in 1954 (prelim.) was \$1,444.2 million, up 8% from the previous record

NATIONAL DEFENSE PHOTO

A Royal Canadian Air Force radar station, vital link in the country's defenses against hostile air attack.

of \$1,336.3 million in 1953. Production of crude petroleum in 1954 was 96 million barrels (up 17.5% over 1953), and provided 47% of the nation's domestic consumption (21.3% in 1950). Alberta alone provided 87.7 million barrels of the 1954 output. Canada's mineral industry employed 130,038 persons in 1953. (See also **IRON AND STEEL**.)

* Preliminary. (Source: Dominion Bureau of Statistics.)

Forestry.—Canada's vast forests include an estimated 578,000 square miles of woodlands considered accessible for economic exploitation. Canada is the world's leading producer of newsprint, and ranks second in wood pulp and third in sawn lumber. The cut of merchantable timber in 1952 was estimated at 3,565.6 million cubic feet, valued at \$815,651,000. Output of wood pulp in 1954 was estimated at 9.5 million tons; newsprint, 5.9 million; and sawn lumber (1953), 7,305,958,000 feet board measure. (See also the articles, **FORESTRY**; **LUMBER**.)

Fisheries and Furs.—Canada is a leading fish exporter, fisheries products exported in 1954 reaching a record value of \$132.7 million. Chief species caught are cod and lobster in the Atlantic, whitefish and lake trout in inland waters, and halibut and salmon in the Pacific. Landings of sea fish in 1954 totaled 1,900.5 million pounds valued at \$82,762,000. Of the total volume, Atlantic waters provided 1.3 billion pounds.

Pelts taken in the 1953-54 fur season num-

bered 6,275,000, valued at \$19,288,000. Mink accounted for 58% of the total value; muskrat, 16%; and beaver, 13%. Animals on fur farms at the beginning of 1954 numbered 321,057 (including 299,433 mink); and pelts from fur farms accounted for 49% of the total pelt value in 1953-54.

Electric Power.—Canada's abundant water power resources (with only about 25% of known resources thus far developed) afford Canadians one of the world's lowest rates for electric service. Capacity turbine installation of hydroelectric power totaled 16,684,131 hp. at the end of 1954, with new capacity added during the year amounting to 1,758,450 hp. Production of electric energy by central electric stations reached a record 69,136.6 million kw.-hr. in 1954, about 5.6% over 1953 output. (For 1955 developments regarding the St. Lawrence Seaway and Power Project, see the articles, **CANALS**; **DAMS**.)

Foreign Trade.—Canadian exports in 1954 totaled \$3,946.9 million (including re-exports of \$65.6 million), a decline of 5.4% from the 1953 level. Imports amounted to \$4,093.2 million,² a drop of 6.6%. Thus for the first time since World War II, the value of Canada's foreign trade showed a decline. Due to the greater drop in imports, Canada's deficit on commodity trade was reduced to \$146.3 million in 1954, from \$210.2 million in 1953.

The United States purchased 60% of Canada's 1954 exports; the United Kingdom, 16.7% (59% and 16%, respectively, in 1953). The United States provided 72.3% of Canada's 1954 imports; the United Kingdom, 9.6% (73.5% and 10.3%, respectively, in 1953).

Canada's 10 leading domestic exports and values (in thousands of dollars) in 1954 were: newsprint paper, \$635,670; wheat, \$375,339; planks and boards, \$324,724; wood pulp, \$271,418; aluminum (primary and semifabricated), \$182,392; nickel (primary and semifabricated), \$182,154; copper (primary and semifabricated), \$127,334; barley, \$89,363; wheat flour, \$88,029; and asbestos (unmanufactured), \$82,566.

² The change in the import coding month in June 1954 increased the value of imports recorded in the year by an amount estimated at not less than \$40 million, and total trade and the trade balance by the same amount.

Uranium City, a thriving town of 1,000 in the heart of the Beaverlodge uranium area in northern Saskatchewan.

Canada's 10 leading imports and values (in thousands of dollars) in 1954 were: nonfarm machinery and parts, \$380,219; petroleum (crude and partly refined), \$212,787; electrical apparatus, \$207,539; automobile parts (except engines), \$180,433; aircraft and parts (except engines), \$100,397; rolling mill products, \$97,563; internal combustion engines and parts, \$84,914; tractors and parts, \$82,814; fuel oils, \$70,921; and bituminous coal, \$70,445. (See also the articles, INTERNATIONAL TRADE; TOURISTS.)

¹ Excluding gold. ² Excluding transfers of defense equipment and supplies to North Atlantic Treaty countries under the Defense Appropriation Act. ³ The change in the import coding month in June 1954 increased the value of imports recorded in the year by an amount estimated at not less than \$40 million. (Source: Dominion Bureau of Statistics.)

Balance of Payments.—Canada had a deficit on current account of \$431 million in 1954 (prelim.), slightly less than the \$443 million deficit of 1953. The small surplus of \$13 million on commodity account, plus the \$155 million in gold available for export, was more than offset by negative balances on travel, interest and dividends, freight and shipping charges, and other invisibles. The current account deficit with the United States fell from \$904 million in 1953, to \$812 million in 1954. The chief development on capital account was a decline in net inflow of capital for direct investment to \$376 million in 1954, as compared with \$428 million in 1953. Short-term transactions were virtually in balance

in 1954, as compared with a net outflow of about \$248 million in 1953. Official reserves of gold and United States dollars reached a new high of U.S. \$1,942.6 million at the end of 1954, falling to U.S.\$1,936.7 million as of Sept. 30, 1955.

Transportation and Communications.—At the end of 1953, Canada had 517,809 miles of roads, of which 190,997 was surfaced (as of March 31, 1954). Registered motor vehicles in 1954 totaled 3,644,589, including 2,688,465 passenger cars. Expenditures by all authorities on roads and highways outside urban areas totaled \$397,068, 159 in 1953, 1.8% below the record total spent in 1952.

Railroads.—Canada ranks third behind the United States and Soviet Russia in total railroad mileage. Track mileage of Canadian railways at the end of 1953 totaled 58,694.7 route miles, with main, or single-track mileage amounting to 43,162.8. The two major systems, both transcontinental, are the government-owned Canadian National Railways (24,155 miles operated in 1954) and the privately owned Canadian Pacific Railway (17,003). Operating revenues of the 17 largest systems totaled \$1,087.1 million in 1954 (down 9% from 1953); operating expenses, \$1,013.9 million (down 7%); and net operating revenue, \$73.1 million (down 29%). Railroad employees numbered 196,307 in 1954.

Commercial Aviation.—The chief scheduled operators are the Trans-Canada Air Lines (owned by the Canadian National Railways) with 19,331 miles of domestic and international routes in 1954; and the Canadian Pacific Air Lines, Ltd. (owned by the Canadian Pacific Railway) with 10,723 miles of domestic and 20,676 miles of international routes. There are also several smaller scheduled and nonscheduled lines. Canada in 1955 had 84 airports of national or international importance. (See also AERONAUTICS.)

Shipping.—Vessels on the Canadian shipping registry (including vessels for inland navigation) numbered 16,181 with a net tonnage of 1,694,715 at the end of 1953. Canada's network of canals provides navigation for about 1,900 miles inland from salt water. The greatest share of traffic is carried by the Welland Ship Canal, the St. Lawrence River canals, and the Canadian Sault Ste. Marie Canal. Freight transported through Canadian canals in the 1954 navigation season totaled 30.1 million tons, down 9.9% from 1953.

Communications.—Canada's 7 telegraph systems in 1953 operated 445,532 miles of telegraph wire in Canada. Telephones in use at the end of 1953 numbered 3,606,407, a record 254,041 having been installed during that year. In 1954, Canada had 171 AM broadcasting stations, 33 FM stations, and 37 short-wave stations. Radio sets numbered 4.1 million in 1953. Canada had 28 TV stations in 1955, with 8 more under construction. Over 40% of Canadian families had TV sets in 1955, and over 75% of the population had access to TV broadcasting. Over 1.4 million TV sets were in use as of March 1955. Canada had 92 daily newspapers in the English and French languages in 1954, with a total circulation of 3,629,000. Post offices numbered 12,202 on March 31, 1954. (See also MAGAZINE PUBLISHING.)

M. J. G.

THE YEAR 1955 IN CANADA

In 1955 Canada resumed the march of prosperity and expansion which had been temporarily interrupted by the slight recession of 1954. But

WIDE WORLD

Canadian Parliament is televised for the first time at opening session, Jan. 17, 1955 (camera at upper right).

the failure of agriculture to share fully in this prosperity was producing a growing unrest among the farmers, especially in the wheat-growing areas on the prairies. Several unsettled strikes and the threat of trouble between the railways and their employees indicated that high employment did not remove all labor difficulties. In external relations several unsolved difficulties with the United States loomed up; while internally the working of the federal system produced a renewal of differences between federal and provincial governments.

Domestic Politics.—The long session of Parliament in Ottawa, which did not close until July 27, was generally agreed to have been unusually dull; but it was marked by some developments of importance. Changes in the rules were made to limit future debates on the address and on the budget (the two which ordinarily waste most time in the session) to ten days and eight days, respectively. It is in these debates that every private member has, in the past, felt it desirable to speak in order to prove his energy to his constituents. An estimates committee was also set up to examine the financial estimates of government departments for the forthcoming year, and it accomplished useful work. One of the stock criticisms of the functioning of parliamentary government has been that the supposed parliamentary check on governmental expenditures has become largely a sham.

What made the session chiefly notable, however, was the recovery of the Conservative Party, the chief opposition. In recent years the party has been ineffective, and the leadership of George Drew, much criticized. In this session it found an issue and exploited it most successfully. In

1950, on the occasion of the Korean War, a Defense Production Act was passed giving the government special powers, over a 5-year period, in dealing with private industry and with the economy in general. The government now proposed to extend the act indefinitely. But the Conservative Party launched a vigorous attack on this aggrandizement of governmental power in peacetime, and staged a filibuster under Mr. Drew's personal leadership. In the end the government was forced to yield and to limit the extension of the act to three years, until July 31, 1959. This was a special defeat for Clarence D. Howe, the minister of defense production, who has been the dominating member of the cabinet next to the prime minister, Louis St. Laurent. The whole incident damaged the prestige of the Liberals, who have been in office continuously since 1935. The Conservatives were correspondingly encouraged.

Of the other two opposition parties, the Co-operative Commonwealth Federation (CCF) appeared to be in a state of continuous decline. It fared very badly in the two provincial elections, in Ontario and Alberta, during the summer; and early in the session at Ottawa, on the question of approving the rearming of West Germany and its admission into the North Atlantic Treaty Organization (NATO), the party was split wide open. M. J. Coldwell, its leader, supported the government's Western policy, but he was deserted in the debate and the division by most of his followers, who manifested a mixture of pacifism and Communist sympathy.

The Social Credit Party remained undistinguished and doctrinaire in its contributions to parliamentary debate. In Alberta, the original

center of the party's strength, the provincial Social Credit government suffered a setback in the election which was called in June. For the first time since the late William Aberhart swept the province in 1935 with his new Social Credit gospel, an opposition of some strength was elected. The Alberta election was brought on by charges made by the provincial Liberal Party leader of improper dealings between Social Credit members of the legislature and government treasury branches. On June 29 the government was returned, but with only 38 (compared with 52 before dissolution) of a total of 61 seats. Its popular vote fell by 9%, and there was now a Liberal opposition of 15 members. Rural constituencies accounted for most of the government's losses.

In Ontario the Conservative government of Leslie Frost appealed to the people on June 9, and was triumphantly returned, winning 83 seats against 10 to the Liberals and 3 to the CCF.

Four by-elections for vacant seats in the federal Parliament took place on September 26. Three of these, in Quebec Province, returned Liberal candidates to replace old Liberal members. The fourth, Restigouche-Madawaska, in New Brunswick, a constituency that had been Liberal for over 20 years, returned a Conservative.

The Budget.—On April 5 the federal minister of finance, Walter Harris, introduced his annual budget. He was able to announce some remarkably large tax reductions, considering that they came in a year with no general election in the offing. But the notable feature of the budget was the formula propounded by the minister as the basis on which taxation should be calculated. He estimated that business recovery since the recession of 1954 would continue through 1955, and would result in a gross national production for the year of over \$26 billion. In 1953 production had reached \$24.4 billion, and in 1954 it had decreased to \$24 billion. On this basis he arranged his taxes so as to bring in a revenue which he calculated would fall short of expenditures during the fiscal year by \$160 million. At the time, this estimate of rising prosperity was rather bold, but the figures for the later months of 1955 seem to have justified it. Rising production will presumably make possible still further reductions in taxation in 1956.

For the current year personal income taxes were reduced by an average of 10%, beginning July 1. Corporation taxes on companies with incomes of more than \$20,000 were reduced from 47% to 45%. The 15% excise tax on new cars was reduced to 10%, and the tax on tires and tubes was repealed completely. The current sales tax of 10% was left unchanged, as was the 15% excise tax on television and radio sets (used to finance the Canadian Broadcasting Corporation), and the taxes on liquor, beer, wines, tobacco, soft drinks, and candies. Except for a new tariff of 7.5% on antifreeze, no tariff changes were made. The government resisted the drive of the textile interests for tariff increases. It announced that the Tariff Board would inquire into the iron and steel duties.

Mr. Harris also announced the establishment of a royal commission, headed by Walter Gordon of Toronto, to investigate Canada's economic prospects. The commissioners have been travelling across Canada receiving evidence from interested parties; a strong secretariat has been working in Ottawa doing independent research for the group.

Canadian-United States Relations.—Several matters of importance came up during the year that affected the relations of the two North American neighbors.

Early in the year the crisis in Formosa appeared to be placing a rather severe strain on good relations between the U.S. Department of State and the Canadian Department of External Relations. Lester B. Pearson, secretary of state for external affairs, created some excited discussion inside Canada by a remark in a speech in Toronto on March 24 that Canada would be bound to join the United States in any major war in which the latter became involved. But he very explicitly announced Canada's noninvolvement in any local fighting over Quemoy and Matsu islands. The general tone of Canadian discussion of the Formosan issue was very critical of American policy. Canada withdrew the last of its troops from Korea during the year, and had already refused to participate in the South-east Asia Treaty Organization (SEATO), although Britain, Australia, New Zealand, and Pakistan, all members of the Commonwealth, had joined.

The temporary easing of international strains produced by the Geneva Conference (q.v.) of the heads of government in July was very welcome in Canada. One result of the Geneva thaw was the official visit to the USSR, in October, of Mr. Pearson, accompanied not merely by a staff of officials from the Department of External Affairs, but also by a group of Canadian newspapermen, whose reports about the Soviet Union were unexpectedly enthusiastic. The party went on to Singapore, where Mr. Pearson took part in a conference of the Colombo powers, and then to India and Pakistan.

At the U.N. General Assembly meetings, the Canadian delegation played a leading part by sponsoring, on November 16, a package deal for the admission of 18 new members to the United Nations (16 were admitted on December 14). This policy also produced differences with the United States, which opposed the admission of the Mongolian People's Republic, a Soviet satellite.

In local North American affairs the main cause of friction between the two neighbors was wheat. The Canadian government and Canadian wheat farmers both felt strongly that the U.S. Department of Agriculture, in giving away stocks of wheat from its accumulated surplus to needy countries, or selling them for local currencies, was limiting Canada's opportunities for selling its surplus wheat. At meetings of representatives of the two governments in Ottawa and Washington, very frank discussions took place, but the only concession to Canadian arguments seemed to be a promise by the United States that it would keep the Canadian government informed of the monthly amounts of wheat disposed of under its program. Canadian concern was the greater because the huge Canadian surplus had filled all the elevators, thus causing most of the current wheat crop to be retained by the farmer on his own farm, which meant that he received no revenue from it. The government's plan of guaranteeing a bank loan at 5%, up to a maximum of \$1,500, to each farmer was being denounced in western Canada as wholly inadequate to meet the prairie crisis.

Natural gas provided another issue with possibilities of clash between the policies of the two governments. On the Pacific coast the U.S. Federal Power Commission announced in November

its authorization to import 300 million cubic feet of gas per day from Canada. Inside Canada the main interest was centered on the trans-Canada gas pipeline project from Alberta to Ontario. The private company (United States controlled) which was undertaking this project failed to raise sufficient capital, and requested the Canadian government to guarantee its bonds. Over this there was a dispute, apparently, in the cabinet between Mr. Howe, the chief supporter of the all-Canadian line, and the same group of ministers who had opposed him on the Defense Production Act. After long negotiations, imperfectly reported in the press, it was finally announced in the fall that the federal and Ontario governments had agreed to build the 700-mile pipeline across the unprofitable area of northern Ontario and to lease it to the private company, Trans-Canada Pipe Lines Ltd., with the option of purchase by the company later on. The whole scheme still depended on the ability of the company to persuade the U.S. Federal Power Commission to permit the export of Canadian gas from a branch line reaching the border at Emerson, Manitoba. Without this immediate United States market the prospects of the line, during the years in which it was building up a market in the Toronto and Montreal areas, seemed fairly bleak.

Dominion-Provincial Relations.—The federal government has agreements with all the provinces, except Quebec, by which it "rents" from the provinces the exclusive use of personal income taxes, corporation income taxes, and succession duties, and in return pays them an annual sum in compensation. Quebec has obstinately insisted in raising its own income taxes, even though it might have benefited financially by an arrangement with Ottawa; its isolation has encouraged extreme antifederal sentiment in the province, which the federal government, headed by a Quebec citizen, is anxious to allay. The cold war between Ottawa and Quebec was eased slightly in 1954, and in 1955 the federal government attempted to make a new tax arrangement with the province to take the place of the rental agreements due to expire in 1957.

In October, at a conference of governments, the federal government proposed what became known as Plan C, by which any province might resume the collection of income taxes and succession duties up to a certain standard level. A calculation would be made of how much these taxes produced per capita in Ontario and British Columbia, where they are most lucrative; and a grant would be paid to each province equivalent to the amount by which its taxes fell short of the Ontario-British Columbia standard. Whether the provinces would accept this scheme or some modification of it was not clear at the end of the year.

Late in 1955 another troublesome issue was assigned to investigation by a royal commission. The division of functions in radio and television broadcasting between the public Canadian Broadcasting Corporation (CBC) and private stations is to be studied by a commission headed by Robert Fowler of Montreal. Under present arrangements the CBC not only produces programs itself, but also has a regulatory authority over private broadcasters, and enjoys a monopoly of television stations in the large cities. The private interests, supported by most of the newspapers and the Conservatives in general, have been conducting a campaign against this situation. The Co-operative Commonwealth Federa-

CANADIAN LITERATURE. Novels.—The 1955 crop of novels was disappointing in quantity, mystifying in content, and only faintly reassuring in quality. Strangely enough, veteran novelists were thoroughly overshadowed by tyros. William R. Bird, the Nova Scotian, was one veteran who remained true to his form. His curiously titled *The Shy Yorkshireman* was nevertheless a novel largely about Nova Scotia, and its best chapters captured the savor of Nova Scotian country life just before and after World War I.

It was certainly typical that the novelists of 1955 drew, rather obviously, upon personal experiences. This characteristic featured nearly all of the work of the year's first-novelists. Best of the group was Magdalena Eggleston, who went back to her childhood experiences in the coal mining areas of Alberta for the background of *Mountain Shadows*, a novel with the Canadian racial melting-pot theme, which she handled with considerable sympathy. Gale Taylor's account of Doukhobor conflicts, forthrightly described in *Anastasia's Daughter*, was based on an early contact with Doukhobor life in Canada following the arrival of that group in 1899. Hubert Evans' angry criticism of Indian racial discrimination in British Columbia, in *Mist on the River*, also arose from his personal contact with life in the coastal canneries.

Because of their extensive use of personal material, it was difficult to know whether Evelyn Weller's spirited *Cardinal Road*, which neatly dramatized the evolution across a generation of her Toronto home-street, and Mary Hiemstra's

Gully Farm, which just as neatly dramatized pioneering with the Barr colony in Saskatchewan, were novels or autobiographies.

The neglect of historical themes in 1955 was mystifying, but two good historical novels did appear. One was Jan Hilliard's humorous treatment of Nova Scotia's Inverness, called *A View of the Town*, as it took root back in 1781; the other was E. M. Granger Bennett's broader-scaped study of French Canada in 1617, in the persons of the Louis Hebert family, called *Land for their Inheritance*.

The two novels of 1955 which tinged personal experiences with the universal, and which therefore created the most stir, were written by Canadians not resident in their native country. Mordecai Richler, of London, England, plunged into a Jewish area of Montreal for the material for his *Son of a Smaller Hero*, an arresting study of rebellion against the traditions of Judaism. Lionel Shapiro, of New York City, erected, upon the superstructure of his experiences as a newspaper correspondent during World War II, a timeless façade of personal tensions from war-shattered personal loyalties, entitled *The Sixth of June*.

Poetry.—Verse continued in 1955 to be literature's poor cousin in Canada, but there was considerable historic interest in *Poems of John Galt*, selected by George H. Needler, and *The Selected Poems of Bliss Carman*, edited with an introduction by Lorne Pierce.

Biography and Memoirs.—The annual output of biography is normally considerable in Canada. The 1955 production ranged from Captain Vancouver's *Adventures in Two Hemispheres*, by James S. Marshall, to Marilyn Bell's *Swim to Glory*, by Ron McAllister. There were also Donald G. G. Kerr's scholarly study of a lieutenant governor, *Sir Edmund Head*; W. S. MacNutt's human-interest study of a governor general, *Days of Lorne*; and Donald Creighton's monumental study of a prime minister, *John A. Macdonald: The Old Chieftain*. Biographies of current figures included Elsie MacGill's lively recreation of Judge Helen MacGill in *My Mother, the Judge*; Irene McElheran's inspiring description of her archdeacon husband's life in *That's What I'm Here For*; Roland Wild's memorable account of Captain Smellie's Arctic voyages in *Arctic Command*; and Nan Shipley's triumphant life of a Canadian missionary in *Anna and the Indians*. One of the best biographical books of 1955 was a study of six western Canadian leaders, by Roy St. George Stubbs, who drew, with gifted gusto, lifelike *Prairie Portraits* of editors, lawyers, judges, and politicians.

Memoirs were in short supply in 1955, but three of unusual merit did appear. Their diversity was striking. Will Dawson, journalist sailing in British Columbia waters, published *Ahoy There!*; Lex Schrag, a journalist, described gentleman farming in *Mortgage Manor*; and E. M. Ashworth, engineer who pioneered in electricity, wrote of his *Toronto Hydro Recollections*.

Outdoors and Travel.—A modest collection of these books appeared, generally of good quality. Among the best were: *Skin Diving and Exploring Underwater*, by John Sweeney; *Last of the Curlews*, by Fred Bodsworth; *Upland Trails*, by Dan McCowan; and *Silken Lines and Silver Hooks* (fishing lore and reminiscences), by W. Sherwood Fox. A variety of workmanlike travel books appeared. They included: *Highway to the North* (Alaska), by Frank Illingworth; *Regina: The Queen City*, by Earl Drake; *Ottawa:*

Portrait of a Capital, by Blodwen Davies; and *The Mont Tremblant Story* (ski resort), by John and Frankie O'Rear.

History.—Canadian history continued to attract writers. Some authors preferred the traditional large canvas, but more and more books were appearing, by 1955, on segments and corners of Canadian history. Bruce Hutchison's *The Struggle for the Border* and Chester Martin's *Foundations of Canadian Nationhood* were extensive in scope, and their appeal was mainly academic. The more restricted historical works, especially when splashed with bold colors, had wider appeal. Illustrative of these were Farley Mowat's *The Regiment* (the "Hasty P's"), Philip Godsell's *Pilots of the Purple Twilight* (bush flying), Anna Montreuil's *Three Came with Gifts* (first school, first hospital, and first cloister in Canada), and James F. C. Wright's *Saskatchewan: The History of a Province*.

Varied Nonfiction.—As usual the output of varied nonfiction dwarfed fiction and all the other categories of nonfiction put together. Such nonfiction ranged from Eric Nicol's rib-tickling *Shall We Join the Ladies?* to Karl Stern's sober *The Third Revolution* (which was that prompted by Sigmund Freud).

Children's Books.—It was mystifying that juvenilia, which for two previous years had been riding a crest, should dip into a production trough in 1955. The relatively few works published included Marianna MacDonald's second novel, *Smugglers' Cove*, which was set in New Brunswick; John Craig's first novel, *Wagons West*, with prairie pioneering action; Edward McCourt's *Buckskin Brigadier*, who was Gen. Thomas B. Strange of Riel's Rebellion; and Eva-Lis Wuorio's *Return of the Viking*, which mixed fantasy and history in equal proportions. (See also PRIZES AND AWARDS—Literature; THEATER.)

CHARLES CLAY,
Former National Secretary, Canadian
Authors Association.

CANAL ZONE. See PANAMA CANAL.

CANALS. St. Lawrence Seaway.—In 1955 the first full year of construction proceeded on the International Rapids section of the St. Lawrence Seaway. Other work done over the years along other sections of the river will all go into the 27-foot canalization of the entire river from Lake Ontario to Montreal. But until ground was finally broken on Aug. 10, 1954, the picturesque International Rapids between Cornwall, Ont., and Massena, N.Y., had not been touched since the 14-foot Cornwall Canal was built to bypass them many years ago. With deep-draft (27-foot) canalization of the St. Lawrence begun at these rapids, the work proceeded at a fast pace in 1955.

As ultimately evolved, the seaway work is being handled separately and distinctly from hydroelectric power development of International Rapids. Yet it is important to understand that the seaway development is totally dependent on the power project. Actually, there is a \$660 million power project being built jointly by the New York State Power Authority and the Hydro-Electric Power Commission of Ontario (see also DAMS). The pools to be created behind the dams and powerhouse of this project make it feasible at last to go ahead with navigation locks, channel improvements, and a 10-mile cross-country canal. This all adds up to a \$100 million portion of the St. Lawrence Seaway as it will exist by 1958

through the Ogdensburg-to-Cornwall stretch of the river.

Hardly had ground been broken for the power project when seaway work on the United States side began. The St. Lawrence Seaway Development Corporation is the government agency involved, with the U.S. Army Corps of Engineers designated as construction agent. On the Canadian side of International Rapids, Canada's St. Lawrence Seaway Authority is the administrative agency. This Canadian organization has a lock at Iroquois—near the head of the rapids—well under way. It will bypass Iroquois Dam, a control structure in the power development project.

The 10-mile canal being cut across country near Massena, N.Y., will bypass both Long Sault Dam, major control structure, and Barnhart Island Powerhouse. It is called Long Sault Canal, and its two locks are Robinson Bay Lock and Grass River Lock. These two structures will provide a total lift to account for the 81-foot rise in river level behind the power structures. Both locks will be 80 feet wide and 860 feet long between upstream and downstream gates.

At the end of 1955, excavations for these locks were nearing completion, and excavation on the 10-mile canal connecting them was well started. Construction is on a very tight schedule, timed as it is to the abandonment of existing Cornwall Canal in 1958, when the new power pool is expected to be let rise behind Long Sault Dam and the Barnhart Island Powerhouse. In the meantime, no construction along this busy length of the river must be allowed to affect appreciably either the 14-foot depth in Cornwall Canal or the level of Lake Ontario. Close coordination is demanded of the engineering involved.

Upstream, from the International Rapids to Lake Ontario, there is only relatively minor dredging to be done in the Thousand Islands section of the St. Lawrence. Downstream, totally within Canada, there remains much to be done to create the seaway past both Soulanges and Lachine rapids. To connect the river's Lake St. Francis, at Cornwall, with Lake St. Louis, above Montreal, there is Quebec's big Beauharnois power canal, now feeding a 1½-million-horsepower hydroelectric plant. This canal is constantly being enlarged to produce more power, and eventually it is intended to have a lock alongside Beauharnois powerhouse to drop deep-draft shipping the 83 feet down to Lake St. Louis. At present Soulanges Canal carries 14-foot navigation along the north shore of the river at this point.

From Lake St. Louis to Montreal harbor, a seaway replacement for the present Lachine Canal will be constructed. This, together with deepening from 25 to 27 feet of the Welland Canal between Lake Ontario and Lake Erie, will complete Canada's major portions of the seaway. Beyond the Welland Canal, in the Great Lakes and their connecting bodies of water, the problem is one of channel and harbor deepening—not of further canal construction. (See also CITY PLANNING.)

Ohio River Development.—The Ohio River, from Pittsburgh to Cairo, is 981 miles of artificially developed 9-foot waterway. As a completely canalized river it carries more commerce than the famed Panama Canal. Proponents of further development of the river are strongly advocating a greater year-round navigable depth. The 46 existing locks and dams date back at least to 1929, when the present system was completed. Several of these have been called dangerously in

need of replacement, and planned replacements would improve the river to a minimum depth of 12 feet. During 1955, work began on replacement of three outmoded and deteriorating Ohio River dams near Wellesville, Ohio. All three are to be replaced by a single \$50 million project known as New Cumberland locks and dams.

The entire Ohio River improvement project has been envisioned as a 10- to 20-year undertaking, depending on how readily federal funds are forthcoming. The situation was further complicated by a fight which was brewing over whether the fully canalized river should remain toll-free.

Tributaries of the Ohio River account for another 1,000 miles of navigable inland waterways. On the Cumberland River, Old Hickory and Cheatham locks and dams were both near completion in 1955, having cost, respectively, \$50 million and \$32 million. On the canalized Tennessee River, according to announcement by the Tennessee Valley Authority late in 1955, Wilson Dam will have a new lock with a 100-foot lift—highest in the world. Its 110-foot wide, 600-foot long chamber would handle in 50 minutes tows now taking 5¼ hours to pass through three existing, obsolete locks at the dam.

Calumet-Sag Channel.—This connecting link between Lake Michigan and the Illinois inland waterway system is slated for a \$188 million widening project, involving the lengthening and raising of many bridges that cross it. The first contracts for widening three miles of the 16.2 mile channel were awarded late in 1955. The present width of 60 feet will be increased to 225 feet. The entire project is expected to take six years to complete.

Panama Canal.—This great canal (see PANAMA CANAL) figured in the news in 1955 as its overhanging Contractor's Hill was cut back with great care to erase a threat of landslide that had endangered shipping. A crack in the high hill alongside the 41-year-old canal had been under observation since 1938. By 1954 this crack had grown to be 600 feet deep, and a slide threatened at this, the narrowest spot in the canal. Solution to the serious problem, achieved during 1955, involved shaving away the hillside into a series of benches sloped back from the shoreline. Also involved was a 5- by 7-foot tunnel into the hill at near canal level to drain out any water which might have entered the crack and caused dangerous pressures.

German Canals.—West Germany has presented a plan for widening and deepening its vital waterway network, which handles about one third of its total traffic. Work was already under way in 1955 on some of the projects involved. The Main River Canal and the Danube canalization

Bulldozers clear ground for new St. Lawrence Seaway canal, alongside present canal, near Iroquois, Ont.

MALAK, OTTAWA

are to be completed in preparation for final connection with the Rhine River. Also the Neckar Canal will be completed to the Stuttgart area as part of an eventual second linking of the Danube and Rhine rivers.

ARTHUR J. FOX, JR.,
Associate Editor, "Engineering News-Record."

CANARY ISLANDS. A group of mountainous islands in the Atlantic off the northwest coast of Africa, comprising two Spanish provinces—Las Palmas and Santa Cruz de Tenerife. Area, 2,807 square miles; pop. (1952), 809,952. The seaport cities of Las Palmas (158,313) and Santa Cruz de Tenerife (104,669) are the provincial capitals. Agriculture, fishing, oil refining, and bunkering are the main industries. Tomatoes and bananas are exported. An interisland air transport service by Iberia Airlines was authorized by the Spanish government in 1955.

CANCER. Public and governmental support of cancer work has continued unabated during 1955. A total of more than \$24,000,000 was contributed to the American Cancer Society during 1955, and the National Institutes of Health has received an appropriation of \$24,828,000 from Congress for the fiscal year 1956. A portion of these funds, in addition to private support, has made available a total of more than \$25,000,000 for cancer research during 1955.*

The controversy over krebiozen, a secret remedy for cancer, has erupted in the publication of two books. *Krebiozen—Key to Cancer?* written by Herbert Bailey, is a superficial defense of a disturbing episode in American science. A restrained and carefully documented book, entitled *Krebiozen—the Great Cancer Mystery*, by Dr. George D. Stoddard, served as a reply.

The association between cigarette smoking and lung cancer in man is reaffirmed by the continuing study by the American Cancer Society on 188,000 men between the ages of 50 and 70. Smokers have about seven times the lung cancer death rate of men who never smoked, and two-pack-a-day smokers have ninety times the lung cancer death rate of nonsmokers. Ex-smokers show a decreased death rate from lung cancer, as compared with those who continue smoking. Wynder, Bross, and Day have evidence that the consumption of more than six ounces of whiskey daily in association with tobacco smoking was correlated with an increased incidence of carcinoma of the larynx. The inferences concerning the carcinogenic effects of tobacco are not universally accepted, and numerous research projects to clarify the situation have been initiated, in part by the Tobacco Industry Research Committee.

Cancer Research.—There is increasing interest in the production of various types of transplantable human cancers which can grow regularly and by repeated transfer in cortisone- and X-ray-treated rats and hamsters. Some of these tumors also grow regularly in the untreated chick embryo and chicken. Ascites tumors are being more widely used in cancer research. Ascites tumors as isolated cells grow on intraperitoneal injection, and they produce a much more uniform tumor preparation for experimental use. Many transplantable solid tumors have been converted into an ascitic form.

* Information provided by the National Health Education Committee, Inc.

NORTH AMERICAN AVIATION, INC.

Artist's sketch of first atomic energy reactor designed for medical research and therapy. Gamma rays and neutrons, produced through atomic fission within the reactor, can be used directly in treating cancer patients.

No satisfactory serological tests for cancer have been described, but there is considerable interest in enzymes, associated with carbohydrate metabolism, which increase in concentration in the blood of some cancer patients; these enzymes include aldolase, lactic acid dehydrogenase, and phosphohexose isomerase. There has been no important advance in the search for chemicals which will inhibit tumor growth in animals. A number of effective compounds, such as the folic acid antagonists, 6-mercaptopurine, nitrogen mustard and related compounds, and azaserine are available, and combinations of these agents—together and with other drugs—are being studied with the object of enhancing therapeutic activity.

Clinical Results.—It is estimated that in the United States almost 500,000 cases of cancer were diagnosed, and 250,000 people died from cancer during 1955. Improvement in surgery and radiotherapy and earlier diagnosis are steadily increasing the number of patients with arrested cancer. Several new types of irradiation equipment are in use. High-energy sources, such as the betatron and electron beam, are used to treat deep-seated tumors. In the treatment of brain tumors, the neutron beam is being investigated in combination with administration of sodium borate to the patient, since boron will enhance the local effects of the neutron beam. Tumors are also being attacked by the local implantation of wires containing radioactive tantalum or iridium.

Two new compounds with actions similar to nitrogen mustard have been developed; they are p-carboxypropylphenyl bis (β chloroethyl) amine (CB1348) and triethylenethiophosphoramide (ThioTEPA). These drugs are used in Hodgkin's disease, chronic leukemia, and various types of cancer. Myleran has become an established agent in the treatment of chronic myelocytic leukemia. Two purine analogues, 6-thioguanine and 6-

chloropurine, have joined 6-mercaptopurine in the treatment of acute leukemia and chronic myelocytic leukemia. Azaserine, an antimetabolite of weak therapeutic activity, appears to enhance the beneficial effects of 6-mercaptopurine in leukemia in children. A number of new steroids with adrenocortical activity are now available. The most promising are prednisone (Meticorten) and prednisolone (Meticortelone). The drugs are more active by weight and cause less fluid retention than cortisone. They are useful in acute and chronic lymphatic leukemia, in breast cancer, and are widely prescribed as supportive agents.

The removal of the adrenal glands or the hypophysis is becoming recognized procedure in far-advanced breast cancer; it is estimated that almost 50 per cent of patients with disseminated breast cancer will respond to one of these operations.

Memorial Center for Cancer and Allied Diseases, New York City.

CANDY. See CONFECTIONERY.

CANNING INDUSTRY. Cold Sterilization.—Considerable attention was given in 1955 to the sterilization of foods by the use of ionizing radiations. The U.S. Atomic Energy Commission, stressing this possible use of radioactive waste from atomic fission, has launched a number of projects related to its application; and the Quartermaster Food and Container Institute for the armed forces has also made a considerable study along these lines. In addition to acting as an observer of these projects, the National Cannery Association has similarly studied the possibility of using ionizing radiations to destroy spoilage-causing bacteria and their spores, with particular emphasis on *Clostridium botulinum*, producer of a deadly toxin. So zealous in the past has been the NCA's concern with this organism that no case of botulism has resulted from commercially canned foods for about three decades, although such cases are reported yearly from home-canned foods.

Ionizing radiations are effective in killing bacteria, but their ability to inactivate undesirable enzymes, present in all foods and easily inactivated by heat, is less pronounced. In addition, ionizing radiations produce off-flavors and destroy certain vitamins. (See also *FOOD RESEARCH*.)

Effects of Atomic Blasts and Fallout.—Technologists of the NCA, the Can Manufacturers Institute, the Glass Container Manufacturers Institute, and the American Meat Institute, in cooperation with the AEC and the Federal Civil Defense Administration, participated in experiments related to the 35-kiloton nuclear explosion at Yucca Flats, Nev., on May 5, 1955. In 15 localities, ranging from one fourth to 3 miles from the center of the explosion, 25,000 tin and glass containers were strewn on the desert floor or placed on shelves or in basements of test-area houses. Both single and cased containers were used, and a variety of foods was selected to represent a wide pattern of consumption. These foods will be tested in animal feeding experiments, to be made over a probable two-year period, by the Federal Food and Drug Administration. The AEC and the FCDA must verify all reports and claims resulting from these tests.

Pure Food and Drug Act.—The 1956 convention

of the NCA will observe the semicentennial of the Pure Food and Drug Act of 1906. The organization of the NCA a year later pointed toward the canning industry's understanding of, and compliance with, the act's provisions.

U.S. Consumption and Production.—Preliminary figures indicate that per capita civilian consumption (in pounds) of canned goods in the United States in 1954 was as follows: vegetables, 35.9; fruits, 19.2; juices, 18.4; soups, 11.2; meats, 9.6; fish, 4.4; and baby foods (estimated on the basis of the total population), 4.0. In 1952 each child under 3 years of age consumed 52 pounds of canned baby food.

Data relating to the United States output of canned fruits and vegetables in 1953 and 1954 are shown in the accompanying table.

UNITED STATES PRODUCTION OF CANNED
FRUITS AND VEGETABLES

Product	1953 (number of cases)	1954
FRUITS AND FRUIT JUICES:		
Apple juice.....	3,080,844	4,219,890
Apples (6 #10 cans).....	2,941,823	4,709,392

CAPE VERDE ISLANDS. See PORTUGUESE TERRITORIES.

CARIBBEAN COMMISSION. This international body (constituted in 1946, when it superseded the earlier Anglo-American Caribbean Commission and was enlarged to include France and the Netherlands) is concerned in an advisory role

with matters of common interest to 4 member governments and the associated local governments of 14 Caribbean countries, with an aggregate population exceeding 6 million.*

The commission's activities are currently concentrated on agricultural and industrial development, housing, and community education, in which fields experts, loaned by the U.S. International Cooperation Administration and by the U.N. Food and Agriculture Organization, participated in 1955. The West Indian Conference, an auxiliary body of the commission, meets biennially to advise the commission on regional economic and social problems. The sixth such conference, dealing with education and small-scale farming, was held at San Juan, Puerto Rico, May 10-19, 1955. In view of the increasing political and economic autonomy of the area, the conference recorded its firm conviction that a revision of the agreement establishing the commission is urgently needed.

CARNEGIE, Dale, American lecturer and author: b. Maryville, Mo., Nov. 24, 1888; d. Forest Hills, Queens, N.Y., Nov. 1, 1955. The author of *How to Win Friends and Influence People*, he was widely known for his optimistic precepts for successful living.

Educated at the Warrensburg (Mo.) State Teachers College (1904-08), Carnegie went in 1911 to New York City where, after a false start as an actor, he began his career as a teacher of public speaking with the Young Men's Christian Association in 1912. Not long afterward he established his own office to capitalize on his discovery that the modern American's intense desire for success was a valuable commodity.

In 1919, he became business manager for Lowell Thomas, who was about to embark on a lecture tour of Great Britain. After several subsequent years of lecturing and traveling in Europe, Africa, and the Arctic, he returned to New York to resume his teaching. His first book, *Public Speaking; a Practical Course for Business Men* (1926; published in 1932 as *Public Speaking and Influencing Men in Business*), was successful and became the standard text for his courses. Subsequently he increased his audience through a column syndicated in 71 newspapers and through radio programs (inaugurated in 1933), in which his formulas for success were broadened to include the whole scope of human relations. To unify his varied activities he established the Carnegie Institute for Effective Speech and Human Relations, which in 1955 was conducting classes in 750 cities in the United States and 15 foreign countries.

Carnegie's most famous book, *How to Win Friends and Influence People*, was published in 1937. Permeated by an easy optimism which appeals simultaneously to the desire for fulfillment and escape ("Believe that you will succeed, and you will."), it has in recent times, according to his publisher, ranked second to the Bible in nonfiction sales, having been translated into 29 languages and having sold 4,800,000 copies.

Other Carnegie works, all related to the theme of success, include *Lincoln the Unknown* (1932); *Little Known Facts About Well Known People* (1934); *Five Minute Biographies* (1937); and *How to Stop Worrying and Start Living* (1948).

* Member governments (and their contributions to the total assessment budget of \$343,275 for 1955) are: United States (\$131,817), United Kingdom (\$117,743), France (\$54,924), and the Netherlands (\$38,790). Each member nation appoints 4 commissioners. The secretariat is at Port of Spain, Trinidad. The secretary general is E. F. H. de Vriendt.

CARROTS. See **VEGETABLES.**

CARTOGRAPHY. The technical and professional scope of cartographic practices was broadened further in 1955. The solution of pertinent problems involving ethics, professional recognition and registration, qualifications, and classifications of surveying and mapping personnel received special attention.

Domestic Mapping.—The topographic mapping program in the United States reached a new level with over 1,600 new quadrangles being published by the Geological Survey (q.v.). Nearly 2½ million copies of quadrangles were distributed in 1955. Approximately 40,000 square miles of geologic mapping was completed.

The Coast and Geodetic Survey (q.v.) made full use of new aerial photography in compiling and revising large-scale maps of coastal areas in support of nautical and aeronautical charting programs. The Mississippi River Commission was active in mapping the alluvial valley of the Mississippi River. Mapping in the Tennessee River watershed was continued. The Soil Conservation Service published soil maps for over 2,600 soil conservation districts and provided essential cartographic assistance for watershed protection, flood prevention, irrigation, and drainage work. (See also **SOIL CONSERVATION.**)

New Accomplishments.—The American Geographical Society has made substantial progress in developing an *Atlas of Diseases* which is a graphical portrayal of the relationship between some 25 diseases and the geography of the earth.

Higher than a two-story building, the world's largest map globe was dedicated in June 1955 on the campus of the Babson Institute of Business Administration, Wellesley, Mass. The giant globe is faced on a great steel ball, 28 feet in diameter, and shows the earth at 24 miles to the inch.

After 7 years of intensive work, a monumental *Sky Atlas* was completed during the latter part of 1955. The 1,758-plate atlas of the universe contains the results of the National Geographic Society—Palomar Observatory Sky Survey. (See also **NATIONAL GEOGRAPHIC SOCIETY.**)

In October 1955 the first volume (covering northern Europe) of the *Times Atlas of the World* was published. Actually this is Volume 3 of a five-volume set, the remaining four volumes to be published one each year until 1959. The work is being edited by John Bartholomew, head of a long-established map-making firm in Edinburgh, for the London *Times*, and is reported to contain some 200,000 place names on 120 new maps reproduced in from five to eight colors.

World Mapping.—The Army Map Service closed the final link in one of the longest measurable arcs of meridian in central Africa along the 30th meridian. Simultaneous adjustment of the entire arc is basic to future mapping throughout Africa.

At the Seventh Consultation on Cartography of the Pan American Institute of Geography and History, held in Mexico City in the summer of 1955, important resolutions were adopted for close coordination and extension of national mapping programs in the Americas.

The United Nations sponsored the first regional cartographic conference for Asia, held in India in February 1955, pursuant to a resolution of the U.N. Economic and Social Council. Regional technical problems having worldwide implications were discussed.

Nautical Charting.—Source material for charting has increased enormously since World War II

due to electronic developments in surveying. This new aid has also necessitated extensive modification of charting techniques and chart format.

The Hydrographic Office has introduced a new method of multitone relief shading in one press run, giving the same effect as multiple color printings. Achievement of a wide range of color values from one printing plate has increased the effectiveness of cartographic presentation.

The Lake Survey revised a substantial number of the Great Lakes charts during 1955 to reflect constantly changing conditions in the harbors and other critical waters.

Aeronautical Charts.—The Coast and Geodetic Survey published a new series of 9 route charts covering the main air routes of the United States. An aircraft position chart was published to afford coverage of the air routes from the Pacific Northwest to the Orient.

The U.S. Air Force charting program carried out by the Aeronautical Chart and Information Center was concentrated on target charts, mosaics, and charts for low-level, high-speed air navigation. The initial series of 44 jet navigation charts covering the Northern Hemisphere was nearing completion at the end of the year. Coverage of the Southern Hemisphere by this series is being planned.

The program of indexing the tremendous holdings of aerial photography on the U.S. Air Force common indexing system, contributing greatly to a better mapped world, was accelerated during the year. The unique indexing system devised by the U.S. Air Force insures maximum utilization of available photography.

New Techniques.—Long and tedious hours of hand-shading around or within a given map outline has been eliminated by a new mechanical method of producing a vignette tone around an irregular line. Revisions on acetate drawings are simplified through use of a special transfer ink.

The U.S. Air Force is developing a video mapping plate consisting of a film negative mounted on a round glass disk. The disk is designed to cover a 200-mile radius, and will be integrated with ground-based radar equipment used for spotting and tracking aircraft.

The Army Map Service has adopted a mechanical system of names placement called Nomafot which drastically reduces time and expense of an important phase of map preparation. The inking mechanism of printing presses has been modified to improve the process of printing on vinyl plastic material used in the production of plastic relief models. (See also ARCTIC EXPLORATION.)

ALBERT A. STANLEY,
Special Assistant to the Director, U.S. Coast and Geodetic Survey.

CATHOLIC CHURCH. See RELIGION—*Catholicism*; ROMAN CATHOLIC CHURCH.

CAULIFLOWER. See VEGETABLES.

CELERY. See VEGETABLES.

CEMENT. The production of portland cement in the United States increased from 264,023,000 barrels (of 376 pounds) in 1953 to 271,277,000 barrels in 1954, while shipments advanced from 260,888,000 to 274,096,000 barrels according to records of the U.S. Bureau of Mines. Mills operated at 92% of capacity in 1954 (93% in 1953). Production through July 1955 reached 166,117,000 barrels, an increase of 12% over the same period of 1954. (See MINERAL PRODUCTION for output of major producing countries.)

CENSORSHIP. The problem of censorship at the source of information continued to claim the attention of news media throughout 1955. Dissatisfaction was expressed over the operation of Executive Order 10,501, which imposes restrictions on the release of certain types of information by government agencies.

Congressional Investigations.—A subcommittee of the Senate Committee on Constitutional Rights and a subcommittee of the House Committee on Government Operations were established during the year to investigate the problem of government information. The Senate subcommittee held hearings on Oct. 17, 1955, and the House subcommittee held its first session on Nov. 7, 1955.

The following areas of censorship, as indicated in *Editor and Publisher* (Sept. 24, 1955, p. 16), are under investigation by both subcommittees:

(1) Denial to the public of free access to information concerning government operations not classified for military purposes and not involving a personal privilege.

(2) Requiring registration of printing presses or duplicating equipment in which any member of any Communist front or action group has an interest.

(3) Licensing the export of technical information not classified for military purposes.

(4) Censorship of foreign political propaganda by means of post office and customs regulation.

Five categories of government restrictions were outlined for the Senate group by J. Russell Wiggins, chairman of the Freedom of Information Committee of the American Society of Newspaper Editors:

(1) The government has obstructed general discussion of public matters by withholding information.

(2) The government has resorted to prior restraint and censorship, particularly through the Federal Communications Commission's regulations on political broadcasting.

(3) The government has on occasion attempted to punish by contempt the publication of material hostile to it.

(4) The government has restricted access to materials through the registration requirement for printing equipment utilized by Communist organizations.

(5) The Post Office Department has interfered with the distribution of printed publications, and the Treasury Department has restricted entry of material at the borders.

A subcommittee of the Senate Committee on the Judiciary, under the chairmanship of Sen. Estes Kefauver, released a report in August 1955 on the subject of *Television and Juvenile Delinquency*, which recommended legislation providing for a presidential commission to investigate all media of mass communication and their effects on children.

Newspapers.—Few changes in censorship on the world news front were reported during 1955. According to the Inter-American Press Association, freedom of the press either does not exist or is severely limited in Bolivia, Colombia, the Dominican Republic, Paraguay, Peru, and Venezuela. Undoubtedly there are also constraints on the press through the control of paper and/or administrative pressures in Mexico, Costa Rica, Honduras, and Guatemala. In Ecuador the press law provides for imprisonment for up to 12 years for the publication of "slandorous, immoral or subversive matter." The situation in Argentina was still in a flux during 1955 following the ousting of Juan Perón, but expectations were that a wider freedom of the press would be established under the new government.

The following summary of the world situation was reported by the secretariat of the International Press Institute (Zurich):

(1) Examples of countries where press control was complete: the Soviet Union and its satellites, and Com-

CENSUS DATA, U.S.

munist China, Yugoslavia, Portugal, and Spain.

(2) Examples of countries where political criticism by the press was formally possible but where censorship operated: Egypt, Syria, and Colombia.

(3) Examples of countries where special press laws or other discriminatory legislation exposed editors to arrest and persecution: Union of South Africa, Iran, Pakistan, India, Iraq, and Lebanon.

(4) Examples of countries where unofficial methods discouraged press opposition: Turkey and Indonesia.

Newsstand Publications.—Considerable concern has been expressed in the past over the distribution of "comic" and "horror" publications. In several communities the public reacted by banning or burning the objectionable books and magazines. The Comics Magazine Association of America, Inc., was formed in 1954 to attempt to improve the content of this type of publication. Charles F. Murphy, a New York City magistrate, was named to administer a voluntary self-censorship code, signed by 26 publishers. Acceptable content is given a code seal of approval. (See also CRIME—*Crime Prevention*; MAGAZINE PUBLISHING.)

Motion Pictures.—The Illinois Supreme Court in 1955 upheld as constitutional a Chicago ordinance which requires a written permit from the commissioner of police before any motion picture can be shown in the city. The commissioner is authorized by the ordinance to refuse a permit to any motion picture which, in his opinion, is obscene or immoral. According to the court, censorship of motion pictures is permissible on grounds of "immorality" and "obscenity," because such terms as defined in the ordinance are sufficiently definite and because immorality and obscenity are sufficiently detrimental to the public welfare to meet federal constitutional standards. (*American Civil Liberties Union v. City of Chicago*, 3 Ill. 2d 334, 1954.)

After Gov. Fred Hall of Kansas had announced (April 7) that the Kansas Board of Review was to be abolished (June 30), the U.S. Supreme Court (October 24) struck down the very law under which the board had been operating. The repeal of the Kansas statute reduced to five the number of states with active full-time censor boards. (See also MOTION PICTURES.)

F. S. SIEBERT,

Director, School of Journalism and Communications, University of Illinois.

CENSUS DATA, U.S. Population.—During 1955 the population of the United States, including the armed forces overseas, passed the 165 million mark. In recent years the population has been increasing at an average of about 2.7 million each year.

Late in 1955 the Bureau of the Census published projections of the United States population, based on various assumed fertility and mortality rates. For 1960 the projections of the total population ranged from a low of 176.5 million to a high of 179.4 million. For 1975, the projections ranged from a low of 206.9 million to a high of 228.5 million.

There were more than 28 million children of elementary school age (5 to 13 years) and another 18-plus million children under 5 years of age in the population of the United States, according to estimates for July 1, 1955. These estimates represent an increase in the last 5 years of about 6 million in the number of children in the elementary school age group, and of more than 2 million in the preschool age group.

At the other end of the age scale, 65 years and over, the number exceeds 14 million, an increase of about 2 million since 1950.

The effect of the slowing-up in number of

births during the depression years of the 1930's is shown in the estimate of 15 million for the group 18 to 24 years of age, a decrease of about 1 million from 5 years ago. All other age groups showed increases.

TABLE 1—DISTRIBUTION OF U.S. POPULATION BY BROAD AGE GROUPS

Age (years)	Population, including armed forces overseas		Change, April 1950 to July 1955	
	July 1955 (million)	April 1950 (million)	Number (million)	Per cent
All ages.....	165,248	151,132	+14,116	+9.3
Under 5.....	18,305	16,164	+2,141	+13.2
5 to 13.....	28,096	22,154	+5,942	+26.8
14 to 17.....	9,238	8,435	+803	+9.5
18 to 24.....	15,106	16,081	-976	-6.1
25 to 44.....	46,946	45,385	+1,561	+3.4

* Decrease. (Source: U.S. Bureau of the Census.)

issippi, Oklahoma, Vermont, and West Virginia—showed losses. Greatest numerical gains were shown for California, New York, Ohio, Michigan, Pennsylvania, and Texas.

Of the total civilian population of continental United States, estimated at 161.5 million in April 1955, those living in territory classified as urban numbered 103.5 million, whereas those living in rural territory numbered 58.0 million. The increases of 7.6 million in the urban and 4.3 million in the rural civilian population over the 5-year period were each at the rate of 7.9%.

The population living on farms in the United States numbered about 22,158,000 in April 1955. This figure is not significantly different from the corresponding estimate for 1954, but represents a drop of approximately 3,000,000 from 1950, when an estimated 25,058,000 were living on farms. The drop in farm population represents a continuation of the longtime downward trend, which has reduced the number of farm residents to 13.5% of the total population by 1955. Changes have been particularly marked since the beginning of World War II. Between 1940 and 1945, the number of persons living on farms decreased by over 5 million. Some return to farms occurred following the end of the war. After 1948, the downward trend was resumed; and, since 1950, farm population has decreased about 600,000 persons per year on the average.

Households.—There were an estimated 47.8 million households in the United States in April 1955. This was an increase of 4.2 million, or about 850,000 a year, since 1950. In 1955, there were about 42.2 million urban and rural nonfarm households and 5.5 million farm households, as compared with 37.3 million nonfarm and 6.3 million farm households five years earlier. Thus the increase for the five-year period was entirely in nonfarm areas. Farm households in the United States have been decreasing in number at an average annual rate of about 150,000 during the last five years. Nonfarm households have been increasing at a rate of about 1,000,000 yearly during the same period. The number of married couples living "doubled up" in households with others reached a postwar low of about 1.3 million, while in 1950 about 2.0 million and in 1947 about 2.9 million did not maintain their own households.

A survey covering the second quarter of 1955 revealed that available vacant dwelling units amounted to 2.3% of the nation's housing, compared with a rate of 1.6% in April 1950. Another survey revealed that about 32 million, or two thirds, of the country's 48 million households had television sets, compared with one in eight in 1950 when about 5 million had television sets.

School Enrollment.—Enrollment in schools at the beginning of the 1954-55 school year was at a record high of 36.1 million, according to a survey made in October 1954. Elementary school enrollment (first 8 grades) was 24.4 million, high school enrollment (grades 9 to 12) was 7.7 million, and college enrollment was 2.4 million. In addition, about 1.5 million children were enrolled in kindergarten.

Thirty million persons were enrolled in public schools below the college level, and 4 million were enrolled in private schools, including parochial schools. Growth in private elementary and high school enrollment has taken place twice as fast, percentagewise, as in similar levels of public schools since 1948, the first year for which such census data are available. During these six years the number of public school pupils increased by

4.8 million, or 20%, whereas the number of private school pupils increased by 1.2 million, or 49%.

The October 1954 survey showed a total of 856,000 persons 14 to 34 years old enrolled in "special" schools providing instruction in trade or business, outside the regular school system.

Labor Force, Employment, and Unemployment.—In August 1955 the civilian labor force had reached a record high of 67.7 million, and total civilian employment was at a peak of 65.5 million. At the same time, the total of 2.2 million unemployed was the lowest since the fall of 1953. In July a new peak of employment for women was reached with 20.2 million.

The latest available annual data (1954) show that total civilian employment averaged 61.2 million, about 1 million under the all-time high level of 1953. By the end of 1954, however, employment was back to the level of a year earlier, and the upward trend was continuing in 1955.

Unemployment averaged 3.2 million, or 5% of the civilian labor force, in 1954—about double the record postwar low of 1953. At its 1954 peak of 3.7 million, unemployment never approached the postwar high of 4.7 million in 1950, and there was a definite improvement during the latter part of 1954 and throughout the first three quarters of 1955.

Income.—The median income of individual Americans with money income in 1954 was \$2,300, about the same as in 1953, according to a survey made in April 1955, providing estimates for all persons 14 years old and over who received any money income during 1954. The median income of men was estimated at \$3,200 a year for both 1953 and 1954, after having risen steadily since 1945 when the estimated figure was a little over \$1,800. The median for women in 1954 was \$1,200, as compared with \$900 in 1945. The median income of families in 1954 was about \$4,200.

Manufacturing.—The growth of manufacturing industries in the United States since World War II has been steady. Based on *Annual Survey of Manufactures* data, total value added by manufacture has increased from \$74.4 billion in 1947 to \$121.7 billion in 1953, while total manufacturing employment has increased from 14.3 million in 1947 to 17.1 million in 1953.

Public Expenditures.—Public expenditure in the United States was at the same level in 1954 (\$110 billion) as in the preceding year. A decrease of 4% in federal government expenditure, resulting from a drop in national defense spending, almost exactly counterbalanced an 11% rise in state and local government spending. National defense expenditure dropped from \$50.5 billion in 1953 to \$46.8 billion in 1954. Nondefense spending—federal, state, and local—rose from \$59.4 billion in 1953 to \$63.7 billion in 1954. The federal government's direct expenditure for purposes other than national defense was \$27.1 billion in 1954; state and local governments spent \$36.6 billion. In per capita terms, total 1954 expenditure of all governments was \$680, with national defense accounting for \$288 per capita, and all other public functions, for \$392 per capita.

Retail Sales.—Retail sales during 1954 reached a figure of about \$170,674,000,000, slightly under 1953, but for the first nine months of 1955 had reached a record high figure of about \$134,477,000,000 (preliminary), compared with \$123,604,000,000 for the like period in 1954.

Foreign Trade.—Imports for consumption to-

taled \$10,234,500,000 in 1954 and \$6,363,600,000 in the first half of 1955. Domestic exports totaled \$14,966,400,000 in 1954 and \$8,822,600,000 in the first half of 1955.

Publications.—In addition to the compilation of the data summarized above, the Bureau of the Census published a number of studies based on 1950 Census of Population data. The 1955 edition of the *Statistical Abstract of the United States*, and the biennial publication, *County Business Patterns 1953*, also were published.

ROBERT W. BURGESS,
Director, Bureau of the Census.

CENTRAL AFRICAN FEDERATION. See RHODESIA AND NYASALAND, FEDERATION OF.

CENTRAL AMERICA. The southern end of North America, from the Isthmus of Tehuantepec (Mexico) to the Isthmus of Panama. The term Central American States usually denotes the five republics of Costa Rica, Guatemala, Honduras, Nicaragua, and El Salvador, but may also include British Honduras, Panama, and the Canal Zone (qq.v.). (See also INTER-AMERICAN AFFAIRS.)

CERAMICS. In 1955 ceramic production experienced a gratifying increase above that of the previous three years, and indications were that the rise would continue during 1956. The increase was largely due to new construction, remodeling, and suburban development.

Structural Ceramics and Allied Groups.—In these groups the increase in the production of building brick is typical of the entire field. The monthly production of 500 million standard units is considered good, but brick production was well above 600 million units during the first half of 1955 and was expected to continue as such for the remainder of the year. Lightweight aggregates from clay and shale, as well as sewer pipe, drain tile, floor and wall tile, and refractories (which are directly affected by steel construction) all showed similar increases. Foreign imports prevented even greater increases.

Whitewares.—Sanitary ware, tiling, and electrical porcelains were in increased production because of construction trends—remodeling in particular being responsible. However, dinnerware and hotelware production, which had declined through the period of 1952 to 1954, remained at the 1954 level through 1955. This was the only major group not showing increases, and prospects for 1956 were not good. Heavy imports, the competition of plastics, and labor costs accounted for the losses.

Enameled Wares.—Utensil production continued at the 1954 level. The production of enamels for construction, for the appliance trade, and for air conditioners, however, showed a sizable increase.

Craftwares.—In 1955, as in 1953 and 1954, business continued to be good, but there was no decided increase. Imports continued to remain an inhibiting factor.

Glasswares.—Imports also caused a decline in the production of tableware, a minor part of the glass trade. The production of flat glass, plate glass, structural glass, and glass fibers, however, showed a steady upward swing in 1955 because of high construction levels and increased automobile production. In 1955 the output of glass containers remained about the same as that of 1954.

In all departments of the ceramic industry, greater stress was being laid on the use of automation processes to reduce costs. No radical or

basic changes in raw materials or formulas were noted. Considerable experimenting and great interest were current in such specialized fields as superrefractories, electronic devices, and cermets (heat-resistant ceramic-metal combinations). New or hitherto unused raw materials, synthetics, and processes were being tried in these fields. (See also CHEMISTRY.)

CEREAL GRAINS. See AGRICULTURE; GRAINS.

CEYLON. Lying directly south of India in the Indian Ocean, the island of Ceylon is a sovereign state of the British Commonwealth, with dominion status. Its area, with outlying islands, is 25,332 square miles; the population totaled 8,103,648 in March 1953. Two thirds of the Ceylonese are Sinhalese; about one eighth are Tamils. Most Sinhalese are Buddhists, and the Tamils are Hindus. Colombo (pop., 424,816) is the capital and chief port.

Government.—Parliament is composed of a 30-member Senate (15 nominated and 15 elected) and a House of Representatives (6 nominated and 95 elected), which chooses the 15 elected members of the Senate. The government coalition is headed by the United National Party. Sir Oliver Goonetilleke became governor general on July 17, 1954, succeeding Viscount Soulbury. The prime minister is Sir John Kotelawala (assumed office Oct. 12, 1953). Colonel Anton Muttukumara (appointed Jan. 31, 1955) heads the Ceylon Army.

Education.—There were 6,894 government and assisted schools, with an aggregate enrollment of 1,625,742 pupils in May 1954; in 1953-54 expenditure on government education was Rs.135,247,055 (the Ceylon rupee equals approximately 21 U.S. cents). The University of Ceylon, established in 1942, has faculties of Oriental studies, art, science, medicine, law, agriculture, engineering, and veterinary science. Under the Ministry of Education a special department was established in 1955 for translating all secondary school textbooks into Sinhalese and Tamil, and to create a technical vocabulary in those languages.

Finance and Economic Development.—Estimated revenue in 1954-55 was Rs.1,065,151,402; expenditures, Rs.815,807,303. The budget for 1955-56 estimated total revenue at Rs.1,052,859,941, and expenditures at Rs.946,306,483.

A second 6-year program of government investment envisages a total expenditure during 1954-60 of Rs.2,529 million, out of which Rs.1,942 million (representing 76.79% of the total cost) will be spent on economic projects, and Rs.403 million (16%) on social services. Of the allocations to economic projects, public utilities account for 33.1%, and agriculture, irrigation, and fisheries for 36.5%. Development work was to include improvements of the ports of Galle, Kankasanturai, and Trincomalee; completion in 1956-57 of the bridge over the Kelani Ganga River; construction of a new power station in Jaffna; expansion of the Ratmalana airport; completion in 1957-58 of stage 2A of the Laxapana hydroelectric project, and the starting of five major projects to provide irrigation for over 120,000 acres and to settle 140,000 families on irrigated land or on crown land to be assigned to commercial crop production.

Production.—Of 3.25 million acres under cultivation in 1954, about two thirds were utilized by three basic crops: coconuts (920,000 acres), rubber (659,000), and tea (575,000). In addition rice was cultivated on 1,270,000 acres, yielding 31.5 million bushels.

Industrial production included cigarettes, cigars, soap, textiles, plywood, cement, acetic acid, leather, ceramics, and coir goods. Development plans in 1955 included the construction of plants for the manufacture of paper, vegetable oil, and caustic soda, for sugar refining, and for the exploitation of ilmenite sands.

Under the government investment program, Rs.105 million is to be devoted to the rehabilitation of the rubber industry; Rs.15 million to development of coconut production; and Rs.4 million to assistance to tea-producing small holders. Following completion of the dam and irriga-

tion projects in the Gal Oya Valley, more than 200,000 acres of jungle land were being brought under cultivation in 1955.

Foreign Trade.—During 1954, Ceylon exported 920,498 hundredweight of copra, and 122,318 of coconut oil. Rubber exports amounted to 209,138,815 pounds, valued at Rs.285,282,007, and tea exports aggregated 361,262,330 pounds, valued at Rs.1,122,798,116. The value of exports in 1954 (principally tea, rubber, and coconut products) was Rs.1,714,675,651, compared with Rs.1,485,535,579 in 1953. Principal buyers were the United Kingdom (Rs.495 million), Australia (Rs.172 million), Communist China (Rs.222 million), and the United States (Rs.117 million). Imports in 1954 (chiefly foodstuffs and textiles) amounted to Rs.1,397,255,629, compared with Rs.1,607,837,636 in 1953; principal sources were the United Kingdom (Rs.293 million), Australia (Rs.106 million), India (Rs.191 million), Burma (Rs.125 million), and Communist China (Rs.158 million). There was a favorable trade balance of Rs.412 million at the end of 1954, as compared with an adverse balance of Rs.39 million in 1953.

Communications.—In 1955, Ceylon had 17,500 miles of highways and 896 miles of state-owned railways. Airlines operating through Ceylon are Air India, British Overseas Airways, Qantas Empire Airways, Trans-World Airlines, and KLM Royal Dutch Airlines. A daily service is operated by Air Ceylon to Trichinopoly in South India, via Kankasanturai, northernmost point in Ceylon.

Principal Events, 1955.—Sir John Kotelawala represented Ceylon at the conference of prime ministers of the Commonwealth countries held in London, Jan. 31–Feb. 8, 1955, and at the Asian-African Conference (q.v.), where his speech of April 21, strongly attacking "Soviet colonialism," won international attention. Supporting the initiative of the United States government in proposals for achieving an Arab-Israeli settlement in the Middle East, Sir John tendered the services of his government in this connection on August 7.

Harold E. Stassen, then director of the U.S. Foreign Operations Administration, arrived in Colombo on March 3, 1955, where he was received by the governor general and also had talks with the prime minister and other members of the cabinet. (Ceylon has been barred from receiving United States economic aid because of her exports of rubber to Communist countries.) Other visitors during 1955 included the prime minister of Australia, R. G. Menzies (January 18–25), and Field Marshal Pibul Songgram, prime minister of Thailand (June 17).

In February 1955, Dr. Frank Godwin, a technical specialist of the International Bank for Reconstruction and Development, arrived at Colombo to help establish and become first director of the Ceylon Institute of Scientific and Industrial Research.

Teams of scientists representing Great Britain, the United States, Japan, Switzerland, India, and Germany were among those who on June 20 studied the total eclipse of the sun from various parts of the island (see also ASTRONOMY.)

On December 14, along with 15 other nations, Ceylon was elected to membership in the United Nations.

DONOVAN ROWSE,
Author and Publicist.

CHANNEL ISLANDS. This United Kingdom dependency, situated off the northwest coast of France, comprises Jersey, Guernsey, Alderney and Sark (dependencies of Guernsey), and

smaller islands, aggregating 48,083 acres with a population (1951 census) of 102,770 (Jersey, 55,288 in 1954; in 1953, Guernsey, 44,158; Alderney, 1,319; and Sark, 492). Chief towns are St. Helier in Jersey and St. Peter Port in Guernsey. The main islands have separate governments, each with a lieutenant governor (Jersey: Admiral Sir Gresham Nicholson, appointed Oct. 16, 1953; Guernsey: Air Marshal Sir Thomas W. Elmhirst, assumed office Oct. 16, 1953), a royal court of unpaid lay justices, and an elected Assembly of the States.

Revenue of Jersey in 1953–54 was £2,650,842; expenditure, £2,606,115; Guernsey's revenue totaled £1,948,105; expenditure, £1,939,964, in 1953. Primary and secondary education is provided. Trade is principally with the United Kingdom, to which flowers, fruit, vegetables, and cattle, valued at £14,706,762, were sent in 1954. Imports of fuel, foodstuffs, and timber were valued at £22,853,763. During an official visit in September 1955, the British home secretary, Gwilym Lloyd-George, inspected the Minquiers and Les Ecréhous island groups, sovereignty of which was awarded to Great Britain by the International Court at The Hague in 1953.

CHASE, Harry Woodburn, American educator: b. Groveland, Mass., April 11, 1883; d. Sarasota, Fla., April 20, 1955. A staunch advocate of academic freedom and of the liberal tradition in education, he was chancellor of New York University from 1933 until 1951.

Harry W. Chase was educated at Dartmouth College (B.A. 1904; M.A. 1908) and Clark University (Ph.D. 1910). On completing his graduate work, he was appointed to the faculty of the University of North Carolina, where he taught the philosophy of education and psychology and was named president of the university in 1919. During his 11-year administration he succeeded in developing the university into one of the most progressive educational institutions in the South. In 1930 he became president of the University of Illinois, a post he held until 1933. During these three years he was instrumental in reorganizing the administrative structure of the university and establishing the schools of Physical Welfare and of Fine and Applied Arts.

On July 1, 1933, Dr. Chase, succeeding Elmer Bosworth Brown, became the eighth chancellor of New York University. Under his energetic direction, the university established the New York University-Bellevue Hospital Medical Center, the Washington Square Law Center, and the Alumni Gymnasium on the University Heights campus. When he retired in July 1951, the university had become one of the largest in the United States.

CHEESE. See Index entry.

CHEMISTRY. Nuclear Chemistry.—The production of elements 99 and 100 by means of a cyclotron was announced in 1954. In 1955 the codiscoverers proposed the names einsteinium (symbol E) for element 99 and fermium (symbol Fm) for element 100, in honor of the two great nuclear scientists, the late Albert Einstein (q.v.) and the late Enrico Fermi. It was further revealed in 1955 that both elements were found in radioactive debris from tests made in the Pacific in 1952.

Seventeen atoms of element 101 (mass number, 256) have been produced and identified by bombardment of element 99 in a cyclotron at the University of California at Berkeley, and the

name mendelevium (symbol Mv) has been given the substance. Extremely radioactive, this heaviest of all known forms of matter has a half-life of between one-half hour and three hours, and decays by spontaneous fission.

The most radioactive piece of material for peacetime use is a 13-inch pipe, 2 inches in diameter, composed partly of radioactive cobalt. Its radioactive strength is estimated at 3,500 curies, while the corresponding value of the world's refined radium is about 2,400 curies. The pipe, which is to be used in petroleum research, remained in a "swimming pool" reactor for two and one-half years, and was transferred to its present location in a three-ton lead container.

Radioactive isotopes in rapidly increasing amounts are finding a still greater variety of uses in research and engineering applications. They serve to trace reaction paths, catalytic action, flow of fluids, position of materials, and distribution patterns. They measure chemical compositions, thickness, density, viscosity, extent of corrosion, and wearing rates. Other uses include catalyzing chemical reactions, sterilization without heat, radiography, elimination of static hazards, and production of luminescence. Instances are cited of savings of \$100 million annually through the industrial use of isotopes.

Radiological sterilization has made great progress in eliminating bacteria in packaged pharmaceuticals, and shows phenomenal promise in preventing deterioration of fresh foods for long periods of time. The foods are sealed, preceded in some cases by blanching or short heating, but often entirely in the cold state, and are subjected to highly penetrating radiations. Potatoes so treated, even when unsealed, do not sprout for as much as a year. (See also CANNING INDUSTRY; FOOD RESEARCH.)

Radiated polymers are free from the action of residual catalysts, and are of special value in preventing corrosion of metals imbedded in insulating plastics. Radiation also improves the properties of such polymers as polyethylene. Gamma rays and fast neutrons accelerate reactions, some of which are otherwise thermodynamically impossible. Tagged dirt permits the development of more efficient detergents. A very small amount of radioactive material, which makes possible the detection of differences in the conductivity of an ionized gas, is the basis of a fire alarm that warns of the presence of combustion products long before smoldering material bursts into flame.

Inorganic Chemicals.—The inert gas, argon, until 1894 an undiscovered component of air and hidden in nitrogen, is now separated by distillation of liquid air and employed to the extent of nearly one-half billion cubic feet per year. Its chief uses are in shielding the electric arcs in the welding of stainless steel, nickel, and the light metals, magnesium and aluminum.

Prospects are that in another 20 years Mexico will have become the world's major producer of native sulfur. Several plants with good port facilities are in operation. Probable and proved resources are now over 50 million tons. By 1956, yearly production from three plants will reach 1 million tons.

Chlorine trifluoride is being employed in perforating oil well tubes and casings as much as two miles below ground level. The chemical's container is positioned and fired by electricity, an igniting compound being injected into the fluoride chamber. Penetration is instant and complete without flare or burr in the pipe. Since the trifluoride reacts with silicon compounds, this

material may be used instead of diamond bits in drilling in very hard formations.

The original process for making the versatile chemical, hydrazine (NH_2NH_2), results in a 2% water solution. Hence water removal is a great problem. By ordinary distillation a constant-boiling mixture which still contains over 40% water is obtained. Addition of aniline and a series of distillations yield as much as 70% of the hydrazine free of water, and the remainder is recycled and recovered.

Metals.—The corrosion of steel has been divided into two types, the first being known as "protective corrosion," in which the rust forms a retarding coating with little more damage than discoloration, readily remedied by polishing, waxing, and touch-up painting. The second and much more serious type is "sheltered corrosion" which takes place in hidden and relatively inaccessible locations from which moisture cannot easily escape. Nonprotective rust continues to form in depth in the metal. Accelerated corrosion tests, which in 20 days duplicate the damage of three years of ocean-beach exposure, permit the selection of resistant over highly susceptible steels, and the development of new alloys with better properties.

The manufacture of stainless steel depends on chromium, which is introduced as ferrochromium. Carbon in such small amounts as 250 parts per million is rejected from the metal to grain boundaries, where corrosion takes place. The rejection is suppressed by annealing, but is set off by welding. Since 1922 it has been possible to reduce greatly an original 0.2% carbon content, and recently a high-temperature vacuum furnace brings the carbon down to less than 0.01%. The furnace is capable of removing carbon monoxide at the rate of 5 tons per hour.

A method of upgrading nonmagnetic iron ores has been developed in which coarsely ground taconite ores with only 30% iron content are suspended in a stream of hot reducing gas. The reduced ore is quenched with cracking of the particles so that further grinding is easy. Magnetic separation with grinding results in a product containing 63% iron. A high-silica waste is rejected, and the upgraded product is formed into pellets, which are sintered before going to the blast furnace.

A new copper-smelting process has recently completed its first year of full operation. Finely divided copper concentrate and flux pass with oxygen into a preheated smelting furnace. The products are a matte of copper and iron sulfide, a slag still rich in copper, and a gas containing up to 75% sulfur dioxide. The slag is showered with droplets of iron sulfide at the skimming end of the furnace, which serve to extract copper. Part of the sulfur dioxide is purified and sold as a liquid to paper industries, the remainder being made into sulfuric acid. The oxygen unit for this process produces 325 tons of a 95% gas per day. (See also METALLURGY.)

A modification of the process of zone-melting of metals to attain a very high degree of purity is to form the metal—titanium, for example—into a rectangular or ridged bar and to carry out the melting operation in an electrical coil producing high-frequency eddy currents in the bar. Impurities migrate to the unmelted edges, which form a cage confining the viscous melt. When the operation is complete and the bar is cooled, the edges containing the undesired substances are cut off. Melting is carried out in an inert atmosphere.

The first plant producing sodium on a large

scale, for reduction of titanium tetrachloride to the metal, is ready for operation. In order to produce sodium of 99.95% purity, the electrolytic cell is blanketed with argon. Either pure potassium or an alloy of sodium and potassium can be produced by passing molten potassium chloride down a tower packed with steel rings, while sodium vapors rise from a reboiler at the base of the tower. These metals are employed in organic syntheses and as heat-transfer media in nuclear reactors.

Ceramics.—Two very important fields in which ceramic materials are making great contributions are as coatings of metals to resist very high temperatures, and as electronic materials.

Metal coatings previously in use withstood temperatures of from 1400°F. to 2200°F., but research in jet and rocket propulsion requires 3000°F. and higher. Application of such a coating is accomplished by forming a high-melting oxide into a rod, which is baked and then fed through a metallizing gun in an oxygen-acetylene flame. Another technique for coating graphite with silicon carbide involves reacting the graphite with silica vapor to produce the carbide on the surface.

Cooperative efforts are now being made by industry and government to standardize the purity of barium titanate as an electronic material. Presently employed to the extent of 2.5 million pounds per year, this figure is expected to be doubled by 1960. Both source materials and fabricating processes are being examined and methods of tests perfected, resulting in a single set of standards. This material is employed in condensers for radio and television industries and also in piezoelectric elements of all types, underwater sound-detection instruments being typical.

Organic Chemicals.—After 20 years of research, nitroparaffins are now being produced on a large scale. Typical compounds are nitromethane, nitroethane, and both 1- and 2-nitropropanes. Something like 2,000 derivatives have been made from the nitroparaffins. Nitration is a vapor-phase operation. Applications of nitroparaffin derivatives include solvents, emulsifying, surface-active, reducing, and resin-curing agents, catalysts, and resin stabilizers.

Sorbic acid, an unsaturated straight-chain monobasic acid, was originally produced in quantity to upgrade drying oils during the period of tung oil shortage. It is now effectively used in inhibiting moulds in yeast and food products. The starting substance is hexadienal, a trimer made from acetaldehyde. It is nontoxic and may be used in a cheese wrap. It is metabolized in the body and has some slight food value.

Acrolein, a simple three-carbon unsaturated aldehyde, is now finding increasing applications. A century ago it was made by dehydrating glycerin, and is known to housewives as the substance produced when frying fats are overheated. In quantity it is not only irritating but toxic. It is now produced by the thermal cracking of diallyl ether to give propylene and acrolein. Propylene alone may be catalytically oxidized to acrolein. Acetaldehyde and formaldehyde condensation is a further source. Its derivatives include menthionine, folic acid, and formaldehyde-acrolein resins. Dialdehydes made from acrolein will cause cross-linking of hydroxy compounds, such as cotton and rayon, to improve shrink and crease resistance without loss of flexibility. The dialdehydes are also employed in increasing water resistance of paper. Hydrogenation of dialdehydes produces glycols, which are used in manufacturing isocya-

nate foams. Instead of glycerin as a source of acrolein, it is now proposed to make glycerin from acrolein and hydrogen peroxide.

The ethanolamines, mono-, di-, and tri-, are now being produced to the extent of 80 million pounds per year, and at the present rate of growth will soon reach the 100-million-pound figure. The relative positions of the three are continually shifting. The major function of monoethanolamine is the removal of hydrogen sulfide from natural and refinery gases. It is also a starting substance in detergent manufacture. Diethanolamine is decreasing as a gas absorbent, but holds an important position in the field of liquid and shampoo detergents, and in the textile industry. Triethanolamine finds its largest use in the making of toilet goods, and most of the remainder goes into textile specialties and into such miscellaneous fields as petroleum demulsification, rubber chemicals, and as an aid in the grinding of cement.

Colloids.—This field is essentially that of "surface chemistry" and includes emulsions, films, surface-active agents producing wetting and detergency, fine particles, adsorption, and ion-exchange reactions. Some of these materials might also be classified under other headings.

A commercial emulsifying agent is credited with protecting a city from a disastrous fire. Oil to a thickness of four inches had been spilled into a river flowing through the city. By damming the flow of oil with log barriers, and immediately applying the emulsifier, the oil layer was dispersed into the water and flowed harmlessly away in the river.

Cetyl alcohol, a solid substance sparingly soluble in water, has been used in Kenya, Africa, to reduce evaporation from reservoirs. The coating is of the value of one molecule thick, is harmless to humans and fish, and is helpful in mosquito control. Rainfall in Kenya is sporadic, and water exposed in shallow pans evaporates as much as 50% to 75% in a day.

Suds have been found to be objectionable in large-scale mechanical dishwashing machines, because the jet of hot water becomes retarded. Nonionic detergents of the alkyl-aryl ether type are said to reduce suds greatly. They are also good wetting agents for high wet-strength paper.

Silicones are being built into leather for shoe uppers during the tanning operation to produce permanent water resistance. Water is excluded under flexing conditions hundreds of times as long as is possible with ordinary chrome leather. Each fiber is surrounded by a water-repellent silicone film.

Colloidal silica particles less than one millionth of an inch in diameter in a liquid dispersion may be worked into the tiny crevices and interstices of rugs, upholstery, painted walls, and wallpaper. When the liquid evaporates, the fine particles remain and exclude dirt. Comparison of treated and untreated surfaces, dusted and subjected to the same extent of vacuum cleaning, shows marked differences in appearance, the untreated surfaces retaining appreciable amounts of soil. The same type of colloidal silica imparts slip resistance to emulsion-film waxes, and also serves as a stabilizer in foam-rubber production, and to give heat resistance to adhesive coatings and fibrous structures.

The action of zeolites is originally that of adsorption, which is commonly followed in commercial applications by ion exchange. A new use of alkali aluminum silicates is in gas purification, in which preferential adsorption is their sole

FIRESTONE NEWS SERVICE

X-ray patterns for natural rubber (above) and for Firestone's new synthetic polyisoprene rubber (below) show striking similarity, including crystalline reflections, which show up as bright spots in both pictures. The new synthetic rubber, which has been in pilot plant production, is expected to be particularly useful in large truck tires.

function. These materials, when dried, are made up of porous molecules with many microscopic cavities which function as sieves. Ethane is selectively adsorbed, while propane will not enter the pores of one type. Another will accept straight-chain hydrocarbons, while branched chains are not admitted. Selective adsorption of unsaturated hydrocarbons in preference to saturated has been reported. Polar molecules are picked up, while nonpolar molecules pass by. These zeolites have remarkably high ability to remove water from relatively dry gases. They are used in pellets in fixed beds and as a powder in fluidized beds, are easily reactivated by mild heating, and the captured materials may be recovered.

Plastics.—Isophthalic acid from metaxylene is produced to the extent of 50 million pounds per year. The location of the carboxyl groups in the 1:3 position permits the formation of resins of higher molecular weight and greater durability, which also have better drying times with high oil content. They are also quite heat stable and have good exposure records. Being without taste and odor, they may be used to line food containers.

New low-pressure processes for polyethylene are now in large-scale operation. One is described as operating at sufficient pressure to retain the low-boiling hydrocarbons in which the polymerization takes place at operating temperatures, and employing hexavalent chromium compounds as catalysts. The product of low-pressure polymerization is distinctly different from the polyethylene made at high pressures. It melts at about 255°

to 261°F., which permits steam sterilization. It is also more rigid and has high impact strength at low temperatures.

A plant for the large-scale production of polyester film, a product of polyethylene terephthalate, has been in operation since late in 1954. This material is already a well-known textile fiber. As a film it has extremely high tensile strength, as well as flexibility from -60°C. to 150°C. Metals may be deposited on the film by a vacuum process, and the laminate may be slit to form a metallized yarn. The polyester film may be spread on fabrics and leather, and may be embossed; it may also have grain effects painted on the underside and applied to plywood to give the effect of fine woods. In the chemical industry an important use is in lining containers to replace lacquer and tin plate.

A 15-story building has been weatherproofed by covering it with a plastic skin by spraying. Three or four treatments are said to be sufficient for the life of the building. Plastic films are also being employed in the construction industry as temporary walls in winter.

Artists' paints now contain a type of vinyl plastic which remains workable indefinitely on a metal or glass palette. Canvas is previously coated with a clear plastic film to prevent loss of plasticizer in the cloth. When the picture is complete, the plastic is set by gentle heat and may be rolled or folded without cracking. It is possible to apply several coats with baking after each application. (See also PLASTICS.)

Butadiene is the most important chemical in the synthetic rubber industry, but recently a liquid polybutadiene has entered the plastics field. Polymerization of butadiene in this case is carried on in a solvent with a sodium catalyst. Its principal uses are in protective coatings, in casting and laminating resins, and as a vulcanizing softener in the rubber industry. It has a molecular weight of 1300, and evidently cycloolefinic rings with conjugated unsaturation make it highly reactive. Heated in the absence of air to 500°F., it forms a highly cross-linked transparent resin.

Silicones are being applied to concrete soon after curing to prevent water from soaking into pavements, and also to halt chipping and cracking by alternate freezing and thawing. Pavements are not made slippery by this process. Another use of silicones is that of coating glass containers to increase strength and to cut down breakage loss. The surface is also lubricated so that impacts other than those at an angle of 90° become glancing blows.

Rubber.—Previous efforts to polymerize isoprene, the unit polymer of natural rubber, have been unsuccessful because the material had a random and unpredictable structure. A new rubber has been announced which is a cis-1,4 polyisoprene (all the methyl groups are on the same side of the hydrocarbon chain). Infrared and X-ray tests show this type of polyisoprene to be identical with natural rubber. The chief drawback of present tire rubbers is that they cannot be used in any quantity in large truck tires because of heat build-up. Both natural rubber and the new synthetic have only half the internal heat build-up of GR-S rubber. This is particularly important where trucks have to be run at high speeds under heavy loads in hot weather. The new rubber has been in pilot plant production for two years or more, and has been subjected to one half-million miles of truck tests. Present costs are slightly higher than GR-S rubber, but

are competitive with imported natural rubber. (See also RUBBER.)

Petroleum.—Although not generally regarded as a chemical-process industry, the annual production of crude oil, including exploration, drilling, lifting oil out of the ground, and transporting it to refinery and process plants, requires chemicals worth about \$1 billion. In 1953, United States production of crude oil amounted to 2.36 billion barrels from nearly 50,000 wells. At the end of 1954, nearly 3,000 drilling rigs were operating in the United States and Canada. Wells average over 4,000 feet in depth, and explosives required in their discovery cost over \$7 million. The unspectacular drilling muds constitute the largest chemical requirement. The operating of cooling and lubricating drilling bits, removing cuttings, preventing settling when circulation is stopped, and walling the hole require not only native earth minerals and water but also complex fluids containing special clays, heavy materials, colloids, and chemicals of various types. In order to obtain better yields, formations are subjected to acidizing with buffered acids and fracturing by injecting liquids of high viscosity under heavy pressure. Secondary recovery requires a variety of chemicals in the water which replaces oil. A number of other chemicals serve as solvents, scale and corrosion inhibitors, demulsifiers, gas dehydrators, and cleaning agents. Plastic pipe is also coming into greater use in petroleum production.

Most gasolines, except aviation fuels, are well below 100-octane number, but recently two processes have been developed by which 100-octane number gasoline is available at service stations. One process separates low-octane fractions from the catalyst zone and returns them until the desired value is reached. The other process involves catalytic reforming with conversion of 91% of naphtha feed stock to as high a 100-octane gasoline before addition of lead tetraethyl.

Pharmaceuticals.—Leading in sales value among the more recently developed pharmaceuticals are antibiotics, sales of which totaled \$266 million in 1954. Vitamin sales were of the order of \$76 million. The leading vitamins, in dollar value, were vitamin A, which is a required ingredient in margarine as well as a standard pharmaceutical; vitamin C (ascorbic acid), which is used only in human nutrition; and vitamin B₁₂ (pyridoxine). The last named is priced by the gram rather than by the pound, and is over 100 times as costly as gold. However, it is prescribed in very small quantities. Riboflavin (vitamin B₂) is an ingredient of animal and poultry foods to twice the extent of human consumption. The least expensive of all the vitamins is niacin, valued at \$3.56 per pound in 1954, whereas vitamin B₁₂, if priced by the pound, would cost around \$68,000. Fish-liver oils continue to be competitive with vitamin A.

An antibiotic added to water containing salts and a cellulose derivative to insure distribution, followed by freezing, produces blocked and flake ice in which fish caught off the shores of British Columbia are shipped to market in perfect condition. Any of the antibiotic absorbed by the fish is destroyed by cooking. The technique is also being applied to poultry.

Instead of conceding that natural hormones are superior to any derivatives or synthetics of similar physiological action, research has been actively stimulated on derivatives and partial synthesis from natural starting substances. Halogen derivatives of steroids are being made, and double bonds and hydrogen atoms for replace-

ment of hydroxyl groups are being introduced into the large molecules. Amino acids have been identified, and the entire structure of beta-ACTH has been revealed. A peptide chain of 39 amino acids has been recognized, and their sequence in the molecule is known. (See also BIOCHEMISTRY; CHEMOTHERAPY; DRUGS; VITAMINS.)

Textiles.—World production of six textile fibers remains at an annual level of over 24 billion pounds, but man-made fibers increased by 9% to about 4.9 billion pounds in 1954. At one time staple rayon yarn was of minor importance, but at present its production is decidedly larger than the filament type, the two together representing about 90% of all artificial fibers. Including glass fibers, artificial noncellulose fibers have a world output of 476 million pounds annually, of which about three fourths are made in the United States. World capacity for synthetic fiber production is expected to exceed 900 million pounds by 1956.

Closely woven tubes of nylon thread are being used as artificial arteries to substitute for autopsied human material. The nylon is braided on glass, given a formic acid dip, and crimped on the original mandrel to prevent kinking. Final treatment involves silicones. The fabric is unwettable, and blood forms an impervious lining in a few minutes with very little leakage. Work is being done with water-repellent acrylic fibers and with orlon for the same purpose.

The same polyester plastic developed for textiles, and later for film, is being employed in a somewhat expensive but highly efficient rope for specialized uses. For some purposes an elastic rope is desirable, particularly for glider tow lines, but the new rope is employed where little stretch is desired. Its breaking strength is said to be twice that of ordinary rope. It is water-repellent and is impervious to acids and greases. It also may be employed as a cable core.

Agricultural Chemicals.—Antibiotics in extremely dilute solutions (100 parts per million of water) are successfully controlling a number of fungal and bacterial diseases of plants, including mint rust, cherry leaf spot, apple scab, halo blight, black leg in potatoes, and tobacco blue mould. This is a relatively new development in agriculture.

A variety of compounds with halogenated benzene rings, some of which are also carbamates or ureas, are being applied in a very shallow soil layer after planting to kill weed seeds before crop plants break through. Such treatment does away with hand-weeding, and only about one third as much chemical is required as when weeds are killed later. Special application machinery has been developed for this purpose. Most of these pre-emergence herbicides are used by commercial market gardeners, but there has been limited application also in the growing of peanuts. (See also AGRICULTURAL RESEARCH SERVICE; HORTICULTURE.)

(For prizes in the field of chemistry, see PRIZES AND AWARDS; and for further references to chemical subjects, see the Index entry, *Chemistry*.)

W. T. READ,
Chemical Consultant, Department of the Army.

CHEMOTHERAPY. Chlorpromazine.—By far the most encouraging chemomedical development since the discovery of penicillin and the sulfa drugs has been the new drug, chlorpromazine, discovered in France and first used in the United

States in 1954. This drug works in the mysterious corridors of the subconscious mind, or more specifically, in that sector of the brain known as the thalamus.

Since the highly complicated nerve circuits of this region permeate to every part of the human system, a variety of disease conditions, ranging from the "jitters" to the most violent forms of insanity, can be affected by the new drug, whose outstanding feature is its calming effect on jangled nerves.

Particularly spectacular is the fact that the sedative effects in most cases are achieved without rendering the patient unconscious or producing serious after effects. On the contrary, the drug dissipates the "hangover" that stems from such excesses as chronic alcoholism and various forms of drug (particularly narcotics) addiction. The new drug also mitigates the agonies attendant on the withdrawal of drugs from the addict.

Chlorpromazine may be of equal value to the surgeon, especially in precarious operations such as those on the heart or brain. The slowed-down metabolism and blood flow required by such operations is readily brought about by the new therapy.

The dangerous exhaustion resulting from hiccups which persist for months can be relieved, and the pain of inoperable cancer can be lessened by chlorpromazine treatment. Furthermore, many phobias and obsessions can be so exposed as to render adjustment more likely. In fact, the favorable relaxation achieved by chlorpromazine is in many ways similar to that produced by reserpine, a drug derived from the plant, *Rauwolfia serpentina*. Unlike the former, however, reserpine has its greatest effect in lowering the blood pressure.

Chlorpromazine in its present state of development, however, has its limitations. Its side effects can be exceedingly serious in some cases. The occasional individual whose white corpuscles are depleted to the point of agranulocytosis by chlorpromazine treatment emphasizes the need for extreme caution. Even more serious are the Parkinsonian-like responses—the shuffling gait, the tremor, the utter blankness of expression. Fortunately these symptoms regress on withdrawal of the drug. Again, its rather characteristic ability to intensify the action of other sedatives increases the danger inherent in the use of "sleeping pills."

Kalash (K-54).—Another mental health development especially promising in its preventive effects in the area of psychoneurosis is the treatment that employs a new vitamin preparation known as Kalash, or K-54. Developed by Drs. Watson and Comrey of the University of Southern California and the University of California at Los Angeles, respectively, this treatment marks a radical departure from the traditional Freudian approach to mental therapy. The high percentage of favorable results in statistically significant numbers of cases has proved the development to be worthy of further attention.

Natural Immunity.—It has finally become apparent that antibiotics cannot function as miracle exterminators of microbes quite independently of the animal body in which they act. That the latter has an important role to play, this author stressed in his book on sulfa drugs more than 20 years ago. In therapeutic practice, however, the view was largely ignored until recently.

Isoniazid is the drug largely responsible for closing the doors of so many tuberculosis sanatoriums recently, yet it is now known that a soluble extract of the microbe itself can so rein-

force the drug's action that, experimentally at least, complete protection results. Such results were obtained under conditions in which the control animals were fatally infected, and even in which the protective BCG vaccine alone could only delay eventual death.

In the same vein, cortisone now appears to be such an important adjunct in the treatment of tuberculous meningitis that 50 per cent of a series of controlled cases treated with cortisone recovered without neurologic complications, and much more rapidly than did the cases which did not receive cortisone. These results indicate that one of the body's hormones is a factor in its well-known resistance to tuberculosis. By the same token, they help to explain the vulnerability of certain experimental animals to the disease when the adrenal glands are largely removed.

It is startling to note that isoniazid, under the trade name Marsilid (Hoffmann-LaRoche), is reported to be able to stimulate the antimicrobial activities of the body's tissues to such an extent that certain chronic infections are cured despite the resistance of their microbes to antibiotics.

From an extract of beef brain there has been isolated a substance which inhibits penicillin-resistant microbes. In mice, it has cut mortality from 80 per cent to 1 per cent. Furthermore, immunity may be produced for as long as six months. The experimenters incline to the view that the substance is one fragment in the natural immunity mosaic. Paradoxically, this substance may even stimulate the growth of virulent microbes, while simultaneously depriving them of their ability to produce toxin.

It has become increasingly clearer that the old idea of a mass sterilization of microbes in vivo has proved to be a crude approach to the problem which must take into serious consideration the anti-infectious nutritional resources of the body itself.

CHIANG KAI-SHEK, Chinese political and military leader: b. Chikow, District of Fenghua, Chekiang Province, China, Oct. 31, 1887. Leader of the Chinese Nationalist Party (Kuomintang) since the death of Dr. Sun Yat-sen in 1925, he was inaugurated as China's first constitutional president on May 20, 1948, but under Chinese Communist military pressure, retreated to Formosa with the Nationalist government in December 1949. There he formed a government in exile of which he was president.

The international crisis brought about in January 1955 by the threatened invasion by Communist China of the Nationalist-held offshore islands and of Formosa itself focused world attention on Chiang Kai-shek's government. From the beginning, his position was that the United Nations proposal of a cease-fire in the Formosa Strait was unacceptable to his government; that the widely discussed idea of "two Chinas" could not be admitted; and that Nationalist China would fight alone, if necessary, to retain the offshore islands of Quemoy and Matsu. In December 1955 it was reported that Chiang had rejected two appeals from President Eisenhower to cooperate in the approval of Outer Mongolia as one of 18 nations to be admitted to United Nations membership. (See also FORMOSA.)

CHICAGO. Second most populous city in the United States (1950 census: 3,620,962) and center of the second most populous standard metropolitan area (5,495,364), Chicago, Ill., covers a land area of 213 square miles.

State legislative activity in 1955 transferred budget-making power from the City Council (50 aldermen) and the mayor to the mayor alone, increased the independent authority of the city purchasing agent, and rigidified conditions for granting zoning variations. Chicago's representation in the state legislature was established at 18 senators out of 58 and at 69 representatives out of 177, in the first reapportionment in 44 years. The City Council created the office of chief administrative officer, under the mayor, and streamlined council procedures.

On Aug. 1, 1955, the city began to levy an occupational excise (sales) tax of $\frac{1}{2}$ of 1% on retailers, the first broad-based nonproperty tax ever levied in Chicago. It is estimated that the tax will net Chicago not less than \$21 million annually. Ordinances imposing a consumers' utility tax, for which permission was also granted by the state, passed the City Council late in 1955. Official estimates of annual yield were between \$8 million and \$9 million.

The city's budget appropriations for all corporate purposes (1955): \$121,436,117.62; corporate tax rate: \$0.61 per \$100 of assessed valuation. An additional \$122,296,660 was levied for all school purposes. Outstanding debt (Jan. 1, 1955): \$333,952,000.

Estimated value of industrial output of Chicago metropolitan area in 1954: \$17 billion, including \$2.3 billion for steel (17,506,400 tons) and other primary metals, and \$2,220 million for meat products and other processed foods. Steel output in the first 8 months of 1955 was 14,239,100 tons, a new record. Industrial plant investments during the first 9 months of 1955 were \$258,970,000 (full year 1954: \$231,683,000). Metropolitan retail sales in 1954 were estimated at \$7 billion.

Activity and planning for physical improvements continued unabated throughout 1955. Chicago's housing program (64,972 new dwelling units from 1950 through 1954) achieved national recognition in February as Chicago won a National Municipal League award for its program of neighborhood conservation and slum prevention. Work continued on the Congress Street Expressway, which by 1956 will link the western suburbs with downtown Chicago. Plans were further developed for the \$400 million Fort Dearborn project, involving the tearing down of 40 blocks of slums, and the building of a civic center on the near North Side. Completion in 1955 of the 41-story, \$40 million home of the Prudential Insurance Company gave Chicago its first new office skyscraper in 20 years. The state legislature created a Metropolitan Fair and Exposition Authority empowered to construct a convention hall in Chicago. By late 1955 a comprehensive zoning ordinance, the first major revision since 1942, was virtually completed.

City government leadership changed hands following the election of April 5, 1955, when Richard J. Daley, Cook County clerk and county Democratic chairman, was elected mayor over Republican Robert E. Merriam, a young member of the City Council. With Daley were elected Morris B. Sachs as city treasurer and John Marcin as city clerk. Highlights of the campaign were the Democratic primary of February 22, in which Daley defeated the incumbent mayor, Martin Kennelly, and the subsequent juggling of the Democratic ticket when the original nominee for clerk, faced with disbarment proceedings, resigned from the ticket.

CHILD LABOR. SEE WAGE AND HOUR AND PUBLIC CONTRACTS DIVISIONS.

CHILD WELFARE. The substantial increase in the world's population in 1955 was more significant than any advance in child welfare made during a rather uneventful year. The reduction of infant mortality in several of the less privileged countries was impressive. Birth rates were sustained or increased in most countries, including the United States. The added baby crop, plus measures effective in prolonging life, posed a challenge to those who through the years have seen famine and pestilence reduce population in the most densely populated areas. Governments appropriated funds to improve the lot of children, influenced in part by the many international child welfare programs which in recent years have stimulated countries to invest as never before in their children.

United Nations Services to Children.—The World Health Organization (WHO), longest established of those agencies within the United Nations committed to serving children, expanded its operations in 1955. The prevention and cure of communicable diseases continued to be a major objective, with WHO and the United Nations Children's Fund (UNICEF) sharing their resources and combining them with those of the governments of countries where projects were conducted. Malaria was the target of such efforts in Africa, Asia, and the Americas; and tuberculosis, yaws, and syphilis were treated to an unprecedented extent. In addition, nutrition programs were conducted in cooperation with the Food and Agriculture Organization of the United Nations (FAO). The protection of water supplies and the development of sanitary engineering were among other tasks aimed at reducing morbidity and mortality, especially among children. A consequence of these measures has been a

An Iraqi girl, suffering from bejel (a tropical disease) is given her first medical treatment by a UNICEF doctor.

marked increase in population, notably in Latin America, which now almost equals the population of Canada and the United States.

The rehabilitation of the handicapped has become a part of WHO programs in many countries, especially where sufficient professional services are available, as in Europe, Israel, and Japan. Studies of mental health under WHO auspices have attracted much attention. A 1955 report, *The Child in Hospital*, presented the findings of an international meeting held in Stockholm, Sweden, in September 1954.

The work of UNICEF was even more child centered than that of WHO. Its major mass health campaigns in 1955 included the vaccination of nearly 15 million children against tuberculosis, the protection of about 8.7 million children and mothers against malaria by the use of DDT, and the treatment of 2 million children and mothers for yaws, bejel, or syphilis, and of nearly 1.5 million for trachoma. Mass health and feeding objectives in 90 countries and territories reached about 32 million children and pregnant and nursing mothers in 1955. In addition, about 2.7 million children in 36 countries received UNICEF milk and other rations.

Special efforts in 1955 included relief for many of the 500,000 refugees in Saigon, South Viet-Nam. Distribution channels were shared by all welfare agencies, including UNICEF, the

Orphans being evacuated from Haiphong to Saigon, Viet-Nam, are fed by the crew of the U.S.S. *Marine Serpent*.

U.S. Foreign Operations Administration, CARE, Church World Service, the National Catholic Welfare Council, and the Vietnamese and French Red Cross Societies. Here, as in certain eastern Mediterranean areas, refugees were crowded, sometimes 60 in a family-sized tent, with survival uncertain for persons of all ages and especially for children.

A project for the control and eradication of trachoma in French Morocco reached large numbers, including more than 130,000 tribesmen. In the two-year period 1953-1955 more than 300,000 persons, mostly children, were protected or treated against this often blinding disease. As in most such campaigns against epidemics, UNICEF provided vehicles, drugs, and other supplies and materials, and WHO furnished professional staff. Their combined contributions cost about \$137,000 for one year, and the French government provided about \$400,000.

Production of milk was a 1955 UNICEF project in 18 countries where this food had been almost unavailable. Milk-drying, pasteurizing, or sterilizing plants were in operation. In Indonesia a milk substitute was being manufactured from a mixture of soybeans, peanuts, and malt, and fish flour was being used in child-feeding projects in countries where milk was unavailable. (See also UNITED NATIONS CHILDREN'S FUND; WORLD HEALTH ORGANIZATION.)

Canada.—The improvement of services to Canadian children continued in 1955. In several respects it paralleled similar developments in the United States, but in some ways Canada moved more rapidly.

By the end of June 1955, some 800,000 Canadian children had received two immunizing inoculations of Salk poliomyelitis vaccine. Plans were completed to give the third inoculation to the first group of children in the next school year and to immunize at least an additional 2 million children during 1955-56. The program is financed by the federal government and the provinces on an equal basis, using funds from the National Health Program.

During 1955 two provincial acts passed in 1954 became effective. These were the Child Welfare Act of Ontario, consolidating legislation for child protection, adoption, and children of unmarried parents; and the Social Assistance Act of Newfoundland, incorporating mothers' allowances and dependents' allowances.

There was continued emphasis on the early placement of children legally free for adoption. To facilitate cooperation by participating agencies in Ontario, a new Adoption Clearance Service began to publish a monthly bulletin (circulated to 55 children's aid societies) outlining the histories of children for whom it was hard to find suitable homes. Thus one children's aid society could obtain help from another in a distant part of the province and so expedite placements of children whose age, race, or handicaps tended to complicate home finding.

A Senate Committee on Narcotic Control in Canada received evidence on the extent of addiction among youth in Canada and concluded that there was no problem of childhood narcotic addiction in the country.

Interest in Canada concerning services for retarded children was concentrated in 1955 on keeping such children in their own homes. In Halifax, Nova Scotia, a special project was launched to make special classes available for retarded children and to provide transportation from their homes or foster homes. A continued

examination of institutional programs for children was also evident during the year. Both these fields were being studied by the Child Welfare Division of the Canadian Welfare Council. The concern of social agencies in problems of family desertion also was channeled into committee study through the council.

The problem of improving the staffing of child welfare agencies was considered as part of the larger question of personnel in social work by the personnel committee of the Canadian Welfare Council and other groups in studying the *Report of the Survey of Welfare Positions, 1954*, and at the regional meetings on social work education held during 1954-55 under the auspices of the joint committee convened by the National Committee of Canadian Schools of Social Work.

United States.—The child population of the United States increased from 47 million to about 56 million during the five years preceding 1955. In the first 11 months of 1954 infant mortality declined to 26.6 per 1,000 live births, the lowest percentage ever recorded. The number of births in 1954 reached an all-time high of 4,021,000.

The schools of the country were so crowded in 1955 that several states and many local communities were considering new sources of tax revenue to be used for school construction and increased operating budgets for educational purposes. Enrollments rose during the years 1950-55 by 25% in elementary schools and 16% in high schools, with further increases indicated for the school year 1955-1956. (See EDUCATION.)

The immunization of children against poliomyelitis was a major health project during 1955. After the Salk vaccine had been approved by public health authorities and the National Foundation for Infantile Paralysis, there was a clamor for it, with the foundation providing a free supply for the nearly 8,000,000 first- and second-grade children and the 1,390,000 children in a control group which did not receive the vaccine in 1954. Funds to purchase the vaccine were authorized by federal legislation and by similar action in several states. The development of a few cases of polio following the first dose of the vaccine led to retesting large quantities, with a consequent delay in resuming the program of vaccination. (See POLIOMYELITIS.)

Services to mentally retarded children were expanded during 1955. The National Association for Retarded Children and its affiliates in more than 40 states were continuing efforts to mobilize parents of such children. Objectives in these efforts included greater acceptance of mentally retarded children by their families and the community; earlier and more adequate diagnosis; extension and improvement of facilities for training in the home, public schools, and institutions; and research in medicine, psychology, and education. Massachusetts established a division of special education which was to classify all mentally retarded children of school age as being either educable, trainable, or custodial. Each town with five or more such children was to establish special classes for the educable and trainable.

The desegregation of public schools in those states with separate schools for Negro and white children was effected in a few communities in 1955. Most of these states anticipated the first steps in desegregation by September 1956, in keeping with the unanimous decision of the U.S. Supreme Court (May 17, 1954) declaring racial segregation in the public schools to be unconstitutional. (See EDUCATION.)

Child adoption received much professional and popular attention in 1955. The Child Welfare League of America sponsored a National Conference on Adoptions, held in Chicago, Ill., on January 26-29, and the federal Children's Bureau, on June 27-28, brought together in Washington, D.C., the representatives of 31 national agencies and organizations directly concerned with the three parties to adoption—the child, his natural parents, and adoptive applicants.

Juvenile delinquency remained a special concern of the U.S. Congress and various voluntary and governmental agencies throughout the country. A Congressional appropriation permitted expansion of Children's Bureau activities, especially through its Division of Juvenile Delinquency, established in 1954. The Children's Bureau announced that for the sixth year in succession juvenile delinquency continued to rise. About 475,000 young persons came to the attention of juvenile courts because of alleged delinquent behavior, and about 1,300,000 were picked up by the police. On May 19-21, 1955, a conference on health services and juvenile delinquency was held in Washington. Health workers studied means whereby they might improve understanding of personality development and be alert to early signs of maladjustment in children.

CHILDREN'S LITERATURE. In 1955 the topography of juvenile literature might best be described as resembling a high plateau. Probably the most interesting work was done in the fields of picture books and informational books. The former were characterized chiefly by illustrations in the modern manner and by stimulating presentations of aspects of the child's world.

Thus, in *See and Say* (judged the best illustrated book of the year by *The New York Times Book Review* jury) Antonio Frasconi pictured familiar objects with great style, and printed their names in four languages, producing an introduction to the multilingual world. Juliet Kepes' *Beasts from a Brush* was notable for the draftsman's work with which the author-artist portrayed fantastic animals. Taro Yashima's *Crow Boy* was a most moving tale of a lonely Japanese schoolboy, interpreted in brilliant impressionistic pictures.

One of the most original books of the year was Beatrice Schenck de Regniers' *A Little House of Your Own*, a humorous, understanding exploration of the child's need for privacy, illustrated by Irene Haas. Other noteworthy picture books were *Chaga*, by Will and Nicolas; *The Happy Lion in Africa*, by Louise Fatio and Roger Duvoisin; *Play With Me*, by Marie Hall Ets; and *Parsley*, Ludwig Bemelmans' slight story with magnificent pictures.

Marcia Brown was awarded the Caldecott Medal for the best illustrated book of 1954 for her *Cinderella* (see also AMERICAN LIBRARY ASSOCIATION).

The great body of informational books ranged in age appeal from Miriam Schlein's *It's About Time*, a study in time concepts for children of 6 to 9, to William E. Scheele's *The First Mammals*,

a distinguished pictorial and descriptive introduction to prehistoric mammals for readers of 10 up to adulthood. The current craze for dinosaurs was reflected in *Dinosaurs*, by Marie Halun Bloch, and *The True Book of Dinosaurs*, by Mary Lou Clark—the latter being the only book on the subject for children of the primary grades. Studies of contemporary animals were legion. Some, like Robert S. Lemmon's *All About Birds*, were written in strictly factual style; others, like Olive L. Earle's *The Swans of Willow Pond*, presented scientific nature facts in simple narratives.

Many other aspects of science were presented in readable form in such volumes as *Atoms Today and Tomorrow*, by Margaret O. Hyde; *The Wonderful World of Mathematics*, by Lancelot Hogben; an *Illustrated History of Science*, by F. Sherwood Taylor; and in biographies of scientists, such as *Steinmetz, Maker of Lightning*, by Sigmund O. Lavine; Eleanor Dooly's *The Radium Woman: A Life of Marie Curie* (based on Eve Curie's biography); and *Men, Microscopes and Living Things*, Katherine B. Shippen's sketches of great biologists.

Biography was less dominated by the series than during the past few years, although the Landmark Books retained their great popularity and, in general, their high standards. Among the independent studies for teen-agers were Constance Buel Burnett's perceptive life of *Elizabeth Barrett Browning*; *Prairie-Town Boy*, a condensed version of Carl Sandburg's *Always The Young Strangers* (it lost strength in the cutting but still remained a remarkable evocation of a period and a personality); *Harriet Tubman*, by Ann Petry, a life of the famous Negro conductor on the Underground Railroad; *Booker T. Washington*, by Shirley Graham; and *Korean Boy*, by Pak Jong Yong and Jock Carroll, a moving firsthand account of the effect of war upon a Korean family.

There were, inevitably, innumerable versions of the Crockett story, most of them ephemeral; but Walter Blair's *Davy Crockett: Frontier Hero and Davy Crockett*, by Stewart H. Holbrook, were substantial, readable, and informative. *Columbus*, by Ingri and Edgar d'Aulaire, was an outstanding example of biography for quite young children, colorful and appealing in both text and pictures.

It was encouraging to see a few handsome books on the arts: *The Dramatic Story of the Theatre*, by Dorothy and Joseph Samachson, a stimulating study from the Greeks to the present; Langston Hughes' *The First Book of Jazz*, a brief history and analysis done with a refreshing lack of pomposity; and Elizabeth Ripley's biography, *Rembrandt*.

Fiction for teen-agers was strong in quantity, but rather spotty as to quality, especially among the stories for older boys which, unfortunately, dealt more often with the past than the present. Outstanding, however, were Pulitzer Prize-winner Bruce Catton's *Banners at Shenandoah*, a brilliant recreation of the Civil War as seen by a young flag-bearer to Sheridan; *The Buffalo Trace*, by Virginia S. Eifert, a fictionalized narrative of Lincoln's pioneer forbears in Kentucky; and *The Silver Disk*, by Loring MacKaye, an intricate tale of Sicily during the boyhood reign of Frederick II. Among stories of contemporary life for older boys were *Santiago*, Ann Nolan Clark's thoughtful if rather long-winded study of a Guatemalan Indian seeking to find his place in a complex world; *Desert Storm*, by Logan Forster, a story

of an Apache boy and his horse; and *Pipeline Down the Valley*, by Shirley Sargent, a better-than-average story of a boy's adjustment to life through a job in the San Joaquin Valley.

One of the most amusing period stories for older girls was *The Pink Rose*, by Elspeth Woodward and Edward Roberts—something of a rarity in juvenile literature in that it was a comedy of manners—concerning a strong-minded débutante of 1902 who waged a private fight for independence. Mary Stolz, probably the most accomplished and provocative of novelists for the teenage reader, gave us a penetrating study of town-and-gown tensions in *Rosemary*, a story of a college town. D. V. Jackson's *Rising Star* was a study of a young girl's reluctant acceptance of her physical limitations, and was set—of all places—against the background of a Florida race track community. In *The Unwilling Heart*, Catherine Marshall explored the emotional and social problems of an embezzler's daughter in a typical, middle-class community.

Somewhere between the fiction for readers of the middle years and the teen-agers came E. C. Spykeman's *A Lemon and A Star*, a portrait of a family of uninhibited children at the turn of the century, sharply drawn, evocative, and devoid of sentimentality. Fiction for the intermediate readers was plentiful and varied. Mary Norton repeated the brilliant success of *The Borrowers* (an Edwardian fantasy) with her sequel, *The Borrowers Afield*. Jennie D. Lindquist's *The Golden Name Day* was a poetic, nostalgic story of life in a New England family of Swedish origin, combining the two traditions.

Other memorable stories were William Corbin's *Golden Mare*, a moving, off-beat story of a boy and his old mare; *Beezus and Ramona*, one of Beverly Cleary's deft comedies of everyday life, with serious undertones; *Evie and the Wonderful Kangaroo*, Irmengarde Eberle's rollicking extravaganza for the younger grades; and Meindert DeJong's *The Little Cow and the Turtle*, which, like all that author's work, had an odd, almost hypnotic charm. Mr. DeJong was awarded the American Library Association's Newbery Medal for his *The Wheel on the School*, judged the most distinguished American children's book of 1954. (See also CANADIAN LITERATURE.)

ELLEN LEWIS BUELL,
Editor of Children's Books, "The New York Times Book Review."

CHILE. With an area of 286,396 square miles, Chile has a Pacific coastline of 2,653 miles, and extends from 17° 30' south latitude in the north to 56° south latitude at Cape Horn, but its width from east to west is nowhere greater than 221 miles. The eastern boundary lies in the Andes Mountains, a barrier which separates Chile from Bolivia and Argentina. Chile is divided into three major geographic regions: the Atacama Desert in the north, with its rich copper and nitrate deposits; the cold, rainy, forested south; and middle Chile, the economic, political, and social heart of the nation.

Population.—On June 30, 1955, the population was estimated at 6,560,000, an increase of about 11% since the April 1952 census (5,930,809). With a 1953 birth rate of only 2.8 persons per 1,000 population greater than the 1940 figure, much of this rapid growth is accounted for by a steadily decreasing death rate. Infant deaths, for example, averaged 240.6 per 1,000 births from 1935–39, but only 114.3 in 1953. Some 90% of Chile's population is concentrated in the middle third of the country where the five largest cities are found. These cities, with 1952 census figures, are: Santiago, the capital (1,348,283); Valparaíso (222,238) and its fashionable resort suburb, Viña del Mar (88,196); Concepción

(133,580); and Valdivia (45,138). About 66% of the total population are mestizos, 25% are of European descent, primarily Spanish, and 9% are Indians.

Government.—The constitution of Oct. 18, 1925, established a unitary and republican form of government. The president, Gen. Carlos Ibáñez del Campo, who assumed office on Nov. 3, 1952, is elected popularly for a 6-year term and may not succeed himself. The 12-man cabinet may be questioned by Congress, but is responsible only to the chief executive. The 45-member Senate (5 from each of 9 provincial groups) and the 147-member Chamber of Deputies (1 for each 30,000 inhabitants) are elected directly for 8- and 4-year terms, respectively. The judicial system is headed by a 13-member Supreme Court.

Religion and Education.—The principal religion is Roman Catholicism (95% of the population are adherents), but church and state are constitutionally separated.

Education is free and compulsory for persons between 7 and 15 years of age, or until 4 years of schooling have been completed. Chile has over 4,000 public and 1,500 private primary schools, 100 public and 200 private secondary schools, and 1 private and 12 public normal schools. There are, besides the National University of Chile, 4 other institutions of college level. The School of Agronomy of The University of Concepción was recently opened, providing specialized technical training.

Finance.—Chile's budgetary cash deficit for 1954 was about 5 billion pesos* over the 82 billion peso budget for that year. The Ministry of Finance estimated total expenditures for 1955 at 111,590,000,000 pesos, but the estimated governmental income, despite tax increases, was set at only 91,641,078,917, resulting in a deficit of about 20 billion pesos. Bonuses and salary increases paid by the government to offset the mounting cost of living promised to make this deficit still greater.

Cost of Living.—The cost of living rose 72% in 1954 and another 56% in the first four months of 1955, resulting in strikes which often disrupted the economy. The cost of living index (1948 = 100) was 256 in 1953 and 687 in April 1955.

Industry. Manufacturing.—In order to meet the growing financial crisis, the government is encouraging industrial development. Machinery for a new paper mill, with an annual capacity of 60,000 to 70,000 tons, was due to arrive late in 1955. (Chile's paper production in 1953 was 63,-421.9 tons.) A dried-milk plant, producing 1 million kilos a year, is to be built in Chillán in 1956. A new hydroelectric power plant is in operation at Los Molles. Early in 1955 the government announced a 6-year plan, costing 3 billion pesos, for developing port facilities—primarily at San Antonio, which serves Santiago.

Mineral Production.—The new Concón oil refinery, 15 miles north of Valparaíso, completed its first year of activity in August 1955. One third of the crude oil refined came from Chile's own wells, which produced 270,000 cubic meters through 1954, 35% more than in 1953. Late in 1954 the government announced that certain districts were open for exploration and exploitation of oil reserves by foreign capital, but many areas remained restricted to the government-controlled Empresa Nacional del Petróleo.

On May 6, 1955, a new law favoring copper companies went into effect, and was expected to increase 1955 production to 480,000 tons, 30% above the 1954 output of 372,813.2 tons. The new law permits the companies to keep the full sales price, rather than returning 60% in income taxes as they previously did. Instead, a basic tax of 50%, plus a 25% surtax, is tied to production levels; but for each 1% increase over the base production level (95% of the 1949-53 average production), the surtax drops one eighth of 1%. The statute also liberalizes foreign exchange rates.

To stimulate nitrate output (1,420,243 gross metric tons in 1953), the government proposed amending the basic law governing that product on Dec. 10, 1954. The law would liberalize foreign exchange rates and amortization, but in-

crease the former 25% tax on profits to 40%. Producers would also supply nitrate to farmers at cost, plus 10%.

Agriculture.—Chile produces less than half of her food requirements. The National Agrarian Project, adopted in 1953 to increase farm output 38% over the next 8 years, was causing no spectacular rise in farm production. The output of barley (55,600 tons in the fiscal year 1953-54), oats (97,000), maize (97,000), sunflower seed (75,200), and potatoes (606,000) increased somewhat, but the 1953-54 wheat crop (955,-400 tons) fell short of Chile's domestic requirements of 48 million bushels by about 25%. Efforts are being made to settle agricultural areas through immigration; and work was going forward in 1955 on large-scale irrigation projects, one of which will improve 271,000 acres and open an additional 99,000 acres. The first sugar beet plant was opened at Los Angeles, and a large refrigerating plant was completed at Talcahuano.

Foreign Trade.—In 1953 total Chilean exports were 4,739,900 metric tons valued at \$414.1 million. Copper, the main source of income, accounted for about 51% of this total, or \$213.7 million. About 60% of Chile's copper exports are shipped to the United States. In 1954 total exports amounted to \$403 million, and total imports amounted to \$343 million. A large portion of export proceeds, however, remain abroad, which results in an unfavorable balance of trade. (Two American companies control most of Chile's copper production.) Besides the United States, the chief countries of trade are Argentina, Germany, Great Britain, and Peru.

Transportation and Communication.—In 1951 Chile had 5,224.7 miles of railways. In January 1955 the final link of the 2,300-mile railway system, which connects Arica, Chile, on the Pacific Ocean to Santos, Brazil, on the Atlantic Ocean, was completed between Corumbá, Brazil, and Santa Cruz, Bolivia.

In 1954 there were 30,203 miles of roads, of which 27,215 miles were motor roads, the remainder being cart roads. In 1954 Chile had 46,455 passenger cars, 36,083 trucks, and 4,320 motor buses. Chile has 1,357.8 miles of navigable rivers. In 1954 there were 145,139 telephones, of which 81,333 were in Santiago.

Principal Events, 1955.—Most of the political and economic events of 1955 centered around the problem of inflation. On April 11, President Carlos Ibáñez del Campo blamed the situation on political opposition. At that time 19 political parties were represented in Congress, and only one, with 25 deputies, consistently supported the president. On May 21, Ibáñez asked Congress for a fundamental constitutional reform to strengthen executive power. New cabinets were formed on January 6 (revised February 22), on May 30, and on August 12. The latter was the 11th cabinet appointed by Ibáñez since he took office.

A wave of strikes hit Chile during the summer. On May 31, 4,500 steel workers struck for increased wages, followed the next day by a strike of 42,000 government transportation and communication workers. The latter strike was settled on July 10 after promises of higher wages by the government. On August 24, 40,000 government workers struck, and on August 26 this group was joined by an additional 20,500. A state of emergency was ordered in Santiago, resulting in the arrest of approximately 1,000 workers on August 29. The strikes ended on September 4, when the government agreed to consider pay in-

* As of August 1955, U.S. \$1 = 300 pesos (principal export rate), 203 pesos (principal import rate), and 746 pesos (free rate).

creases of from 60 per cent to 100 per cent.

On September 22, José Maza, head of Chile's delegation to the United Nations, was elected president of the U.N. General Assembly.

University of Illinois.*

CHINA, Nationalist. See FORMOSA.

CHINA, People's Republic of.¹ A Communist-led republic of Asia, the largest in population and third largest in area of the countries of the world. Estimated area (including Tibet), 3,745,296 square miles; pop. (census of June 30, 1953), 582,603,417.² Han Chinese comprised 93.94% of the total population. Chief national minorities are the Chuang, Uigur, Hui, Yi, Tibetan, Miao, Manchu, Mongolian, Puyi, and Korean groups. There are also numerous aboriginal tribes in remote areas. Peking, formerly Peiping (pop. 1953, 2,768,149) is the capital; Shanghai (6,204,417) is the largest city; and Tientsin (2,693,831) the third largest city. Other large cities and populations (est. 1953) are: Mukden, 2.3 million; Canton, 1.6 million; Chungking, 1.6 million; and Wuhan, 1.4 million. The 1953 census reported the urban population as 13.3% of the total, but gave no definition of urban.

Government.—On the basis of elections held in the latter part of 1953, a 1,200-member National People's Congress convened in Peking, Sept. 15–28, 1954, and adopted the Constitution of the Chinese People's Republic.

The constitution designates the National People's Congress as the "supreme organ of state power." It is to be elected every four years by provincial congresses, members of the armed forces, and Chinese residents abroad, and is to meet once a year. Its functions are mainly legislative. Acting for the congress between sessions is the Standing Committee, a working body of about 80 members.

The chief executive officer and most powerful man in the government is the chairman of the republic, who is elected by the congress. Mao Tse-tung was re-elected chairman by the congress on Sept. 27, 1954. The executive body and highest administrative organ of the government is the State Council, or cabinet, consisting of about 35 ministries. Chou En-lai (q.v.) continued as premier and foreign minister in a cabinet endorsed by the congress on Sept. 28, 1954. Other important government bodies include the National Defense Council (headed by Mao Tse-tung) and the Supreme State Conference, a sort of inner cabinet.

Dominant political power is wielded by the Chinese Communist Party. At the head of the party is the Politburo, consisting of Mao Tse-tung (chairman), Liu Shao-ch'i (vice chairman), Chou En-lai, Chu Teh, and Ch'en Yun (who form the Central Secretariat, or inner core), and 8 other top political and military leaders. The power hierarchy extends downward through key party posts on the national and provincial levels in the government and the army, and through the mass organizations, such as labor unions, youth and women's organizations, and co-operatives. Communist Party membership in February 1954 was reported at 6.5 million.

Religion.—Confucianism has exerted strong influence on the Chinese way of life, although it has no formal church organization. Taoism and Buddhism, the other two principal faiths, are to some extent fused. Moslemism exists mainly in the Northwest. There are also an estimated 4 million Catholics and 1 million Protestants in China. Reverence for ancestors has been characteristic

¹ Data given in this article, unless otherwise specified, pertain to the Chinese mainland, or Communist China. For information on Nationalist China, see the article, FORMOSA.

² According to the National Bureau of Statistics in Peking, which claimed the census to be the most accurate in China's history, 574,205,940 persons were counted and 8,397,477 were reported by local governments in outlying areas. On the basis of sample surveys, the population was said to be increasing at an annual rate of 2%. The 1953 census figure is considerably above the 463,493,000 estimate (including Formosa) for 1948, contained in the *Statistical Yearbook, 1954* of the U.N. Statistical Office.

of the Chinese outlook, regardless of religious affiliation.

Education.—Primary education begins at the age of 7 and lasts 5 years. In addition to the regular primary schools, there are literacy classes and workers and peasants schools on the primary level. Many types of academic, vocational, and other training schools exist on the secondary and higher levels. Particular stress is placed on technical and engineering training. For the school year beginning in September 1955, enrollment in elementary and secondary schools was reported at a record 60 million students; in higher institutions, 289,000. Enrollments planned for 1957, with percentage increases over 1953, were reported in 1955 as: primary, 60,200,000 (18%); junior middle, 3,983,000 (78.6%); senior middle, 724,000 (178%); and higher, 434,000 (127%).

Finance.—Effective March 1, 1955, the official exchange rate of the yuan (people's dollar) was changed to 2.343 yuan=U.S.\$1.00 (previous rate, 23,430 yuan=U.S.\$1.00). The 1955 budget submitted by Finance Minister Li Hsien-nien to the National People's Congress on July 6, 1955, placed expenditure at 29,736.7 million yuan, and revenue at 31,192.5 million. Of the total expenditure, 47.72% was earmarked for economic development, 24.19% for defense; and 12.95% for social, cultural, and educational purposes. Expenditure in 1954 (in terms of the new yuan) was reported at 24,632.4 million (50.17% for economic development); revenue, 26,236.8 million. Principal sources of revenue in 1954 were taxes on industry and trade (45% of receipts), proceeds from state enterprises (35.9%), and taxes on agriculture (13.4%).

Five-Year Plan.—Communist China's first Five-Year Plan (1953–57) calls for a total investment in capital construction of 42,470 million yuan, divided as follows: industry, 58.2%; transport and communications, 19.2%; agriculture, forestry, and water conservation, 7.6%; culture, education, and public health, 7.2%; municipal and public utilities, 3.7%; banking and stockpiling, 3%; and miscellaneous, 1%. As part of the industrial effort, 694 large-scale enterprises are to be built or renovated, including 156 with Soviet aid; 15 new steam power stations, each with a capacity of over 50,000 kw., are to be erected; and 48 major projects are to be constructed or rebuilt at the Anshan steel center in the period ending in 1960.

In the agricultural sector, the 1957 target output of grain was reduced in 1955 to 192.8 million metric tons, a rise of 17.6% over 1952. (The original target called for a 30% rise.) Other 1957 goals adopted in 1955 were: cotton, 1,635,000 metric tons; jute and ambary hemp, 365,000; tobacco, 390,000; sugarcane, 13,150,000; and sugar beets, 2,135,000. The combined industrial and agricultural output was reported by Finance Minister Li Hsien-nien to have risen by 9.4% in 1954, and was scheduled to rise another 7% in 1955. Production increases planned for 1955 were: power, 19.3%; coal, 14.7%; crude oil, 31.6%; paper, 8.9%; sugar, 17.8%; cotton, 20.6%; and tobacco, 38%.

Industry.—Large-scale industrial enterprises are predominantly state-owned. State enterprises also control all of foreign trade, about 80% of wholesale trade, and 50% of retail trade. Output of the modern industrialized sector was reported to have increased by 18% in 1954, with pre-1949 peaks surpassed in virtually all manufacturing industries. Private enterprises, concentrated mainly in the consumer goods sector, contributed only

about 29% of the value of industrial output in 1954. In November 1955 a program was announced to accelerate "socialist transformation" of industry by extending the state-private partnerships in the private sphere.

Most of the new large-scale industries are located in the Northeast, China's heavy industry center. The Anshan Iron and Steel Company was reported in 1954 to be building a steel smelting plant, a steel sheet plant, 2 steel blooming mills, 2 automatic blast furnaces, 2 coke ovens, and other facilities. Other Northeast projects include expansion of coal production at Fusin, expansion of 5 power plants, and construction of 3 heavy machinery plants, 3 electrical engineering plants, and an automobile factory. Large steel mills are being built at Paotow, in Inner Mongolia, and at Wuhan, central China; smaller mills are being constructed at Tientsin, Tangshan, and Chungking. Additional large-scale projects outside the Northeast area are chiefly railroads and highways, power plants, cotton mills, a tractor factory in the north, and an oil refinery in Shanghai.

CHINA'S INDUSTRIAL EXPANSION

	1952	1954 est.	1957 goal
Steel ('000 metric tons).....	1,350	2,170	4,120

¹No official estimates. ²Output given as 4,600,000 bales of cotton yarn. (Source: State Planning Commissioner Li Fu-ch'un's report to the National People's Congress in Peking, July 6, 1955, as reported in the New York Times of that date.)

Electricity output rose an estimated 20% to 10,800 million kw.-hr. in 1954, when it was 56% over the pre-1949 peak. In late 1954 the first turbogenerator unit was installed at the hydroelectric power station of the Futseling Reservoir on the Hwai River, and in 1955 a new power station at the Kuanting Reservoir on the Yungting River was scheduled to begin operations, using turbogenerators produced by the new Harbin Electrical Machinery Plant. Output of machine tools and electrical appliances rose by 25% in 1954, and many new types of machines, vehicles, and instruments are now produced which were never before produced in China. Output of the chemicals industry (sulfuric acid, ammonium sulfate, caustic soda, and pure soda) rose by 43% in 1954. The chief consumer goods industry undergoing expansion is that of cotton textiles. Production of cotton piece goods in 1954 totaled an estimated 1,960 million meters, compared with 1,893 million in 1953 and 1,090 million in 1951. Much of the output of light industry has been criticized by the Communist press as of inferior quality.

Minerals.—Coal production in 1954 was reported at 81,990,000 metric tons, a rise of nearly 30% over 1952. Production of crude petroleum was said to have risen 32% in 1954, with activity expanding in the chief Northwest fields of Yümen, Wusu, and Yenchang, and at the shale oil refining center of Fushun, in the Northeast. China is the major antimony producer of the Far East and an important producer of tungsten, manganese, and tin ores. Production of tin concentrates in 1954 was estimated at 7,500 metric

tons. Other minerals include iron ore, bauxite, magnesite, pyrite, gypsum, phosphate, gold, and silver.

Agriculture.—By Nov. 10, 1955, some 1,240,000 producers cooperatives had been formed in agriculture, with 590,000 having been set up after July 31, 1955, when Mao Tse-tung called for accelerated mobilization of peasants in the land-pooling organizations. Thus, by the end of 1955, an estimated 30% of the country's 110 million farm households were in these cooperatives. Other forms of rural organization include mutual-aid teams, supply and marketing cooperatives, and credit cooperatives. State farms, as yet relatively unimportant, numbered 3,000 in 1954, including 102 mechanized farms.

Irrigation works completed in the period 1950-54 included 8.4 million ponds and ditches, 900,000 wells, and 600,000 pumps—adding a total of 4.1 million hectares to the area under irrigation (estimated at 43.2 million hectares in 1938). Comprehensive flood control projects, consisting mainly of detention of flood flow by series of lakes and depressions, are under way on the Hwai, Yungting, Liao, and other rivers. The disastrous flood of 1954, which affected about 10.7 million hectares of farmland, revealed that many of these projects had been inadequately constructed.

China produced 169.5 million metric tons of unprocessed primary foodstuffs in 1954, as compared with 166.8 million in 1953. Although rice output was below that of 1953, increases took place in wheat, maize, millet, and other coarse grains. Production of cotton in 1954 (prelim.) was estimated at 2,950,000 bales (3,200,000 in 1953). Estimated output of certain other crops in 1954 was: peanuts, 2,370,000 short tons; sesame seed, 715,000; tung oil, 77,000; rapeseed, 3,100,000; and soybeans, 321.5 million bushels. Other farm products include sugarcane, beet sugar, tobacco, jute and ambary hemp, vegetables, and livestock and poultry products.

Foreign Trade.—China's foreign trade in 1954 exceeded 8.4 billion yuan (about \$3.5 billion), according to Minister of Foreign Trade Yeh Chi-chuang's report to the National People's Congress on July 29, 1955. China's 1954 exports to non-Communist countries were estimated (by non-Chinese sources) at \$271.2 million; imports from those countries, \$285 million. Thus, the bulk of China's foreign trade is with the Soviet-bloc countries, such trade amounting to about \$2,016 million in 1953. The important non-Communist trading partners of China include Hong Kong, Ceylon, Japan, Switzerland, West Germany, and Great Britain. Some 89% of China's 1954 imports consisted of industrial installations and equipment, raw materials, chemical fertilizers, and other capital goods obtained chiefly from other Communist countries. China's principal exports are soybeans, groundnuts, tung oil, pig bristles, egg products, vegetable oils, food-grains, tea, silk, hemp, wool, furs, fruits, flued tobacco, antimony, tungsten, tin, and handicraft products.

Transportation.—China's railroad trackage in operation amounted to 15,835 miles at the end of 1954, with about 1,700 miles of new trackage having been constructed between 1950 and 1954. In 1955 an additional 620 miles were scheduled for construction, compared with 496 miles built in 1954. A 600-mile rail link between the Soviet Trans-Siberian Railway and the Chinese rail system, running through the Mongolian People's Republic, was completed in late 1955, the Chinese having built the segment from Tsining to Erhlien,

on the Mongolian border. Construction continued in 1955 on the strategic line running from Lanchow through Sinkiang, to connect with the Soviet rail network near Alma-Ata. By late 1955 the Chinese section extended beyond Changyeh.

At the end of 1953, 86,061 miles of roads were reported in operation, with about 25,000 miles having been either rehabilitated or newly built since 1949. An additional 2,670 miles of roads were reported to have been built in 1954. Outstanding among China's newly built roads are the 1,400-mile Sikang-Tibet highway and the 1,300-mile Chinghai-Tibet highway, both projects having utilized army as well as civilian labor in their construction. China's merchant shipping fleet totaled 659,000 gross registered tons in 1953. China's airline system was operated by a joint Sino-Soviet company until its dissolution and the assumption of full Chinese control at the beginning of 1955. Plans call for civil airlines to carry 8.1 million ton-kilometers of freight by 1957, more than treble that of 1952.

M. J. G.

THE YEAR 1955 IN COMMUNIST CHINA

For the Chinese Communists the year 1955 was one of vital importance. It was a year in which their policy of "liberating" Formosa entered a crucial period when any aggressive move might lead to war with the United States, the ally of Nationalist China. It was also a decisive year in the implementation of the Five-Year Plan (1953-57), for with about half of the volume of capital construction to be completed during the last two years of the plan, failure to carry out the schedule for 1955 would seriously jeopardize the plan's final fulfillment.

Economic Developments. *Industrialization.*—The 1955 national budget allotted for economic construction 14,188 million yuan, representing an increase of 14.81% over the figure for 1954 and accounting for 47.72% of total 1955 expenditures. Of the overall allotment for economic construction, 45.02% was allocated to industry, exceeding the figure for 1954 by 11.32%. Emphasis was placed on heavy industry, which received 89.20% of industrial expenditures. The Communists insisted that priority be given to expansion of the means of production so as to achieve economic independence and consolidate national defense. They maintained that once heavy industry had reached a high degree of development, light industry could be developed without difficulty. Until then any large-scale increase in the production of consumer goods and the betterment of the life of the people would have to wait.

Because of the failure of heavy industry to fulfill 1954 targets, cadres were ordered to make special efforts in 1955 to raise the standard of

technical and organizational management. In May, an overall economy drive, calling for stringent austerity and denouncing waste on nonproductive projects, was launched. It was strongly urged that building costs be cut 10 to 15%.

Agricultural Development.—Agriculture occupied an important position in Communist China's economic plan for 1955, since agricultural products not only supplied the food of the people and the raw materials for more than 50% of industrial products, but also were exported to earn the bulk of the foreign exchange needed to pay for imported industrial materials. During the years 1953 and 1954, agricultural production, partly because of serious natural disasters, did not fulfill the original plans for production increases, and it was the Communist plan in 1955 to make up as much as possible for the losses suffered in the preceding two years.

The target for 1955 was 10 million tons of grain. Cotton production was to be increased 20.6%, tobacco 38%, and sugarcane 16%. The output of oilseeds, tea, hemp, and livestock was also to be raised. Collectivization of rural areas was to be furthered vigorously in order to fulfill agricultural plans and to achieve by 1957 the basic organization of China's agriculture into semisocialist cooperatives. In the spring of 1955 agricultural producer cooperatives reached a total of 650,000 and comprised 15% of all peasant households. At a meeting of the Central Committee of the Communist Party in October, it was resolved to increase the number of such cooperatives to 1,300,000.

Despite the Communists' vigorous efforts to increase agricultural production, grain shortages were reported in several areas, particularly near Shanghai and in Kwangtung and Shantung provinces. While the Communists blamed natural calamities, they were also concerned over man-made difficulties. They seemed to be particularly disturbed by excessive haste to achieve collectivization. The April 1955 issue of the magazine *Hsüeh Hsi* (*Study*), for instance, declared that voluntarism was the fundamental principle of agricultural collectivization, and that it was wrong to force the peasants into any form of collectivized agriculture.

Measures adopted to deal with the grain shortage included: (1) a food austerity campaign calling on the people to economize on food consumption and to curb waste; (2) a nationwide campaign for the "rectification of food sales," with the purpose of reducing by at least 20 to 30% government sales of rationed food to rural consumers; (3) extension of stricter grain rationing to all municipal areas, grain being allotted to each person according to his age, type of work, and regional food habits; and requirements for farmers to sell 80 to 90% of any surpluses to the government; and (4) an intensified "back-to-the-farm" drive in Shanghai and other large cities, under which hundreds of thousands of persons were sent to the villages so as to increase food production and reduce the number of urban mouths to feed.

Domestic and Foreign Trade.—The total value of retail sales for 1955 was expected to exceed that of 1954 by 9%. Government and co-operative trading concerns were expected to account for 51.7% of all such sales.

During the year, Communist China continued its efforts to develop foreign trade. Trade agreements were concluded with Rumania (January 20), the Soviet Union (February 11), and Poland (March 21), and trade was developed with

U.S. airmen, captured by Chinese Communists during Korean War, cross bridge to freedom at Hong Kong, Aug. 4, 1955, four days after their release from prison.

WIDE WORLD

India, Burma, Indonesia, Ceylon, and Pakistan. In addition, efforts were made to establish trade relations with Afghanistan, Egypt, and Syria. A three-year trade agreement signed with Egypt on August 22 provided for an exchange of \$56 million in its first year of operation.

The Chinese Communists were eager to utilize trade relations in order to develop diplomatic relations. In the trade agreement concluded at Tokyo on May 4 between a Chinese trade delegation and a private Japanese businessmen's association, which provided for an exchange of goods of \$84 million in either direction, it was stipulated that both parties would urge their respective governments to hold official negotiations on the question of trade.

Political Situation. Government.—The second session of the National People's Congress was held in Peking (Peiping) on July 5-30, 1955. One of its major actions was the adoption of the Five-Year Plan, which had undergone much revision in the preceding two years. The Congress reorganized the economic administration by abolishing the Ministry of Fuel Industry and by establishing four new ministries: Coal Industry, Electric Power Industry, Petroleum Industry, and Purchase of Agricultural Supplies. In addition, it adopted a military service law which substituted compulsory service for voluntary enlistment.

The Communist government gave much attention in 1955 to the frontier provinces. On July 30, the National People's Congress ratified the decision of the State Council (cabinet) to abolish the provinces of Jehol and Sikang. On September 13, the Sinkiang Uigur Autonomous Region was established to control three fourths of Sinkiang's population of 4,000,000. This was interpreted in some quarters as a move to recognize the growing Soviet influence in the area.

The Purge.—The purge of Kao Kang and Jao Shu-shih was announced by a national conference of the Chinese Communist Party on March 31, 1955. Kao Kang, former political boss of Manchuria and head of the State Planning Commission, had lost favor with the party in 1954. It was not until this conference, however, that he was publicly condemned for undermining party solidarity and unity, for making the north-eastern area an independent kingdom, and for attempting to instigate party members in the army to support his conspiracy against the leadership of the party. The conference made a passing mention of his suicide, but castigated it as "an expression of his ultimate betrayal of the party." Jao Shu-shih, former regional boss in eastern China and director of the party's Department of Organization, was expelled from the party for his "alliance" with Kao. Seven lesser figures were also punished.

Parallel with the purge of Kao and Jao, the Communists launched a series of drives against the intellectuals. A new ideological campaign against the "bourgeois idealism of Hu Shih," begun in the fall of 1954, was continued in 1955. In the spring numerous meetings were held by academic, literary, and educational organizations to denounce the "reactionary literary thought" and the "subjective pragmatism" of Hu Shih.

But it was in the case of Hu Feng that the Chinese Communists really dramatized their demands for ideological uniformity. Hu Feng, active in left-wing Chinese literary circles, had been regarded as a Marxist writer and critic. He had thrown his lot in with the Communists before they came to power, and was later elected

EASTFOTO

Communist China's Chairman Mao Tse-tung (l.) and North Viet-Nam's President Ho Chi Minh in Peking, July 1955.

to the National People's Congress. In February 1955, at a meeting of the Union of Chinese Writers, he was charged with viewing literature and art subjectively and Marxism-Leninism as a cold doctrine damaging to creative activity. He was arrested in July on the charge of creating an antiparty literary clique which had infiltrated the Communist Party and revolutionary ranks.

Suppression of "Counterrevolutionaries."—The year 1955 saw numerous reports on "counterrevolutionaries hidden among the people." The Communists were particularly determined to suppress the Taoist sects. There were many of these sects, with such names as I Kuan Tao, Ta Fu Tao, Ming Yen Chiao, Shen Hsien Tao, and Hsin Tien Tao, whose activities extended from Kalgan in the north to Kwangtung Province in the south. In Hupeh Province, for instance, Taoist activities were reported in 30 districts and municipal areas during the first quarter of 1955. In the provinces of Hopeh, Shansi, and Kansu alone, more than 150 caves, some of them able to hold 30 persons, were discovered. One of the common charges against the Taoist sects was that they sabotaged the agricultural cooperatives and induced the peasants not to sell grain to the government.

Other "counterrevolutionary" elements named by the Chinese Communists were the alleged "United States-Chiang Kai-shek spies" and the "remnant counterrevolutionaries of the hostile classes." Their activities were discovered in all parts of China. Severe sentences were inflicted on those arrested by the Communist police on charges of gathering intelligence, establishing underground organizations, plotting riots, and other sabotaging activities. According to the report of Shih Liang, Communist minister of justice, from January 1954 to May 1955 the people's courts dealt with 364,000 "counterrevolutionary" cases.

Foreign Relations. Formosa.—In the mutual defense treaty signed with Nationalist China on Dec. 2, 1954, the United States pledged itself to defend Formosa in case of armed attack on Nationalist territory. The treaty covered the Pescadores, but it was not clear whether it included other Nationalist-held islands off the China coast. The Chinese Communists, while hesitating to challenge the U.S. Seventh Fleet guarding Formosa, took advantage of the uncertain United States position toward the offshore islands. On Jan. 18, 1955, the Communists captured Yikiang Island, a Nationalist outpost off the coast of Chekiang Province, 7.5 miles northwest of the Tachen Islands. With the fall of Yikiang, the

Tachens were exposed to attack. The United States government advised the Nationalists to evacuate, and on February 7, with the assistance of the U.S. Seventh Fleet, the evacuation of the Tachens began. The Chinese Communists had declared that United States participation in the evacuation might precipitate "a major war," but they took no action as the operation was smoothly completed on February 11.

After the Tachens, world attention centered on the Quemoy and Matsu island groups. Reports were rife that the Communists would strike at these islands, while the Nationalists resolutely rejected the idea of further retreat. The United States government, though refusing to commit itself to the defense of the two island groups, made it known that it would not exclude fighting if the attack on these islands appeared to be a preliminary to an attack on Formosa.

Meanwhile, the U.N. Security Council decided to consider the Formosa question. In a resolution passed (9-1, with 1 abstention) on January 31, it invited Communist China to send a representative to be present during the discussions. The invitation was rejected on February 3 by Premier Chou En-lai, who declared that the representatives of Nationalist China first must be ousted from the Security Council; then, with the Communists sitting in their place, his government would discuss "acts of aggression" by the United States in the Formosa area. The harsh terms of the Communists shattered the hopes of holding any Security Council session on Formosa. On October 1, the Communists reaffirmed their determination to "liberate" the island. (See also FORMOSA.)

Asia and Africa.—In Asia, Communist China was eager to play the role of the leading power. In 1953 it had agreed to give 8 billion (old) yuan to North Korea, and in July 1955 it decided to give North Viet-Nam the equivalent sum of 800 million (new) yuan (\$338 million).

When the Asian-African Conference (q.v.) met at Bandung, Indonesia, on April 18-24, 1955, the Chinese Communists welcomed it as an opportunity to exert their leadership and dis-

seminate their propaganda. But no sooner had the conference opened than they encountered vigorous attacks. The representatives of Iraq, Pakistan, and the Philippines all warned of a new imperialism masquerading in the guise of liberation. In a stirring speech on April 21, Sir John Kotelawala, prime minister of Ceylon, called attention to subversive Communist movements in Asia and Africa and reminded his fellow delegates that the Communists themselves had not concealed their aim of transforming other countries into their satellites.

Though irritated, the Chinese Communists could not afford to make the conference a failure. They therefore adopted a policy of striving for unity instead of stressing divergences. Throughout the conference, Chou En-lai managed to be conciliatory and pleasant, and his smiles softened the attitude of some of his opponents. In order to cultivate the friendship of the Arab countries, he lent his support to the nationalists of French North Africa and to the Arabs of Palestine. To demonstrate his "goodwill" toward the Indonesian people and to secure favorable propaganda from his action, he signed at Bandung on April 22 a dual nationality treaty with Indonesia, settling the latter's complaint concerning Chinese simultaneously holding two nationalities. In response to an invitation delivered by Chou at the conference, the Indian diplomat, V. K. Krishna Menon, visited Peking on May 11-21 to discuss various aspects of the Formosa question.

The United States.—On April 23, Chou En-lai declared at the Bandung Conference that Communist China did not want to fight a war with the United States, and that it was willing to sit down and negotiate with the United States government on the question of relaxing tension in the Far East, especially in the Formosa area. Three days later, U.S. Secretary of State John Foster Dulles indicated in a news conference that the United States government was willing to negotiate directly with Communist China for a "cease-fire" in Formosa Strait. He added that Nationalist China would not necessarily have to be present at talks limited to the question of a cease-fire. What Communist China wanted with the United States in the negotiations, however, was the "liberation" of Formosa by peaceful means. Chou En-lai therefore declared the United States stand to be "evasive and equivocal," and renewed his support of a Soviet proposal of February 4 for a 10-power conference on the Formosa question. International discussion of a possible large conference reached an impasse, however, because the Communists insisted on excluding Nationalist China.

The Far Eastern problem was not raised at the Geneva Conference (q.v.), but on July 25, two days after the close of the conference, the United States and Communist China announced that talks between ambassadors of the two countries would be held on the release of detained civilians and "other practical matters." Meanwhile, on May 31, 4 United States airmen who had been imprisoned in Communist China reached Hong Kong after their release from jail. On August 1, U. Alexis Johnson, United States ambassador to Czechoslovakia, and Wang Pingnan, Communist Chinese ambassador to Poland, began their talks at Geneva. The Communist representative notified the United States that 11 airmen imprisoned as "spies" had been released the day before (they reached Hong Kong on August 4). After much parrying and stalling, the two sides came to an agreement on September 10.

"DIDN'T I MEET YOU AT PANMUNJOM?"

WARREN IN THE CINCINNATI ENQUIRER

This provided that citizens of either country who desired to return home were entitled to do so, and that if they should encounter any obstruction to their departure, Chinese might apply to the Indian embassy in Washington, and Americans to the office of the British chargé d'affaires in Peking, for assistance.

Having completed the first phase of the Geneva talks, the Communist representative pressed forward with negotiations on the second item on the agenda—"other practical matters" at issue between the two countries. He proposed to focus discussion on two questions: (1) the trade embargo directed against Peking; and (2) the question of preparing for higher-level negotiations between the two countries. The United States government, however, refused to discuss these questions until all the American civilians held in China were returned. By late December, 13 American civilian prisoners and approximately 40 other Americans still remained in China. Meanwhile, on October 8, 39 Chinese returned to Communist China from the United States.

The Soviet Union.—In 1955, Communist China and the Soviet Union continued to maintain a united front in international affairs. On the questions of Formosa, the unification of Germany, the resumption of relations with Japan, and the rapprochement with Yugoslavia, the two countries cooperated closely in their policy and actions. The Soviet Union supported, though again unsuccessfully, Peking's claim to China's seat in the United Nations and, on January 31, charged the United States with "acts of aggression" in the Formosa area. On the other hand, Communist China's proposal to sit down and negotiate with the United States was parallel with the so-called soft line adopted by the Soviet Union at the Geneva Conference.

In a protocol of April 29, the Soviet Union agreed to give Communist China experimental atomic piles and technical assistance in the peaceful use of atomic energy. In May the Soviet government withdrew its armed forces from the Port Arthur area in accordance with the agreement of October 1954, and on July 5 it was announced in Peking that the two countries had signed an agreement to exchange scientific and technical information.

(For a discussion of Nationalist government activities in 1955, see the article FORMOSA; and for further references to developments in China, see the Index entry, *China*.)

CHESTER C. TAN,
Lecturer in Public Affairs and Regional
Studies, New York University.

CHIROPRACTIC. Chiropractic is a science based on the premise that disease results from lack of normal nerve function. The doctor of chiropractic treats, by scientific manipulation and specific adjustment, the structures of the body, and uses clinical nutrition, psychotherapy, and physiotherapeutic measures, as indicated, to restore normal nerve function, thereby enabling the protective and restorative powers of the body to function normally. Since 1895, over 33,000,000 people have been served by some 25,000 chiropractors throughout the United States.

Forty-three states, the District of Columbia, Alaska, Hawaii, Puerto Rico, and five Canadian provinces now require professional education of four academic years as a minimum licensing requirement. (The National Council on Education, official accrediting agency of the profession, announced that only eight chiropractic schools had

continued to receive accredited ratings in 1955.) Some 22 states demand two years of pre-professional education. Licensing regulations were established in Mexico in June 1955.

The 60th Anniversary Convention of the National Chiropractic Association was held July 4-8, 1955, at Hotel Claridge, Atlantic City, N.J., with some 1,200 persons in attendance. Highlighting the convention agenda was a series of scientific symposia covering important developments in diagnostic procedure, adjusting technic, X-ray interpretation, poliomyelitis, physiotherapeutic practices, and public health problems. The 61st convention will be held at the Morrison Hotel, Chicago, Ill., July 1-6, 1956.

Among the other important activities in the chiropractic field during 1955 were: (1) the production of a 15-minute sound and color picture entitled *How Do You Stand*, a public service feature which emphasizes the importance of correct posture and its relationship to health; (2) the publishing of a new series of educational advertisements in the magazines *Editor and Publisher*, *American Press*, and *Broadcasting Telecasting*, to inform the press about the many advancements of the profession in the health field during the past decade; and (3) the increasing of the circulation of *Healthways* magazine to more than 1,500,000 copies annually.

Additional information may be obtained from the National Chiropractic Association, National Building, Webster City, Iowa.

Executive Secretary, National Chiropractic
Association, Inc.

CHOCOLATE. See COCOA; CONFECTIONERY.

CHOU EN-LAI, premier of Communist China: b. Huaiyin, Kiangsu Province, China, 1898. A member of the Communist Party from early manhood, and a leading Chinese political figure from the 1920's, he became premier and foreign minister of the People's Republic of China on Oct. 1, 1949.

In early January 1955, U.N. Secretary General Dag Hammarskjöld visited Chou En-lai in Peking to attempt to persuade him to release 11 American airmen held as prisoners by the Chinese. (The airmen were freed on July 31 and reached Hong Kong on August 4.) Later in January, when a Communist Chinese invasion of Formosa seemed imminent, Chou bluntly refused to accept an invitation from the United Nations to discuss the Formosa problem unless his government were given Nationalist China's seat on the U.N. Security Council.

At the Asian-African Conference (q.v.), where Chou was a central figure, he created a favorable impression among many of the delegates by his conciliatory attitude on many issues. Although he attacked the United States in his opening address at the conference, in speeches given elsewhere later in May and in June he expressed the willingness of his government to negotiate with the United States over the future of Formosa. (See also CHINA—*The Year 1955 in Communist China*.)

CHRISTIAN SCIENCE. Television and radio activities were strengthened and expanded by The Mother Church, The First Church of Christ, Scientist, in Boston, Mass., during 1955.

The new filmed television series, *How Christian Science Heals*, featured documented accounts of spiritual healing, and personal testimonials of religious experiences. Complete and

permanent healings of many types of physical ailments were recounted in the programs by those who experienced them. They also gave actual examples of how many other types of human problems, such as relations with others, business difficulties, and character problems, can be solved through spiritual understanding of God.

The denomination's radio programs, which include the series also entitled *How Christian Science Heals*, were heard over some 800 radio stations in the United States, Canada, South America, South Africa, and Continental Europe.

More widespread acceptance of divine healing was reported during 1955 by many departments of The Mother Church, and continued growth in church membership was also reported. As of the Annual Meeting in June 1955, The Mother Church had 3,161 branch churches and societies in some 46 countries. Thirty-one new branches were recognized during the year. Included were those in Salzburg, Austria; Upper Hutt, New Zealand; Freemantle, Australia; Aarhus, Denmark; Kyoto, Japan; Heidelberg, Germany; and Caracas, Venezuela.

During 1955, hundreds of insurance companies recognized the services of Christian Science practitioners, nurses, and sanatoriums. A growing number of companies added special Christian Science riders to their automobile, medical expense, health and accident, and general liability insurance contracts.

New translations of certain of the writings of Mary Baker Eddy, the discoverer and founder of Christian Science, into French, Greek, and seven other languages, were announced.

Circulation of Christian Science periodicals and publications continued to rise during the year, and new advertising records for *The Christian Science Monitor* were announced.

WILL B. DAVIS,

Manager of Committees on Publication, The First Church of Christ, Scientist, Boston.

CHRISTMAS ISLAND. The name of two British islands, as follows:

(1) The largest atoll in the Pacific Ocean (area, 234 square miles, of which 94 square miles is land; pop., 127 in 1952), lying south of Hawaii, and a component, with Fanning and Washington, of the Gilbert and Ellice Islands Colony (see WESTERN PACIFIC ISLANDS, BRITISH). A copra plantation is worked by the government, using native labor, which is augmented seasonally from other Pacific islands.

(2) An integral part since 1900 of the colony of Singapore (q.v.), and administered by an officer of the Malayan civil service. Lying southeast of Java Head and 260 miles northeast of the Cocos (Keeling) Islands, in the Indian Ocean, it has an area of about 60 square miles and a population in mid-1954 of 1,929, including 1,435 Chinese, 396 Malaysians, 89 Europeans, and 9 Indians and Pakistanis. Lime deposits are worked by the British Phosphate Commission.

CHROMITE. The United States depends almost entirely upon imports of chromite because domestic production is small and of substandard quality. Most of the imports originate in remote sources; Cuba is the only producer of importance in the Western Hemisphere. Stimulated by government purchases, domestic production increased from 58,817 short tons in 1953 to 159,743 tons in 1954 (85,199 tons during the first 7 months of 1955). Imports of chromite, which increased from 1,203,852 tons in 1949 to 2,226,610 tons in 1953, declined to 1,312,561 tons in 1954.

Imports of 955,395 tons in the first 7 months of 1955 indicated a reversal of the downward trend. Consumption declined from 1,335,755 short tons in 1953 to only 913,973 tons in 1954, but substantial gains were made in 1955, reaching 844,566 tons during the first 7 months. The 1954 imports included 668,496 tons of metallurgical ore, 470,089 tons of refractory ore, and 173,976 tons of chemical grade ore.

Turkey is the chief source of metallurgical ore; Southern Rhodesia ranks a close second, and the Union of South Africa, third. More than 70% of the refractory ore originates in the Philippines, and the chemical grade ore comes from the Union of South Africa. These four countries produced 93% of the chromite ore imported into the United States in 1954. (See MINERAL PRODUCTION for output of major producing countries.)

CHRONOLOGY, 1955. A list of the important dates of 1955, and a Chronological Index of the more important events of the year, will be found at the front of the volume.

CHURCH MEMBERSHIP, U.S. Church membership in the continental United States was reported at 97,482,611 in 1954 by the *Yearbook of American Churches* (1955 edition)—an increase of 2,639,766, or 2.8%, over that of 1953. A total of 300,056 local churches was reported, compared with 294,359 in 1953.

Figures reported by 81 religious bodies with membership of 50,000 or more (representing about 98% of all membership) are shown in the accompanying table.

U.S. CHURCH MEMBERSHIP, 1954¹

¹ Mainly for the calendar year 1954, or a fiscal year ending in 1954. ² 1951. ³ 1953. ⁴ 1952. ⁵ 1950. ⁶ Not reported. ⁷ 1936. ⁸ 1946. ⁹ Includes bodies with less than 50,000 not listed in table. (Source: *Yearbook of American Churches*, 1955 ed.)

The church membership figure represented 60.3% of the population in 1954, as compared with 59.5% in 1953 and 47% in 1930. Of the 1954 total, 57,124,142 were Protestant; 32,403,332 were Roman Catholic; 5,500,000 were Jewish; 2,024,219 were Eastern Orthodox; 367,918 were Old Catholic and Polish National Catholic; and 63,000 were Buddhist.¹ (See also RELIGION.)

CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS.

It was reported at the April 1955 General Conference of the church that there were 219 stakes, with 1,993 wards and independent branches, 42 missions, and a total membership of 1,302,240. An extensive building program continued to go forward in Alaska, South America, the South Sea Islands, Europe, and the United States, with about 450 chapels under construction. Latest reports showed there were 4,272 missionaries in foreign fields and 6,826 in stakes. The church extended its missionary work and enlarged the operation of its educational system, which includes the Brigham Young University, Ricks College, the Juarez Stake schools, and 320 institutes

¹ Figures were gathered by the National Council of the Churches of Christ in the U.S.A. through questionnaires mailed to statistical officers of all known religious bodies. Roman Catholics count all baptized persons, including infants. Jews regard as members all Jews living in communities having congregations. The Eastern Orthodox churches count all persons in their nationality or cultural groups. Most Protestant bodies count only persons who have attained full membership. However, many Lutheran bodies and the Protestant Episcopal Church now report all baptized persons.

and seminaries. A new junior college was established in Hawaii.

The construction of the Los Angeles Temple neared completion, and plans were drawn for a new temple in New Zealand. The completed temple in Bern, Switzerland, was dedicated on Sept. 11, 1955, by President David O. McKay. The Salt Lake Tabernacle Choir, which toured Europe during August and September, furnished the music at the dedication and also gave concerts in 14 leading European cities. Ground was broken for the erection of the London Temple at New Chapel, London, England, Aug. 27, 1955; and a million-dollar administrative building for the Relief Society, a women's auxiliary, neared completion in Salt Lake City, Utah.

During July and August 1955, President Joseph Fielding Smith of the Quorum of the Twelve Apostles visited the Far East and created two missions, formerly covered by the Japanese Mission, in territory which includes Japan, Hong Kong, Okinawa, the Philippines, Korea, Guam, and Formosa. A new mission was also created in Australia from a division of the former Australian Mission.

The Church Genealogical Society microfilmed copies of genealogical records of five states and six foreign countries, equivalent to 75,691 printed volumes of approximately 300 pages each.

CIRCUSES AND RODEOS. *Circuses.*—With the exception of shows which played indoors under organizational auspices, circuses in the United States had a difficult time in 1955. Both large and small shows experienced spotty business, due to poor routing, shortage of help, and inadequate performances. Many smaller shows found it difficult to return to towns previously played, because of earlier unsatisfactory handling of the public. Several small new outfits were in the 1955 circus lineup, but some folded after a few weeks on the road, and the others had an unsatisfactory season.

The only large circus on the road, Ringling Bros.-Barnum & Bailey Combined Shows, traveling on 70 railroad cars, was plagued with internal dissension soon after its opening date, resulting in many major changes in personnel and in advertising policies. After successful stands in Madison Square Garden, New York City, and Boston, Mass., which produced grosses of \$2,000,000 and \$250,000, respectively, the show's business declined sharply, and was spotty throughout the rest of the country. Such cities as Chicago, San Francisco, and Los Angeles, usually very profitable stands, fell far below average. The show extended its season to Dec. 4, 1955, for the longest tour in its history, to try to recoup some of its earlier losses. The Clyde Beatty Circus, the only other railroad show, confined its playing strictly to the West and, after a spotty season, closed early in New Mexico.

Rodeos.—More than half of the country's 250 rodeos were played in connection with county and district fairs and provincial exhibitions. Generally they fared very well. Rodeos which were staged independently were less successful, lacking publicity and the prestige of the fairs.

The Calgary (Alberta) Stampede, best of the outdoor rodeos, drew half a million attendance

in five days. The two major indoor contest events in the United States—the World's Championship Rodeo at Madison Square Garden, New York, and the International Rodeo at International Auditorium, Chicago—drew large attendance chiefly because they had Roy Rogers and Gene Autry, respectively, as added attractions.

NAT GREEN,
Chicago Representative, "Radio-Television Daily"; Former Manager, Chicago Office, Ringling Brothers and Barnum and Bailey Combined Shows, Inc.

CITRUS FRUIT. See FRUITS.

CITY PLANNING. Sustained interest in metropolitan regional planning and in problems of local transportation; continued activity in urban renewal and central business district development; and port and industrial planning, in large part stimulated by the St. Lawrence Seaway project, were outstanding features of city planning in the United States and Canada during 1955.

Metropolitan Planning.—The continued expansion of development beyond the boundaries of central cities has produced serious problems relating to municipal services and facilities which are beyond the ability of suburban municipalities and unincorporated areas to plan and finance. The rapid growth of unincorporated urbanized areas has thus accentuated the urgent need for comprehensive metropolitan planning. In Baltimore, Milwaukee, Savannah, and other cities, new or revived metropolitan planning activity has been undertaken. In Canada, stimulated by the example of the metropolitan government in the Toronto area, official studies of metropolitan organization are being carried on in Vancouver, Edmonton, Winnipeg, and elsewhere. Under the Housing Act of 1954, Detroit, Atlanta, and Little Rock have received federal aid for metropolitan planning.

Local Transportation.—Problems of local transportation planning are becoming increasingly urgent. Expressway systems are producing basic changes in city patterns, and mass transit facilities

are faced with more rapid declines in patronage. New and extended rapid transit systems, of both conventional and newer types, are being planned. Cleveland opened a rapid transit line in 1955, but early results were disappointing, mainly because the line was not yet integrated into a complete system.

Meanwhile, automobile use continues to increase rapidly in nearly all cities, and focuses attention upon development of parking facilities and measures for relief of traffic congestion. Comprehensive studies of metropolitan transportation requirements are nearing completion in Detroit and Philadelphia, and are about to begin in New York and Chicago. In the largest urban areas, it is generally agreed that modern mass transit systems are essential but cannot be made self-supporting. (See also URBAN TRANSIT.)

Urban Renewal.—The renewal of older sections of cities, including both redevelopment of blighted areas and conservation of middle-aged areas, continues, stimulated by the federal Housing Act of 1954. Large areas of New York, Chicago, Detroit, and other cities are being redeveloped. Federal legislation has proved to be a significant stimulus. In spite of such activity, however, the sustained demand for housing and commercial construction on the outskirts of cities and in central business districts has increased the difficulties of renewal in other parts of cities.

Central Business Districts.—Central business districts of many large cities continue to attract new development. In New York, a midtown skyscraper boom is continuing. Chicago's Loop area saw completion of two skyscraper office buildings and ten large parking garages. Philadelphia's Penn Center greatly expands that city's downtown business district. Detroit, New Orleans, and other cities are building new downtown civic centers. (See also ARCHITECTURE.)

Recent studies show that central shopping continues in a healthy condition in spite of suburban developments. Although use of mass transit is declining in central business districts, automobile riding is increasing proportionately, putting greater emphasis on offstreet parking facilities

Architect's drawing of Fort Dearborn Project, superimposed on aerial photograph of downtown Chicago.

SKIDMORE, OWINGS & MERRILL, ARCHITECTS

and measures for the relief of traffic congestion.

Among central business district developments for which plans have been recently announced or on which construction has begun are: large air-rights developments over both Grand Central and Pennsylvania terminals in New York, and several other major new office buildings in the midtown area; a convention hall and two office buildings in Chicago, as well as the large Fort Dearborn project for a civic center and commercial development on the Near North Side; a very large hotel in downtown Montreal; completion of the Penn Center office and hotel project in Philadelphia; and new central district transit facilities in New York, San Francisco, Los Angeles, and Cleveland.

St. Lawrence Seaway.—As a consequence of the building of the St. Lawrence Seaway project (see CANALS), the major Great Lakes cities have all been actively planning port and industrial developments related to the seaway. In Chicago, plans were completed and construction begun on the first stage of a comprehensive port-industrial project ultimately to occupy 2,300 acres of Lake Calumet in the southern part of the city. Milwaukee is planning expansion of its municipal Lake Michigan terminals. Detroit, Toledo, Cleveland, and Buffalo have each completed studies of potential seaway traffic and are planning new waterfront terminals. Toronto recently opened the first of a series of modern marine terminals. Smaller cities, including Muskegon, Waukegan, Michigan City, Ashland, and Oswego, are actively conducting preliminary studies of possible port and industrial developments.

Four Canadian towns on the north side of the St. Lawrence River are to be built, relocating the residents, businesses, and facilities of eight existing towns. The latter will be partially or completely flooded by the water to be backed up by the Barnhart Island and Iroquois dams now under construction.

HAROLD M. MAYER,

Department of Geography, The University of Chicago; Former Director of Research, Chicago Plan Commission.

CIVIL AERONAUTICS ADMINISTRATION. Commercial aviation, with which the CAA is in part concerned, experienced a continuing steady growth in practically all categories during the 1955 fiscal year. Revenue passenger-miles flown by domestic scheduled carriers showed a 17% increase from the 15.6 billion miles in the fiscal year 1954 to 18.3 billion in 1955. Revenue passenger-miles flown by international scheduled carriers for the same period increased from 3.5 billion to 4.1 billion, or 17%. (See also AERONAUTICS.)

Under the Federal-Aid Airport Program, in the fiscal year ending June 30, 1955, allocations granted to 192 high-priority airport projects amounted to \$22,245,281. For the fiscal year ending June 30, 1956, \$62.5 million was made available, with 205 grants amounting to \$20 million already programmed. A recent amendment to the Federal Airport Act provides \$63 million for aid in each of the next three fiscal years.

During the fiscal year 1955, the length of VOR (very high frequency omnirange) airways was increased to 74,000 miles of primary and 25,000 miles of alternate airways. The number of VOR's was increased by 27, bringing the total to 410. The DME (distance measuring equipment)

system grew to number 231 ground stations. Ten instrument landing systems and 5 airport surveillance radars were installed, while a long-range surveillance radar commissioned at New York covers a radius of about 100 miles.

The increased use of direct radio communications between pilots and controller personnel in air route traffic control centers, and of radar as a traffic control tool, further expedited the handling of arriving and departing aircraft. Two additional military/civil radar approach control centers were commissioned, making a total of three in a program of 18.

Studies of the problems connected with the use of new-type aircraft now in service and proposed for the near future continued as the first turboprop-powered aircraft to be used in United States scheduled service, the Vickers Viscount, began flights between Washington and Chicago and between Washington and Norfolk. New, larger, and faster aircraft, such as the Douglas DC-7 and the Lockheed Super Constellation, were delivered, replacing older equipment. In the fiscal year 1955, civil aircraft manufacturers shipped 4,232 aircraft valued at \$267,972,000.

Because of continued increases in aviation activities, proposals were developed to place more responsibility for safety on the aviation industry and operators. A report containing the proposals was under consideration by industry groups and trade associations in 1955.

An important legal decision in the Cedarhurst case upheld the validity of government regulations on the basis that Congress pre-empted control of air space necessary for the flight of aircraft. The decision voided an ordinance of the village of Cedarhurst, N.Y., restricting low-altitude approaches to New York International Airport, as being in conflict with the paramount federal authority to regulate minimum flight altitudes.

The dynamic air traffic control simulator at the CAA Technical Development and Evaluation Center in Indianapolis was used to develop an improved air traffic control system for the Chicago area, preparatory to placing the second civil airport in operation. Using radar techniques, the system will permit a large increase in air traffic flow for the area.

The center's analyzer for determining the effectiveness of an aircraft fire-extinguishing system in flight was applied to the B-36 airplane with satisfactory results. Facilities were erected at the center for the conduct of full-scale fire tests on helicopters and for the investigation of explosion hazards associated with jet engine installations.

Evaluation tests were conducted on military radars between Boston and Norfolk to determine the feasibility of using some of the existing network of military equipment in conjunction with some civil radar in civil air traffic control. Present plans call for the first all-radar airway between these two points. From operation of this airway, the CAA expects to learn much that will be useful as radar coverage is expanded across the country.

A basis for evaluation of collision prevention devices was developed at the center. Two DC-3 airplanes (normally equipped and painted) were flown at each other in more than 140 tests to measure pilot reaction under simulated daytime collision conditions. Similar tests with devices installed for improving aircraft conspicuity and proximity warnings will produce the evaluation results.

During the year the CAA was authorized to

purchase airways aids for eight countries in Europe, the Near East, and Asia, under the Foreign Operations Administration (now International Cooperation Administration) program. This equipment will further the standardization of a common air navigation system for worldwide use. Twenty FOA/CAA missions and groups were in operation or being planned in 19 countries to give technical advice and assistance.

CIVIL LIBERTIES. Two specific events and a "tendency" made 1955 a particularly significant year in the history of American civil liberties. The events were court decisions—one, a pronouncement by the U.S. Supreme Court laying down a pattern for enforcement of racial desegregation in the public schools of the United States (*Brown v. Board of Education of Topeka*, 75 S.Ct. 753); the second, a decision by an U.S. Court of Appeals, denying the secretary of state arbitrary power to withhold passports from Americans who wish to travel abroad (*Schachtman v. Dulles*, 23 *United States Law Week* 2665). The "tendency" was a marked relaxing of tension over problems of internal security and a disposition to re-examine methods employed in the recent past to combat the threat of subversion.

Segregation.—The Supreme Court had announced its decision on May 17, 1954, that racial segregation violated the 14th Amendment of the Constitution, but had postponed a decree giving that holding effect. In its pronouncement of May 31, 1955, the court solved the problem of implementing the fundamental principle by remanding the cases to the local courts in the districts where they had originated and instructing those courts to shape the various enforcement decrees in the light of local conditions. In fashioning the decrees, said the Supreme Court, the local courts "will be guided by equitable principles" which have been traditionally characterized by "practical flexibility" of remedy "and by a facility for adjusting and reconciling public and private needs." However, the Supreme Court made it clear that local court discretion was sharply limited by the mandate of the amendment. The establishment of unsegregated schools must take place "as soon as practicable," and the burden of proving that a delay is necessary for practical reasons must rest on the school districts themselves. Local feeling against a desegregation policy is not to be considered a valid ground for postponing its inauguration.

National reaction to the court's policy was variable, but it is probably a fair generalization to say that two broad patterns were emerging in the South: more or less willing compliance in the fringe areas where racial feeling was not so intense; and determined opposition in the deep South where a policy of segregation is very deeply rooted. (See also EDUCATION; NEGROES, AMERICAN.)

The Passport Decision.—For many years government attorneys have insisted that the granting or withholding of a passport is entirely a matter of executive discretion. But on June 23, 1955, the Court of Appeals for the District of Columbia

held that this was not the case, and that the refusal of a passport (which, of course, prevents the person involved from traveling abroad) is subject to judicial review on the question of whether due process of law has been granted. Said the court:

The right to travel, to go from place to place as the means of transportation permit, is a natural right subject to the rights of others and to reasonable regulation under law.

In this case, the secretary of state was assumed to have acted arbitrarily in denying a passport, since he had not answered the appellant's arguments in his own behalf. Just what procedural forms the secretary would have to comply with in order to meet the 5th Amendment's due process demands was not decided. But if the principle of the decision survives future court tests, it must be regarded as an important milestone in modern history of civil freedom.

Reconsideration of the Loyalty Problem.—Surely the most important development in 1955 was the tendency to take a long second look at the attitudes and measures which had been engendered by the subversion issue during recent years. Such broad alterations of viewpoint are almost impossible to evaluate with complete accuracy, but no observer could deny that the temper of officialdom had changed since the preceding year, and many evidently felt that the climate of popular opinion had also shifted.

One of the most dramatic manifestations of this different spirit toward civil liberties was the sharp decline in the political influence of Sen. Joseph R. McCarthy of Wisconsin. It would be hazardous to try to estimate the exact extent of his loss of popular support, but the fact beyond dispute was that both the leaders of his own party and the newspapers of the nation were paying far less attention to him than they had in 1954.

Meanwhile, a number of more specific straws in the wind could be identified. Subcommittees of the Senate committees on Government Operations and on Post Office and Civil Service began to inquire into past dismissals of federal employees for security reasons. Democratic Party threats to extend the range of these inquiries led to passage of an act which established a bipartisan 12-member commission to review the government's loyalty-security program for public employees and defense workers. The law, which vests power to appoint the commission in the president, the president of the Senate, and the speaker of the House, was signed by President Eisenhower on August 9.

Perhaps even more significant was the fact that in several well-publicized cases high administration officials reversed security decisions and apologized to the individuals who had been adversely affected by them. Eugene Landy, who had at first been denied a Naval Reserve commission in the U.S. Merchant Marine because of allegations against his mother, was granted his commission by order of Secretary of the Navy Charles S. Thomas. Wilber M. Brucker, secretary of the army, publicly apologized to Alfred P. Kelly of Wayne University, who had been incorrectly identified as pro-Communist by U.S. Army security officers. Wolf I. Ladejinsky, who had earlier been ruled a security risk by Secretary of Agriculture Ezra T. Benson, was hired for sensitive work by the International Cooperation Administration and later received Secretary Benson's

assurance that the adverse ruling had been cancelled and the whole matter expunged from the records.

Finally, the Supreme Court wrote a judicial footnote to the story of the employee-security question when it held that the Loyalty Review Board of the Civil Service Commission had exceeded its authority in holding that Dr. John P. Peters was a security risk (*Peters v. Hobby*, 23 *United States Law Week* 4311). The court's decision did not reach the constitutional issues Dr. Peters had raised, but its effect was to overturn the adverse judgment and thus to add one more to the lengthening list of such reversals in 1955.

(See also the Index entry, *Civil Liberties*.)

ROBERT G. McCLOSKEY,
Associate Professor of Government,
Harvard University.

CIVIL SERVICE, U.S. On June 30, 1955, there were 2,397,000 civilian employees in the federal government, a decrease of 10,000 since June 30, 1954. They were located as follows: 214,000 outside, and 2,183,000 within, the continental United States, including 232,000 in the Washington (D.C.) metropolitan area. The Department of Defense employed 50%; the Post Office Department, 21%; the Veterans Administration, 7%; and all other agencies, 22% of the total. Eighty-four per cent of all employees and 90% of those in the continental United States were in the competitive civil service.

During 1955, the Civil Service Commission, central personnel agency of the federal government, replaced a large number of professional entrance-level examinations with a single Federal-Service Entrance Examination open to college graduates regardless of their academic major. This new examination is expected to increase the yearly intake of recent college graduates.

A new "career-conditional" appointment system, designed to strengthen the career service, became effective Jan. 23, 1955, under Executive Order 10577 of Nov. 22, 1954. Indefinites on the rolls on January 23 who were appointed from civil-service eligible lists were converted to the new type of appointments. An act of Aug. 12, 1955, gave the new type of appointments to additional incumbents with at least three years of satisfactory service who pass qualifying examinations. A feature of the new system is that employees must complete three years of service before they are advanced to full career tenure, thereby demonstrating their competence for and interest in federal service, as well as the government's continuing need for their services.

In order to attract well-qualified applicants in shortage categories, the commission raised entrance salaries for certain grades in such fields as engineering, physical science, veterinary science, and medicine.

The commission also removed maximum age limits for civil-service examinations as provided by the Independent Offices Appropriation Act, 1956.

By agreement between federal agencies concerned and the commission, action was begun to bring approximately 35,000 federal positions in Alaska, Guam, and foreign countries under the competitive civil service. By September 1955 this action had been completed on 10,000 of the jobs in Alaska.

An act of June 28, 1955, increased by approximately 7½% the salaries of federal employees paid under the Classification Act, as well as of certain other executive, legislative, and judicial

branch employees. The \$14,800-a-year ceiling was maintained.

An act of June 10, 1955, increased the pay of employees of the postal field service about 8.1% by raising salary rates and classifying positions to place them in proper relation according to duties and responsibilities.

An act of July 28, 1955, increased maximum per diem rates for employees in travel status from \$9 to \$12, and mileage rates from 7 to 10 cents a mile for automobiles. Lower rates can be paid.

Civil-service annuitants received increases under an act of Aug. 11, 1955. Annuitants who retired before July 1, 1955, received increases of 12% on the first \$1,500 of yearly annuity and 8% on any excess, but no increase was provided for any annuity over \$4,104 a year.

PHILIP YOUNG,
Chairman, U.S. Civil Service Commission.

CLAUDEL, Paul-Louis-Charles-Marie, French author and diplomat: b. Villeneuve-sur-Fère-en-Tardenois, France, Aug. 6, 1868; d. Paris, France, Feb. 23, 1955. A distinguished diplomat whose many posts included the ambassadorship to the United States (1927-32), Paul Claudel has also been termed one of the most creative poet-playwrights of the 20th century.

He was educated at the Lycée Louis-le-Grande, and began his diplomatic career in 1893 as assistant consul in New York, following which he served at various diplomatic posts in the Far East (1894-1909), including Shanghai, Foochow, Tientsin, and Peking. Returning to Europe, he was appointed consul at Prague in 1910, and in the following year, consul-general at Frankfurt,

Paul Claudel
(d. Feb. 23, 1955)

FRENCH EMBASSY PRESS
AND INFORMATION SERVICE

Germany. In 1913 he was transferred to Hamburg. With his expulsion from German territory at the outbreak of World War I, he was appointed chargé d'affaires at Rome (1915-16); and at the end of the war he served with his government's economic mission to the United States. In 1917 he was promoted to the rank of minister and sent to Rio de Janeiro where he remained until 1920. After a brief period in Copenhagen, Claudel was appointed ambassador to Japan in 1921. He attained the peak of his diplomatic career in 1927-33 when he served as ambassador to Washington. From 1933 to 1935 he was ambassador to Brussels, retiring in the latter year to devote his full time to literature. He was elected to l'Académie Française in April 1946.

Paul Claudel's career as a writer was prolific and varied. Besides numerous poetic dramas, he wrote several volumes of poetry, travel literature, and literary and religious criticism, and translated Aeschylus' trilogy, the *Oresteia*. Paradoxically, he rediscovered Catholicism (1886) after

reading Rimbaud's *Illuminations*, and from then until his death he incorporated in his works the intensity and mystical nature of his religious beliefs.

Claudél's poetry, inspired by his Catholic faith, is lyrical and cosmic in its emotional and intellectual proportions. The poetry that best reflects his mysticism and reveals the lyrical grandness of his style has been published in *Cinq grandes odes* (1910) and *La cantate à trois voix* (1913). Other poetic volumes of a style more familiar in character include *Corona benignitatis anni Dei* (1915) and *La messe là-bas* (1919).

Attracted by the theater early in his career, Claudél developed a dramatic form whose style and spirit suggests a kinship with the religious theater of the Middle Ages. Difficult to perform because of their extraordinary length and their complex and often unorthodox structure, his plays are nevertheless capable of evoking an intense and positive response. Among them are *L'Échange*, written in 1893 (1901); *Partage de midi* (1906), considered his masterpiece; *L'Otage* (1911), the best known and least difficult to perform; *L'Annonce faite à Marie* (1912), originally written as *La jeune fille Violaine*; *Le soulier de satin*, written in 1919-24 (1929), the longest and most complex; *Le livre de Christophe-Colomb* (1930), the music of which was composed by Darius Milhaud; and *Jeanne au Bûcher* (1939).

Admired no less as a writer of prose, Claudél was the author of several works on the Far East, including *Un coup d'oeil sur l'âme japonaise* (1923) and *L'Oiseau noir dans le soleil levant* (1929). His works of criticism include *Positions et propositions, I-II* (1928-34) and *Contacts et circonstances* (1940). From his retirement in 1935 until his death he devoted most of his time to the study of the Bible, rejecting the modern radical criticism in favor of the traditional medieval interpretations. Prominent among his works of religious criticism are *Toi, qui es-tu?* (1936); *Un poète regarde la croix* (1938); *Introduction au livre de Ruth* (1938); *Introduction à l'Apocalypse* (1946); and *Le livre de Job* (1946). His more recent prose includes *Sous le signe du dragon* (1948); *Correspondance avec André Gide* (1949); and *Emmatis* (1950).

CLAY. Total clay of domestic origin, sold or used by producers in the United States (as reported to the U.S. Bureau of Mines), declined from 42,435,964 short tons (valued at \$125,202,672) in 1953 to 41,025,000 tons (valued at \$118,750,000) in 1954. The 1954 totals included 8,900,000 tons of fire clay, 1,875,000 tons of kaolin, 1,275,000 tons of bentonite, 400,000 tons of fuller's earth, 325,000 tons of ball clay, and 28,250,000 tons of miscellaneous clays. Clay imports increased from 149,111 tons in 1953 to 165,000 tons in 1954, and exports also increased from 302,388 tons in 1953 to 370,000 tons in 1954. (See also CERAMICS.)

CLEVELAND. Largest city in Ohio and seventh-ranking city of the United States in population, Cleveland is the center of one of the most rapidly growing industrial districts in the nation. The estimated population of the city proper (73.43 square miles) was 950,000 in 1955 (1950 census, 914,808), while Greater Cleveland (Cuyahoga County) had a population of 1,600,000, with a growth of more than 3% for the year.

Mayor Anthony J. Celebrezze, Independent Democrat, was assured of a second term when he received 55% of the total votes cast for five

candidates at the city's primaries on Oct. 4, 1955. The City Council of 33 members continued to be largely Democratic.

Budget appropriations for 1955 totaled \$113,429,552.28; the city tax rate (1955), \$15.60 per \$1,000 of assessed valuation (\$2,387,744,450); and the overall net tax rate of city, county, and schools, \$32.10. The overall net city debt (Oct. 1, 1955) was \$185,738,500, and the net tax-supported debt (Jan. 1, 1956) was estimated at \$101,000,000. Of the ten largest cities in the United States, Cleveland has the lowest tax rate. Greater Cleveland school enrollment (public, parochial, and private) in October 1955 was 312,232; college and university enrollment, 26,056.

The district of northeastern Ohio, of which Cleveland is the metropolis, is developing rapidly in the categories of steel, chemicals, automotive products, titanium, petroleum, and machine tools. Of the 3,500 classifications of product manufacturers in the country, two thirds are represented in this area. Industrial expansion in Cleveland involved the expenditure of \$131 million in 1954; and in 1955, three companies announced expansions totaling \$170 million for the immediate future. In 1955 metropolitan Cleveland was achieving an all-time high for contracts awarded for future construction. Totals for the first seven months included \$103,303,000 for nonresidential and \$167,363,000 for residential buildings. Total employment in Greater Cleveland on Oct. 1, 1955, was 655,600; unemployment, 18,000; and average weekly earnings of production workers, \$90.40.

Among the many evidences of business progress in 1954-55 were: the building of a central bridge across the Cuyahoga Valley; the final planning of a 22-story office building for the Public Square (estimated cost, \$17 million); a \$9 million Parcel Post Annex; progress in urban renewal, with large sums expended in community planning and development; completion of the City Hospital's Research Laboratory, one of the most complete of its kind in the nation; \$8 million worth of improvements in the airport terminal; the opening of three major suburban shopping centers; the building of a \$3,500,000 Cuyahoga County administration building; and modernization of the Great Lakes fleets.

The Ohio Turnpike (see OHIO) opened in 1955, and connects with Cleveland through several interchanges. A rapid transit system from the Union Terminal on the Public Square, to east and west over a route of 13 miles, was completed in 1955 at a cost of approximately \$30 million. Expansions of the system were being studied.

WILLIAM GANSON ROSE,
Public Relations Counsel; Author, "Cleveland
—The Making of a City."

CLIMATE. See METEOROLOGY.

CLOTHING INDUSTRY. Practically all branches of the apparel trades made encouraging volume gains during the first half of 1955. This followed a year in which women's wear, as a whole, showed improvement while men's wear sales dropped.

Net shipments of women's, misses' and juniors' outerwear in 1954 amounted to \$2,921 million, compared with \$2,743 million in 1953. A breakdown of items (in millions of dollars, with 1953 figures in parentheses) is as follows: unit-price dresses, \$1.175 (\$1.081); dozen-price dresses, \$353 (\$354); coats and suits, \$865 (\$810); blouses, \$327 (\$310); skirts, \$201 (\$188).

The value of total net shipments of these merchandise types for the first six months of 1955 was \$1,531 million, compared with \$1,432 mil-

lion for the same period of 1954. A breakdown of items for the first half of 1955 (in millions of dollars, with the corresponding 1954 figures in parentheses) is as follows: unit-price dresses, \$702 (\$636); dozen-price dresses, \$202 (\$194); coats and suits, \$353 (\$365); blouses, \$168 (\$151); skirts, \$106 (\$86).

Production for 1954 (in thousands of units, with 1953 figures in parentheses) was: unit-price dresses, 138,100 (135,774); dozen-price dresses, 110,676 (111,264); coats, 25,679 (23,762); suits, 14,143 (14,087); blouses, 168,132 (152,460); skirts, 72,420 (71,160).

Production for the first six months of 1955, compared with the corresponding period of 1954 (in thousands of units, with 1954 figures in parentheses) was: unit-price dresses, 83,807 (79,374); dozen-price dresses, 67,908 (59,460); coats, 11,065 (11,792); suits, 8,077 (7,449); blouses, 94,884 (86,496); skirts, 40,920 (35,916).

In the first seven months of 1955, 3.2% more units were produced in the dress market than in the same period of 1954, but dollar value rose 8.1%. This reflected a relatively stronger demand for higher-priced than for lower-end goods. Somewhat similar trading-up was evidenced in dozen-price dresses.

Production of men's apparel in 1954 (in thousands of units, with 1953 figures in parentheses) was as follows: suits, 19,301 (21,774); overcoats and topcoats, 4,245 (5,656); separate dress and sport trousers, 56,112 (52,576).

Output for the first six months of 1955 (in thousands of units, with figures for the same period of 1954 in parentheses) was: suits, 11,126 (10,001); overcoats and topcoats, 2,337 (2,051); trousers, 33,300 (29,204).

Manufacturers' shipments of children's and infants' outerwear in 1953 amounted to \$621 million, compared with \$575 million in 1952.

New York City ranks first among the major United States markets in all apparel categories. A 1952 analysis shows the following percentage breakdown for manufacturers' sales of leading merchandise types in the five largest production centers:

	Women's dresses ¹	Women's coats and suits ²	Men's tailored clothing ³	Men's furnishings and work clothing ⁴
New York.....	65.8	71.7	37.7	36.0
Los Angeles.....	5.7	5.4	...	3.3
Philadelphia.....	4.4	...	9.6	3.1
Chicago.....	4.3	3.1	8.1	4.0
Boston.....	2.4	4.4	...	...

¹ Preliminary 1953 results, based on the results of almost 30% of the dress manufacturers accounting for 30% of total trade volume, show sales 10% higher than for 1952. ² Kansas City, with 2.2% of coat and suit sales, ranks fifth. Preliminary 1953 results, based on more than 30% of the trade's firms and sales, show coat and suit volume 8% ahead of 1952.

³ Baltimore, with 7.2% of men's tailored clothing volume, ranks fourth. Preliminary 1953 results, based on about 500 men's clothing firms, indicate sales 9% up from 1952.

⁴ Nashville, with 2.8% of men's furnishings and work clothing sales, ranks fifth.

The apparel industry ranked eleventh in value of sales in 1954, the same as in 1953 and a notch behind the 1952 standing. Preliminary volume for 1954 was \$10,621,000,000, one half of 1% higher than for 1953.

Canada.—The total estimated value of Canadian-made clothing in 1954 was \$638,932,000, as compared with \$697,189,000 in 1953. Preliminary figures for the three major merchandise categories (in thousands of dollars, with 1953 figures in parentheses) are: men's apparel, \$229,561 (\$273,946); women's apparel, \$217,-

702 (\$220,410); children's wear, \$44,245 (\$45,348).

SAMUEL FEINBERG,
Columnist, "Women's Wear Daily."

COAL. The world output of coal reached 1,959 million metric tons in 1953 and 1,952 million tons in 1954. (See MINERAL PRODUCTION for output of major countries.)

United States.—Coal production has been reported as follows (in thousands of short tons):

Year	Anthracite	Bituminous	Total	Change (per cent)
1948.....	57,140	599,518	656,658	-4.5
1949.....	42,702	437,868	480,570	-26.8
1950.....	44,077	516,311	560,388	+16.6
1951.....	42,670	533,665	576,335	+2.8

¹ Preliminary. ² January 1 through the week ending November 12. (Source: U.S. Bureau of Mines.)

The decline in bituminous coal production, which characterized three successive years until the end of 1954, was reversed by a strong increase in output during 1955. The expanded production, compared with 1954, began in January 1955 and by October had been maintained or increased during each succeeding month. The gain up to October 15 was 20%, compared with the like period of 1954. The increase was due primarily to strong industrial activity, which was supplemented by an expansion in export trade, particularly overseas shipments.

Anthracite production, which suffered a 23% decline in 1953 compared with 1952, receded moderately in 1954; and, according to preliminary estimates, in 1955 dropped 4% below the 1954 level.

Canada.—Coal production of 15,900,000 short tons in 1953 declined to 14,906,000 tons in 1954, and reached 9,814,481 tons during the first 9 months of 1955.

Germany.—Production of bituminous and anthracite coal in West Germany increased from 125,653,000 metric tons in 1953 to 129,032,000 tons in 1954 (86,829,000 tons during the first 8 months of 1955). Corresponding figures for lignite were: 84,690,000, 87,811,000, and 57,808,000. East German production of bituminous and anthracite coal was 3,148,000 metric tons, and of lignite, 178,266,000 tons in 1954.

United Kingdom.—Coal production was 227,801,000 metric tons in 1953; 227,649,000 tons in 1954; and 143,374,000 tons during the first 8 months of 1955.

(See also EUROPEAN COAL AND STEEL COMMUNITY; MINING.)

OLIVER BOWLES, *Former Chief, Nonmetals Division, U.S. Bureau of Mines;* and
BERENICE B. MITCHELL, *Foreign Minerals Staff, U.S. Bureau of Mines.*

COAST AND GEODETIC SURVEY, U.S. Increasing emphasis on aviation and national preparedness was a special factor influencing operations of this bureau in 1955. New charts for the aviation industry and surveying operations in Alaska were given first priority in carrying out the work program for the year.

Geodetic Surveys.—Of special significance in the United States was the extension of horizontal control into the offshore area along the coast of Louisiana. Geographic positions and related mapping data were collected for use by government agencies, states, and private organizations in locating well drillings and lease blocks. Primary horizontal control was extended into the interior of Alaska. Gravimetric measurements were made in many areas of the United States, and an inter-continental connection was made between New York and Rome, Italy, transporting gravimeters by air.

Hydrographic Surveys.—Seventeen ships and two shore-based parties operated along the United States coasts and in Alaska, using modern navigational and electronic equipment. Major Alaskan surveys were concentrated in the Aleutian Islands, Alaska Peninsula, and other areas. New surveys were begun in the Gulf of Maine in a region under study in the fisheries program. Hydrographic surveys controlled by electronic methods were extended over 500 miles offshore.

Tides and Currents Surveys.—Observations and investigations of tides and currents along the United States coasts were continued to provide basic data for the prediction of tides and currents in support of maritime commerce and for engineering projects important to the commercial and industrial development of coastal areas. Six volumes of annual tide and current tables were published. Data obtained on temperature and density of sea water at tide stations are published in four volumes, one of which is revised annually.

Photogrammetric Surveys.—Changes in the topography of coastlines caused by forces of nature and the rapid industrial and cultural development of the nation were mapped from aerial photography for the revision of charts. The program includes both the preparation of large-scale original maps and the revision of existing maps. This information is used extensively for local planning and engineering purposes, and for settlement of property boundaries involving coastal areas.

Geophysics.—The magnetic survey of the United States and Alaska was continued, with observations at 26 new stations and seven repeat stations supplementing results from seven magnetic observatories. The new observatory and laboratory near Fredericksburg, Va., was completed, and some of the new instruments were in operation by the end of the year. A new series of world magnetic charts for the 1955 epoch was compiled and published as a joint undertaking with the Navy Hydrographic Office.

Seismological services included prompt location of 1,153 earthquakes. One new and eight old stations were operated, and close cooperation was maintained with 15 others.

Charts.—Production of charts rose to over 45 million copies. Nautical charts on issue increased to 808 at the end of the year. The program of reconstructing and modernizing nautical charts was continued. Aeronautical charts increased by 80 for a total of 1,550. Nine new route charts were published to replace the old series of area charts. A new chart covering the Pacific air routes from Seattle to the Orient was added to the series of aircraft position charts. Acetate drawings were introduced to replace opaque material for chart revision at a substantial annual saving. A new-type transfer ink developed by the bureau for indicating revisions on acetate drawings simplified negative preparation for reproductions.

Research and Development.—An experimental pressure tide gage was designed, utilizing light rays as a pressure-sensing device instead of the mechanical arrangement originally used. The geodimeter was used successfully in observing over extensive water areas in making island connections with the mainland. An improved method was developed for pointing and focusing this new electronic distance-measuring device. Special tent poles were designed from magnesium tubing for use by field parties supplied by airlift.

H. ARNOLD KARO,
Rear Admiral, USCGS; Director, U.S. Coast
and Geodetic Survey.

COAST GUARD, U.S. Operations of the U.S. Coast Guard in the fiscal year 1955 were directed primarily toward carrying out its traditional peacetime mission: the maintenance of safety and order on the high seas and navigable waters of the United States. Diminished requirements for search and rescue facilities, for ocean weather station coverage in the Pacific Ocean, and for port security facilities in the United States resulted in the inactivation of 4 cutters in addition to the 12 previously deactivated. Available funds were reduced from \$226,870,872 to \$208,705,170. Military personnel strength was at 28,500, approximately the same level as the preceding year, while authorized civilian personnel totaled 5,314, as compared with 5,128 during the previous year.

Throughout 1955 the Coast Guard continued to carry out its regular duties of maritime law enforcement; promotion of safety and efficiency in the merchant marine; inspection of merchant vessels and enforcement of regulations for motorboats; operation of aids to navigation, including lighthouses, buoys, and electronic signals; the protection of life and property at sea; rescue and aid of persons, vessels, and aircraft in distress; operation of ocean stations and the International Ice Patrol; and maintenance of a state of military preparedness.

The volume of law-enforcement activity during the year was as follows: vessels and motorboats boarded, 83,323; reports of violations of the Motorboat Act, 6,166; reports of violations of port security regulations, 2,695; permits to load or discharge explosives, 1,473; tonnage of explosives covered by permits, 363,194; explosive loadings supervised, 1,469; regattas patrolled, 801; merchant mariners' documents issued bearing evidence of security clearance, 18,826; waterfront workers screened for security, 30,668; and total rejected as poor security risks, 52.

The Coast Guard also helped to enforce the Oil Pollution Act, anchorage regulations, and laws relating to internal revenue, customs, immigration, quarantine, and the conservation and protection of wildlife and fisheries.

Facilities used in assistance operations included a system of 143 lifeboat stations, together with communications centers, bases, vessels, and aircraft at strategic points along the coasts and inland waterways. Assistance rendered during the year included 19,045 assistance calls responded to; 3,242 lives saved or persons rescued from peril; and 1,215 vessels refloated.

During the year, 2,483 marine casualties were reported, of which 1,938 cases were considered closed. No inspected and certified American passenger vessel was involved in a serious accident, but marine casualties claimed 4 lives.

The Coast Guard completed 5,743 inspections of merchant vessels with a gross tonnage of 17,583,700; made drydock examinations of 4,538 vessels, with a total tonnage of 16,794,052; carried out 19,283 miscellaneous inspections; numbered 358,411 undocumented vessels; and reviewed plans for 11,728 merchant vessels.

A total of 38,389 aids to navigation was maintained in the United States and its territories and possessions, in the Trust Territory of the Pacific Islands, and at overseas military bases. These aids included 49 loran stations, 378 manned light stations, and 53 lightships.

The Coast Guard's larger ships consisted of 178 cutters and buoy tenders of various types. Fixed and rotary-wing aircraft in operation numbered 126. Coast Guard reserve strength com-

prised 3,499 officers and 20,492 enlisted personnel.

The Coast Guard Auxiliary, a nonmilitary organization of volunteers, was active in 328 communities in the promotion of safety and efficiency in the operation of small boats. Its 12,747 members examined 25,245 motorboats, patrolled 297 regattas, and answered 2,535 calls for assistance.

A. C. RICHMOND,
Vice Admiral, USCG, Commandant.

COBALT. World production of cobalt established a new high of 14,500 short tons in 1954, a gain of 7% over 1953. A new plant of the International Nickel Company at Port Colborne, Ontario, began production in October 1954. Production increased substantially in Northern Rhodesia and the Belgian Congo. United States production increased from 1,251,160 pounds in 1953 to 1,990,677 pounds in 1954.

United States production of cobalt metal from domestic and imported ores declined to 2,805,258 pounds (cobalt content) in 1954, a loss of 0.5% from 1953. It reached 1,888,256 pounds in the first 7 months of 1955. The cobalt content of other compounds (oxide, hydrate, and others) dropped to 1,210,660 pounds in 1954 (1,401,036 pounds in 1953). It reached 978,337 pounds in the first 7 months of 1955.

The 4-year upward trend in imports of cobalt into the United States was reversed in 1954 when imports amounted to 16,871,000 pounds (cobalt content), a decline of 2% from the record year 1953. Imports in 1954 comprised 14,227,754 pounds of metal and cobalt content in other forms as follows: oxide, 318,000 pounds; white alloy, 2,360,551 pounds; ore, 3,349 pounds; and salts and compounds, 74,000 pounds. Imports were recorded from Northern Rhodesia for the first time. Consumption of cobalt in the United States in 1954 was 7,350,000 pounds, a decline of 32% from 1953. The decline is due primarily to a lesser use of cobalt in various alloys. (See MINERAL PRODUCTION for output of major producing countries.)

COCOA. World cocoa (cacao bean) production in the 1955-56 crop year was forecast at 1,784 million pounds, compared with 1,745 million pounds in 1954-55 and 1,603 million pounds in 1953-54. The output of the leading producers was as follows (in millions of pounds):

	1953-54	Preliminary 1954-55	Forecast 1955-56
Gold Coast ¹	483 ²	512 ²	512
Brazil.....	271	372	348
Nigeria ³	218	182	202
Ivory Coast.....	117 ²	145 ²	145
French Cameroons.....	125	128	141
Dominican Republic.....	66	84	85
Ecuador.....	66	56	71

¹ Includes British Togoland. ² Adjusted for estimated quantity produced in the Gold Coast and moved across the border for marketing in French territories. ³ Includes British Cameroons.

COFFEE. Total world production of green coffee for the marketing year 1955-56 was estimated at 46.5 million bags (of 132.3 pounds each), a record crop season. This production would exceed the revised estimate of 41.3 million bags in 1954-55 by almost 13%, and the 1935-39 average output of 41.6 million bags by about 12%.

Exportable production from the 1955-56 crop was expected to reach 38.3 million bags, more than 5 million bags above the preceding year, and 9.5 million more than in the immediate postwar period, 1946-50.

U. S. COAST GUARD

Coast Guard crewmen break ice on the cutter *Unimak*, on ocean station patrol off the coast of Labrador.

In recent years coffee production has been increasing in Africa, particularly in French West Africa, and in some of the North American countries, notably Mexico. South America, which in 1935-39 accounted for three fourths of all coffee produced, has in recent years produced about two thirds of the world total. The severe frost of 1953 in Brazil damaged coffee trees less than had been feared. This fact, and the large number of new trees coming into production, indicate increasing South American and world output in the years ahead.

United States imports of coffee were estimated at about 19 million bags for 1955. This compares with 21 million bags in 1953 and only 17 million in 1954 when high prices reduced imports sharply. Per capita consumption of coffee in the United States was estimated at 14.6 pounds for 1955, compared with 16.7 in 1953 and the 1935-39 average of 13.9 pounds.

PRODUCTION OF GREEN COFFEE, BY MAJOR COUNTRIES (1,000 bags)

	1935-39 average	1954-55*	1955-56*

* Preliminary estimate. (Source: Foreign Agricultural Service, U.S. Department of Agriculture.)

C. J. ENZLER,
Administrative Officer, Office of the Secretary,
U.S. Department of Agriculture.

COFFIN, Robert P(eter) Tristram, American author and educator; b. Brunswick, Me., March 18, 1892; d. Portland, Me., Jan. 20, 1955. Best known as a poet of the New England scene and Pulitzer Prize winner in 1936, Coffin was also successful as a prose writer, illustrator, teacher, and lecturer.

Coffin was born of an old family of Nantucket whalers, and grew up on his father's salt-water farm at Harpswell on Great Island, Me. He

was graduated from Bowdoin College in 1915, and in the following year received his M.A. degree from Princeton University. As a Rhodes scholar from Maine, he spent the year 1916-17 at Trinity College, Oxford, before his study was interrupted by service in World War I. Returning to Oxford in 1919, he proceeded to take his B.A. degree in 1920 and his B. Lit. degree in 1921.

On his return to the United States in 1921, Coffin accepted an instructorship at Wells College, Aurora, N.Y., where he became professor of English in 1928 and remained until 1934. During this period he published his first volume of poetry, *Christchurch* (1924). Besides his accomplishments as poet and teacher, Professor Coffin was instrumental in introducing at Wells the Oxford system of honors work in English. In 1934 he was appointed Pierce professor of English at Bowdoin, where he remained, with the exception of brief leaves of absence, until his death. From 1937 to 1939 he was book review and poetry editor of *Yankee*, and from 1948 to 1953 he taught at Corpus Christi Fine Arts Colony. Throughout this period he lectured frequently and widely. In 1953-54 he was a Fulbright special lecturer on American literature and civilization at the University of Athens, Greece.

In 1935, Coffin was awarded the gold medal as National Honor Poet. In 1936 he won the Golden Rose of the New England Poetry Society, and in the same year, the Pulitzer Prize for his volume of poetry, *Strange Holiness*, published in 1935. He was elected a member of the National Institute of Arts and Letters in 1946.

His verse is characterized by a highly optimistic view of and an uninhibited sentimentality for man. The imagery of the poems is common and earthy; the language, informal and straightforward; and the tone, robust and masculine. Drawing from his background and youthful experiences, he created in his poems a romantic legend of Maine—its people, history, and natural surroundings. His numerous volumes of poetry include *Dew and Bronze* (1927); *Ballads of Square-Toed Americans* (1933); *Saltwater Farm* (1937); *People Behave Like Ballads* (1946); *Collected Poems* (enl. ed., 1948); and *Apples By Ocean* (1950).

Coffin was a prolific writer. Besides poetry, he wrote several volumes of essays, including *Book of Crowns and Cottages* (1925); *An Attic Room* (1929); *Book of Uncles* (1942); *Mainstays of Maine* (1944); and *Yankee Coast* (1947); three novels, *Red Sky in the Morning* (1935); *John Dawn* (1936); and *Thomas-Thomas-Ancil-Thomas* (1941); several biographies, including *Laud, Storm Center of Stuart England* (1930); *The Dukes of Buckingham* (1931); and *Portrait of an American* (1931); an autobiography, *Lost Paradise* (1934); a volume of literary criticism, *New Poetry of New England: Frost and Robinson* (1938); and a history, *Kennebec: Cradle of Americans* (1937), the first volume in the *Rivers of America* series. He also compiled, with Alexander M. Witherspoon, the popular text, *A Book of Seventeenth-Century Prose and Poetry* (1929).

COINS AND COINAGE. See MINT ESTABLISHMENT.

COKE. World production of coke in 1954 totaled 210,000,000 metric tons, of which the United States produced 26%, as compared with 32% in 1953. (See MINERAL PRODUCTION for output of major countries.)

The United States output of coke declined from 78,836,857 short tons in 1953 to 59,662,496 tons in 1954, including 59,061,442 tons of by-product coke and 601,054 tons of beehive coke. A striking change in 1954 production was the drop in beehive output to less than one eighth of the 1953 figure. This was due largely to lower operating rates and higher fuel efficiency in iron

blast furnaces. Production through August 1955 (48,717,814 short tons) indicated a substantial recovery. The 1954 output required 85,619,619 tons of coal, which, in addition to the coke produced, supplied 3,958,076 tons of coke breeze. Consumption in 1954 was 59,280,816 short tons, of which 51,973,401 tons were used in blast furnaces, 2,568,561 tons in foundries, 3,472,132 tons in other industries, and 1,266,722 tons in residential heating.

COLD, Common. See Index entry.

COLLEGES AND UNIVERSITIES. A selected list of the major colleges and universities in the United States and its possessions and in Canada appears on the following pages. Statistics, unless otherwise indicated, are for the full 1954-55 academic year. All information concerning these institutions has been supplied by the head or registrar of each. (See also EDUCATION; and for a more complete list of institutions of higher education in the United States, consult the *Education Directory*, Part 3, "Higher Education," published annually by the Office of Education, Department of Health, Education, and Welfare, Washington, D.C.)

COLLIER, Constance (real name LAURA CONSTANCE HARDIE), Anglo-American actress: b. Windsor, Berkshire, England, Jan. 22, 1878 or 1880; d. New York, N.Y., April 25, 1955. Constance Collier, regarded by some drama critics as one of the outstanding actresses of the modern theater, was the daughter of Shakespearian actors. She made her stage debut at the age of three or four as a fairy in *A Midsummer Night's Dream*. After appearing in London as one of George Edwardes' famous Gaiety Girls, she joined Wilson Barrett's company in 1896 to play Ancaria in his famous play, *The Sign of the Cross*.

Scoring her first triumph in 1898 as the gypsy Chiara in H. V. Esmond's *One Summer's Day*, Miss Collier joined Sir Herbert Beerbohm Tree's company at His Majesty's Theatre in London in 1901. There followed a seven-year period in which her most memorable parts included the title role in *Tribly*, Mistress Ford in *The Merry Wives of Windsor*, Portia in *Julius Caesar*, Viola in *Twelfth Night*, and Cleopatra in *Antony and Cleopatra*.

Miss Collier made her Broadway debut (with William Gillette) in October 1908 at the Criterion Theatre as Anne-Marie in Henri Bernstein's *Samson*. Among her successes during this period were her roles as Juliet in *Romeo and Juliet* (London, 1910); Imogen Parrott in *Trelawny of the Wells* (New York, 1911); Love in *The Vision of Delight* (London, 1911); Nancy Sykes in *Oliver Twist* (New York, 1912); Emilia in *Othello* (New York, 1914); and Lady Sneerwell in *A School for Scandal* (London, 1915). On July 23, 1915, she made her first appearance as the Duchess of Towers in *Peter Ibbetson*, adapted by John N. Raphael and Miss Collier from the George du Maurier novel. Taking the play to the United States after considerable revision, she induced John Barrymore to play the role of Peter. It received its New York premiere on April 18, 1917, and became one of the plays with which Miss Collier's name is most closely associated. This second period of her career came to a close when her actor-husband, Julian L'Estrange, died late in 1918.

Returning to the stage in a revival of *Peter Ibbetson* in February 1920, Miss Collier em-
(Continued on Page 169)

(COLLIER—Continued from Page 154)

barked on a series of plays that won her unqualified praise. On Sept. 12, 1923, she appeared as the Duchesse de Surrénées in W. Somerset Maugham's *Our Betters*, which played for 548 performances, the longest run of her career. In 1925, at the Haymarket Theatre, she staged a brilliant production of *Hamlet*, in which she played the queen to John Barrymore's Hamlet. In February 1928, she revived *Our Betters* in New York, repeating her London success. Her last New York appearance came in 1939 at the John Golden Theatre as Madame Bernardi in *Aries Is Arising*.

In 1915, Miss Collier went to Hollywood to make her first motion picture, *Intolerance*. Usually playing *grande dame* roles, she subsequently appeared in *Girls' Dormitory* (1936); *Thunder City* (1937); *Kitty* (1946); *The Perils of Pauline* (1947); *An Ideal Husband* (1948); and *Whirlpool* (1950). She was co-author, with Ivor Novello, of *The Rat* (produced 1924) and *Down Hill* (1926), and published *Harlequinade: The Story of My Life* (1930). In her later years she became a dramatic coach, and numbered among her students such diverse personalities as Katharine Hepburn, Shelley Winters, and Marilyn Monroe.

COLOMBIA. The fifth largest country in Latin America (439,829 square miles), Colombia has a population of 12,657,000 (1955 estimate), consisting of approximately 65% mestizos, 20% persons of European descent, 8% Negroes, and 6% Indians. Principal cities, with May 1951 census counts, are Bogotá, the capital (648,324); Medellín (358,189); Cali (284,186); Barranquilla (279,627); Cartagena (128,877); Manizales (126,201); Bucaramanga (112,252); and Cúcuta (95,110).

Government.—The constitution of 1886, as revised in 1936 and 1945, was in effect during 1955, but a National Constituent Assembly existed. Under the 1886 document, executive power is vested in a president elected directly for 4 years and ineligible for re-election until 4 years after serving a term. He is assisted by a 13-man cabinet and a 10-member advisory Council of State. Legislative authority resides in a bicameral Congress of 63 senators and 131 deputies, elected proportionately for 4- and 2-year terms, respectively. Senators are chosen by direct vote of the electorate (1 for each 190,000 persons), and representatives are chosen by the people in each department (1 for each 90,000 persons). An act of Aug. 25, 1954, gave women the right to vote. The judicial system is headed by a 16-member Supreme Court.

Lieut. Gen. Gustavo Rojas Pinilla, who had become president through a military coup on June 13, 1953, was elected president by the Constituent Assembly on Aug. 3, 1954.

Religion and Education.—Roman Catholicism, the dominant religion, has been disestablished since 1936, but on Aug. 3, 1954, the Constituent Assembly appointed two representatives of the church to its membership.

Education in Colombia is free, but not compulsory.

In 1953 there were 16,174 schools of all types in the country (14,223 public and private primary schools with 1,072,532 pupils out of a total of 1,225,130 students). There were 21 universities with 11,629 students enrolled in 1953. The illiteracy rate in 1952 was estimated at 37%.

Finance.—The national accounts for 1954 showed a surplus of 170 million pesos over the budget of 997,-386,500 pesos for that year. Of this surplus, 117 million pesos represented an excess of income over the estimate, and the remaining 53 million pesos resulted from a reduction in planned expenditures. The original 1955 budget of 939 million pesos was increased to 1,629 million pesos by the end of March. Current revenues in the first half of 1955 totaled 729 million pesos, or 55% more than one half of the original budget estimate for the year. The difference was partly the result of a different method used in the collection of income taxes.

Economy and Industry.—By mid-1955, Colombia's cost of living index was 161 (1948 = 100), a point higher than the 1954 average. With the fall of coffee prices toward the end of 1954, Colombia imposed import curbs. The break in the coffee market pointed up the country's "one-crop" economy and gave impetus to the study of means of promoting economic diversification.

Although manufacturing plays only a minor role in the Colombian economy, the industrial production capacity is constantly being expanded. A 1953 census of industry revealed that there were 47,112 manufacturing establishments employing a total of 171,871 persons. Gross production was valued at approximately 4 billion pesos (U.S.\$1.6 billion). Foodstuff processing constituted the most important single industry, with a gross production value of \$550 million, followed by beverages (160 million), textiles (145 million), shoes and apparel (\$108 million), chemicals (\$61 million), and nonmetallic minerals, not including petroleum and coal (\$59 million).

The Cauca Autonomous Regional Corporation, similar in constitution and purpose to the Tennessee Valley Authority in the United States, was created in 1955, and a 24,000-kw. hydroelectric plant was completed on the Anchicaya River near Cali. Construction of a 25,000-kw. transmission line (to connect Belénito, the site of the Paz del Rio steel mill, with the thermoelectric power plant at Paipa) was begun, and plans were completed for building two new cement plants (one each in Boyaca and Caldas departments).

Crude oil production totaled 5,532,000 metric tons in 1954. In the first 7 months of 1955, production fell to 22,592,000 barrels from approximately 24 million barrels in the like period of 1954. The government, however, encouraged new exploration by increasing petroleum depletion allowances. International Petroleum (Colombia), Limited, is constructing a 25,000-barrel refinery at Cartagena, which is expected to be in operation before the end of 1958. The output will supplement that of the plant at Barranca-

bermeja, so that the two will render Colombia self-sufficient in oil products. In 1955 final arrangements were made for construction of an oil products pipeline from Buenaventura, on the Pacific coast, to Cali.

Agriculture and Food Production.—Colombia's principal cash crop is coffee. Production in 1954-55 totaled 6.5 million bags (132.28 pounds each); 7.2 million bags, or 16% of the total expected world production, were forecast for the 1955-56 crop year. Colombia's rising coffee production reflects the ever greater acreages devoted to the crop. An average of 660,000 hectares were planted to coffee between 1946 and 1951, but by 1954 the figure was 30% greater.

In 1954 significant gains over 1953 were made in the production of cotton, rice, and sugar. Cotton production rose from 20,000 to 29,000 metric tons; rice, from 285,000 to 310,000 metric tons; and sugar, from 218,000 to 245,000 metric tons. The 65 million pounds of tobacco produced in 1955 was 16% greater than the 1954 crop. Barley production decreased considerably in 1954, with only 48,000 metric tons output, compared with the 1953 crop of 65,000 metric tons. The potato output fell from 610,000 metric tons in 1953 to 526,000 in 1954. Banana production remained stable. In 1954 there were 1,157,000 horses, 1,118,000 sheep, and approximately 15.5 million cattle in the country. Over two thirds of the latter had the foot-and-mouth disease.

Foreign Trade.—Colombia's foreign trade reached record heights in 1954, but dropped off in 1955. The 1954 imports amounted to 1,626.6 million pesos (1 peso equals U.S.-\$0.3984), and the exports for that year were valued at 1,640.9 million pesos. Imports valued at 879 million pesos in the first half of 1955 were 114 million pesos greater than in the first half of 1954. The exceptionally heavy import volume, in which motor vehicles were important, was due partly to importers' apprehension of increasingly severe import restrictions. Exports totaled 636 million pesos in the first half of 1955, or 258 million pesos less than in the same period of 1954. The reduction was mainly attributable to coffee, of which exports were 4,865,241 bags for the crop year ended June 30, 1955, a substantial reduction from the 6,923,647 bags exported in the coffee year ended June 30, 1954. The United States, Colombia's major customer, took only \$194 million worth of coffee during the first half of 1955, compared with \$307 million for the same period of 1954.

Transportation and Communication.—Colombia's 17 railway systems (2,154 miles of track) have been nationalized since 1954. In June 1955 a second International Bank loan of \$15.9 million was made for a 190-mile rail extension of the Magdalena Valley Railroad. In 1952 there were 11,200 miles of roads available for the country's 43,000 passenger cars and 34,000 commercial vehicles. In 1955 a 236-mile road from Medellín to Turbo, on the Gulf of Urabá, was inaugurated. In civil aviation, Colombia ranks third, after Brazil and Argentina, among South American countries. In 1953 the airlines carried 1,018,555 passengers and 117,953 metric tons of cargo. In September 1954, the government bought all the airfields in the country from Avianca, the leading civil airline. There were 128,970 telephones in operation in 1954.

Principal Events, 1955.—During 1955, President Gustavo Rojas Pinilla steadily gained power, and despite increasing opposition from Conservatives

as well as Liberals, it became ever more clear that his was becoming a dictatorial regime. By July 30, press censorship, previously imposed in isolated cases, was extended throughout the country and involved both opposition and pro-government newspapers. All copy, for foreign or domestic use, had to be approved by the army. Rojas, on May 13, blamed armed flare-ups in various parts of the country on Communists, but on June 2, a newspaper was subjected to censorship for violating a government ban on publication of reports about public disturbances. The paper had reported that outlaws wearing army uniforms had killed 27 persons in an attack on a community near Tolima. The highly respected Liberal paper, *El Tiempo*, was shut down completely by the government on August 4. On August 29 the government announced its intention to take control of the price and distribution of newsprint as a first step toward nationalizing Colombian publications.

Colombia's backlands feud between Liberals and Conservatives continues. Rojas stated that 2,000 or more lives had been lost in 1955, and other sources estimate that the six-year death toll in Colombia's "civil war" has reached 150,000.

On Aug. 21, 1954, a few days after making General Rojas president, the Constituent Assembly adopted a reorganization program that set July 20, 1955, as the date for a regular congress to take over. In June 1955, however, Rojas announced that the Constituent Assembly would not sit during the year, stating that "when (a parliament) becomes a tribune for libel, it must be closed." To strengthen his regime, he placed inexperienced army officers in many civilian posts.

ROBERT L. CARMIN,
Associate Professor of Geography,
University of Illinois.

COLOMBO PLAN. See COMMONWEALTH OF NATIONS.

COLORADO. Western state, United States; admitted to the Union, Aug. 1, 1876. The "Centennial State" ranks 7th in area and 33d in population (1955) among the 48 states.

Area and Population.—Area: 104,247 square miles (land, 103,922; inland water, 325), divided into 63 counties. Population: (1950) 1,325,089; (est., July 1, 1955) 1,508,000. Places with 1950 populations above 10,000 are as follows:

Aurora.....	11,421	Fort Collins.....	14,937
Boulder.....	19,999	Grand Junction.....	14,504
Colorado Springs.....	45,472	Greeley.....	20,354
Denver (capital).....	415,786	Pueblo.....	63,685
Englewood.....	16,869	Trinidad.....	12,204

Executive.—Chief state officers in 1955:

Governor: Edwin C. Johnson (Democrat)
Lieutenant Governor: Stephen L. R. McNichols
Secretary of State: George J. Baker
Auditor: Homer F. Bedford
Treasurer: Earl E. Ewing
Attorney General: Duke W. Dunbar
Commissioner of Education: H. Grant Vest

Constitution and Judiciary.—The present constitution went into effect in 1876. The Supreme Court comprises 7 justices; chief justice in 1955: Wilbur M. Alter.

Legislature.—The General Assembly (Senate 35 members; House of Representatives, 65) meets annually commencing the first Wednesday after the first Tuesday in January—for regular sessions in odd-numbered years and for budget sessions in even-numbered years.

The 1955 regular session increased the state property tax levy from \$2.71 to \$3.66 per \$1,000 assessed valuation to finance a 10-year institutional building program; authorized anticipation warrants by cities and counties to defray construction or improvement costs on public projects; revised the gross ton-mile tax on trucks and set up a port of entry system to improve collection of such revenue; and increased the state highway patrol by 60

men. Authorization was given for the expenditure of \$12,365,000 for new construction at the University of Colorado, a \$35 million highway construction program, a \$16 million bond issue to finance a toll tunnel under the Continental Divide, and more than \$30 million in construction at state institutions. Other legislation produced a new narcotics code; permitted mineral claims to be located on state-owned lands; prohibited solicitation of absentee election ballots; provided for equal pay for equal work, regardless of sex; created an Antidiscrimination Commission and a commission for reorganizing the state government; set up a new state military code; and improved the teachers retirement plan.

Finances.—In the 1954-55 fiscal year, treasury receipts totaled \$238,549,617.84; expenditures, including transfers, \$232,619,123.38. On June 30, 1955, the treasury cash balance was \$58,752,804.56, and there was no state bonded indebtedness.

Taxation.—State tax revenue (1955 fiscal year): \$129,218,000, including \$74,630,000 from a 2% general sales tax and selective sales and gross receipt taxes; \$17,143,000 from licensing; \$18,092,000 from individual income taxes; \$5,677,000 from corporate income taxes; and \$8,127,000 from property taxes. Colorado does not levy a poll tax.

Banking.—As of Jan. 1, 1955, deposits in Colorado's 153 national and state banks reached an all-time high of \$1,551,278,133, representing an increase of 8.5% over Jan. 1, 1954. The Denver metropolitan area, with a total of \$66,489,634, accounted for more than half of the increase. As of June 30, 1955, there were 52 state and federal savings and loan associations with total resources amounting to \$378,792,000.

Education.—School attendance is compulsory for all between the ages of 8 and 16, inclusive. The estimated total income for public education in the 1954-55 fiscal year was \$86,250,000, including \$1,500,000 from the federal government, \$14,750,000 from the state, and \$70,000,000 from local school districts. Operating expenditures were estimated at \$77,400,000 (\$293.98 per pupil), and capital outlays for construction and improvement totaled an estimated \$28,000,000. During the school year 1954-55 there were an estimated 292,000 elementary and secondary students, and 12,676 teachers, whose salaries averaged \$3,530. Students attending higher institutions numbered 28,884.

Social Welfare.—Public assistance expenditures from state and federal funds in the calendar year 1954 amounted to \$69,277,220.73, including \$51,464,126.17 for old-age assistance, \$7,066,550.23 for dependent children, \$325,420.17 for the blind, \$3,093,089.03 for the needy disabled, and \$3,099,794.16 for general assistance. State and county office administration expenses totaled \$3,312,359.37. Monthly averages of persons receiving assistance were: aged, 54,016; dependent children, 16,072; blind, 336; and needy, 4,652. The 1955-56 budget for correctional institutions was \$2,311,704.

COLORADO WELFARE INSTITUTIONS (As of Aug. 31, 1955)

Type of institution	No.	Pop.
Hospitals for mentally deficient and epileptic . . .	2	1,044
Hospitals for the mentally ill	1	5,660
Schools for the deaf and blind	1	202
Homes for dependent children	1	223
Industrial schools for boys	1	221
Industrial schools for girls	1	104
Soldiers and sailors homes	1	50
Reformatories for boys	1	356
Prisons	1	1,452

Labor Force.—Nonagricultural employees for the calendar year 1954 averaged 400,600, and by July 1955 had increased to 419,600. Unemployment benefits paid to a monthly average of 19,100 insured workers in the first eight months of 1955 totaled \$2,504,704.

Manufacturing.—An estimated 1,791 establishments produced \$438,466,000 in value added by manufacture in 1954. Gross sales of manufac-

turers, traders, and jobbers were \$657,000,000. Weekly earnings for production workers averaged \$72.94 for 40.3 hours in 1954 (\$71.34 for 41 hours in 1953) and rose to \$78.47 for 41.3 hours in June 1955. Employees in manufacturing industries in June 1955 numbered 64,500.

Major manufactures include food and kindred products, which in 1953 paid \$52,207,000 in wages to 14,581 employees and added \$100,765,000 in value by manufacture; and primary metals, which paid \$33,704,000 to 7,938 employees and added \$76,284,000 in value. Investment in new plant and equipment totaled \$26,583,000 in 1953.

Mining.—Mineral production, excluding uranium, was 14% higher in value in 1954 than in 1953. Colorado ranked first in 1954 in the production of uranium, which with its vanadium by-products was valued at \$118 million. In 1953, the state ranked first in output of molybdenum, second in fluorspar, third in feldspar, and fourth in beryl, columbium-tantalum, lithium minerals, gold, lead, and tungsten. Colorado ranked 17th in value with its 1953 output, accounting for 1.47% of the United States total. There were 13,843 persons employed in the state's mineral industries in 1954.

COLORADO MINERAL PRODUCTION, 1954 (In short tons, except where noted)

Mineral	Quantity ¹	Value ¹
Petroleum (bbl.)	42,000,000	\$120,000,000
Molybdenum (pounds)	43,000,000	16,107,000
Coal	3,000,000	9,000,000
Sand and gravel	13,000,000	7,714,500
Zinc	34,750	4,814,400
Lead	17,700	3,325,000
Gold (troy ounces)	95,000	3,127,000
Fluorspar	58,000	3,077,172
Silver (troy ounces)	3,400,000	864
Tungsten concentrate (60% WO ₃)	4,400	2,613,600
Copper	34,000,000	1,911,000
Natural gas (1,000 cubic feet)	800,000	1,575,000

¹ Preliminary figures. ² Value included in "Other minerals." ³ Excluding limestone used in making cement and lime. ⁴ Excluding uranium.

Agriculture.—Cash farm income in the first half of 1955 totaled \$172,555,000, and for the full year 1954 amounted to \$453,520,000, including \$284,267,000 from livestock and livestock products, \$158,038,000 from crops, and \$11,215,000 from government payments. Receipts from principal crops and livestock in 1954 included: cattle (\$192,250,000), dairy products (\$29,395,000), eggs (\$9,589,000), hogs (\$12,922,000), wheat (\$51,709,000), sugar beets (\$18,591,000), dry edible beans (\$12,725,000),

COLORADO CROP STATISTICS

Crop (and unit of production)	Average 1944-53	1954	Est. 1955
Apples (1,000 bu.)	1,316	1,600	1,180
Barley (1,000 bu.)	14,215	7,020	6,400
Beans, dry (1,000 bags)	1,978	1,991	2,062

potatoes (\$12,603,000), and hay (\$13,398,000).

The 1954 federal census of agriculture (prelim.) shows that the state's 40,749 farms were worked by an estimated 98,611 persons. Farms covered 38,385,234 acres (harvested cropland, 5,219,689; irrigated land, 2,202,921), and averaged 942 acres and \$36,450 in value for land and buildings. Farms with electricity numbered 37,915; with telephones, 27,424. Livestock on farms (Jan. 1, 1955) included 2,054,000 cattle, 1,702,000 sheep, 190,000 hogs, and 2,546,000 chickens (excluding commercial broilers).

Tourists.—Tourist travel represents Colorado's fourth largest industry. In 1954, the income derived from 3,883,000 vacationists totaled \$298,408,000, or an increase of 12.5% over 1953. The 1955 estimate (as of Sept. 22, 1955) was 3,916,000 tourists, spending \$326,719,000.

Transportation and Communications.—Funds available for roads and highways in 1954 totaled \$32,050,463.33, and newly completed construction aggregated 525 miles of roads and 60 bridges.

Highways and roads on Jan. 1, 1955, totaled 74,282 miles. Registered *motor vehicles* (August 1954 est.) numbered 672,000. There were 14 *railroads* (1954) operating 3,995.04 line miles, 5 regularly scheduled *airlines*, and 121 civil and military *airports and airfields*, including 73 personal-use landing strips.

Communications media in 1955 included 44 AM and 4 FM *radio stations* and 10 operating *television outlets*; 26 daily and 130 weekly *newspapers*; and (Jan. 1, 1955) 170,859 business and 365,985 residential *telephones*.

Principal Events, 1955.—The U.S. Air Force Academy was dedicated at its temporary campus at Lowry Air Force Base in Denver on July 11, and a first class of 306 students was sworn in. Plans went forward for construction of the permanent academy buildings at Colorado Springs (see also AIR FORCE, U.S.).

Denver became the center of world interest on September 24 when President Dwight D. Eisenhower suffered a heart attack at the summer White House and began a long convalescence at Fitzsimmons General Hospital, also in Denver.

Republican State Sen. Will Nicholson was elected mayor of Denver by a narrow margin over District Attorney Bert Keating, his Democratic opponent, in a run-off election on June 21. He took office on July 1 for a four-year term, succeeding Quigg Newton, a Democrat.

Denver's five-year building boom, which began in 1950 and rose to a \$100 million-plus mark in 1954, with a total of 26,665 new dwelling units erected since Jan. 1, 1950, continued in 1955 with a \$50 million business construction program. Largest single unit was the Webb and Knapp \$35 million department store-hotel complex being built at Courthouse Square.

Southeastern Colorado was plagued alternately by dust storms and floods, the former, during March, blowing away or damaging 60% of the new wheat crop. During May, floods in the same area caused damage to Trinidad and Starkville.

COMMONWEALTH OF NATIONS. This group of eight freely associated, independent countries (Australia, Canada, Ceylon, Great Britain, India, New Zealand, Pakistan, and South Africa) and their dependencies is linked only by a common recognition of the British sovereign as "Head of the Commonwealth" and symbol of their association. All except India, which is a republic, owe allegiance to Queen Elizabeth II. Although there are no other constitutional links between Commonwealth countries and no central executive, there is often a similarity of approach to world problems, as well as a common legislative pattern, an inheritance of British law, and inter-Commonwealth tariff preferences. Each country defines its own citizens, and the sum total of such citizens are British subjects or Commonwealth citizens. The component parts of the Commonwealth are shown in Table 1.

¹ Includes Northern Ireland, Channel Islands, and Isle of Man. ² Not an integral part of the Commonwealth. ³ Excluding dependencies. ⁴ Excluding Kashmir. ⁵ Including dependency. ⁶ Including insular territories.

Relations between the British government and the other Commonwealth governments are conducted through the Commonwealth Relations Office in London and the departments of external affairs in the other Commonwealth capitals. High commissioners, with functions similar to those of ambassadors, are exchanged; communication between corresponding ministers is frequent. The crown is represented in countries owing allegiance to it by a governor general. Most dependencies of Great Britain are administered through the Colonial Office; relations with condominiums and certain protected states not properly part of the Commonwealth are conducted through the Foreign Office, and certain territories come within the jurisdiction of the Commonwealth Relations Office.

International Relations.—All the sovereign states of the Commonwealth are members of the United Nations. Great Britain is a member of the Caribbean Commission (q.v.), and Australia,

New Zealand, and Great Britain are members of the South Pacific Commission. Great Britain and Canada are members of the North Atlantic Treaty Organization (q.v.); Great Britain is a member of the Western European Union (q.v.); Great Britain, Australia, New Zealand, and Pakistan are members of the Southeast Asia Treaty Organization (q.v.); and Australia and New Zealand are members of the Pacific or ANZUS Council (q.v.).

Colombo Plan.—The Colombo Plan for Co-operative Economic Development in South and Southeast Asia, a series of coordinated development plans which envisages an expenditure of \$5,288.4 million in 1951–57, is designed to raise living standards in the area. There is a Bureau for Technical Cooperation in Colombo but no central secretariat, and the development plans of the countries concerned are coordinated through a Consultative Committee. Membership includes all the independent Commonwealth countries except South Africa, the British dependencies in the area, South Viet-Nam, Cambodia, Laos, Burma, Nepal, Indonesia, Thailand, Japan, the Philippines, and the United States. A close liaison is maintained with the International Bank for Reconstruction and Development (IBRD) and United Nations technical assistance agencies.

The annual report of the Consultative Committee, published after its seventh meeting held at Singapore on Sept. 29–Oct. 22, 1955, which extended the life of the plan until June 1961, showed that there had been a noticeable increase in industrial and mineral production (steel production, for example, increased 12%) and power generation during the year. The expanding world economy had promoted economic progress, though some countries had been adversely affected by a fall in export prices. Increases in the world supply of capital equipment and greater world demand for primary products had resulted in an expansion of the foreign trade of countries in the area, making it easier for them to finance development programs. Total development expenditure was estimated at £827 million for 1955–56, as compared with £724.6 million for 1954–55 and £541.9 million for 1953–54. Of the total expenditure during the past two years, over two fifths had been devoted to agriculture, irrigation, and multipurpose projects; one fourth to transportation; and one fourth to public health, education, and housing.

Many of the targets laid down in the original report now seem likely to be reached. Since 1951 the plan's technical assistance program has provided 3,715 experts for the area and has made 7,159 training awards. In spite of this progress, however, living standards are still below the pre-World War II level, and the next stage of development will require a still greater effort on the part of the countries concerned.

Commonwealth Relations.—There is a close relationship between the members of the Commonwealth. With the exception of Canada, all the Commonwealth members and their dependencies are members of the sterling area.* There is considerable cooperation in defense; weapons and equipment are often standardized, and personnel exchanged for training purposes. A number of technical organizations meet regularly; some, such as the Commonwealth Economic Committee, the Executive Council of the Commonwealth Agricultural Bureaux, and the Commonwealth

* The sterling area includes, besides members of the Commonwealth (except Canada), Burma, Iceland, Iraq, Ireland, Jordan, and Libya.

BRITISH INFORMATION SERVICES

Commonwealth prime ministers, with Queen Elizabeth II at Buckingham Palace on Feb. 14, 1955, are (l. to r.): Huggins (Rhodesia and Nyasaland), Mohammad Ali (Pakistan), Menzies (Australia), Swart (representing South African Prime Minister Strijdom), Churchill (Great Britain), Holland (New Zealand), St. Laurent (Canada), Nehru (India), and Kotelawala (Ceylon).

Shipping Committee, maintain permanent headquarters.

Ministers of the Commonwealth countries meet periodically to discuss matters of common concern. A meeting of prime ministers was held in London on Jan. 31-Feb. 8, 1955, at which the international situation, economic progress of the Commonwealth, nuclear energy, disarmament, and regional defense were discussed. At the same time, it was announced that when Pakistan became a republic, she would remain a member of the Commonwealth on the same terms as India.

Commonwealth External Trade.—The value of exports from the sterling area in the first six months of 1955 was 6% higher than in the same period of 1954. United Kingdom exports rose by nearly 4%, and those from the rest of the sterling area (excluding oil from Iraq and the Persian Gulf) by 7%. Imports for the sterling area as a whole showed an increase of 15%, as compared with the first half of 1954. United Kingdom imports rose by 14% in value and 9% in volume. A 13% rise in the exports of sterling countries to each other was accounted for largely by greater exports of wheat and rice to India and increased value of the entrepôt trade in rubber and tea. There was little change in the proportion of total sterling exports to nonsterling countries in the first half of the year. Imports of nonsterling goods by the sterling area rose by 22% and dollar purchases by 35% in the same period, although the momentum of the inroads into Commonwealth trade made by West Germany and Japan seemed to be slowing down.

Slightly less than half of the trade of Commonwealth countries is still with each other, however, while the remainder is closely integrated with the general pattern of world trade. Trade figures for the sterling Commonwealth are shown in Table 2. (For Canadian figures see CANADA.)

Colonial Affairs.—Britain's main contribution to colonial economic development and social progress is made through the Colonial Development and Welfare Acts, and a new act, extending their life to March 31, 1960, and authorizing the expenditure of an additional £80 million, was passed on March 29, 1955. Since £40 million remained unspent from earlier authorizations, £120 million was available for development purposes in the period 1955-60.

During 1954-55, expenditure on development and welfare projects was £15.6 million, making

a total of £100 million since 1945. The total expenditure from British taxation on the colonial territories in 1954-55 was £41,483,000, including £33,376,000 for specific purposes or as

grants-in-aid, and loans raised on the London market by colonial territories amounted to £16 million. The IBRD made a loan of \$24 million for the East African Railways and Harbours Administration on March 15, 1955, and \$5 million from United States foreign aid funds will finance economic projects in British African territories. Gross capital formation in the colonial territories totaled about £400 million in 1954, and was expected to be about the same in 1955.

During the year 1954-55 the Colonial Development Corporation, a government-created agency designed to supplement private capital, sanctioned capital commitments of £4.5 million. At the end of 1954 the corporation had 56 projects and investigations in hand, with a total capital commitment of £47.8 million, of which £28.5 million was already employed. Expenditure on the Overseas Food Corporation's experimental agricultural scheme in East Africa since its inception in 1951 amounted to £3.8 million by March 1955. This project was taken over by the Tanganyika Agricultural Corporation, which came into being on March 30, 1955.

During the year 1954-55 a number of colonial governments, notably Nigeria, Jamaica, and British Honduras revised their development plans following reports by IBRD missions. Among the most important projects under way are the Owen Falls hydroelectric project in Uganda, the development of Tema harbor in the Gold Coast, and the Volta River project, also in the Gold Coast, which is still in the preparatory stage.

The volume of colonial production and exports was about 5% higher in 1954-55 than in 1953-54. The value of imports fell by about 2%, or £16 million, and the colonial territories as a whole showed a favorable trade balance of about £25 million. Colonial revenues totaled £422.3 million and expenditures £416.5 million in 1954, as compared with £390 million and £389 million, respectively, in 1953. Major exports from the colonial territories in 1953 and 1954 are shown in Table 3.

Political progress or proposals looking toward greater self-government were made in no less than 22 territories in the first nine months of 1955. Elections were held in Malaya, Singapore, Nigeria, and Gambia, resulting in the virtual control of their governments by elected local representatives, and in Jamaica the People's National Party replaced the Jamaica Labour Party, taking over the government for the first time. BRITISH WEST AFRICA; JAMAICA; MALAYA, FEDERATION OF; SINGAPORE.)

Constitutional progress in Cyprus (q.v.) was again hampered by the movement for *enosis* (union with Greece) and by local disturbances, which resulted in the proclamation of a state of emergency on November 26, but a constitution affording the island increased self-government was offered to it in August. A Greek-Turkish-British conference held in London on August 29–September 7 was suspended without result, and Greek efforts to place the future of Cyprus on the agenda of the tenth session of the U.N. General Assembly failed on September 23.

In Uganda, following constitutional changes and modification of the 1900 agreement, Kabaka Mutesa II returned to the throne of Buganda on Oct. 17, 1955. A royal commission investigating land and population problems in East Africa submitted a comprehensive report on June 9, after nearly three years' work. The emergency situation in Kenya, which was costing the territory £16 million a year, improved to such an extent that security forces were progressively reduced from July on. Tanganyika had been visited by a United Nations mission in August–September 1954; its report, issued in January 1955, was not acceptable to the British government. (See also BRITISH EAST AFRICA.) In Malaya, where the emergency situation had improved immeasurably, an amnesty offer was made on September 8 to the remaining terrorists if they surrendered.

On Feb. 1–March 2, 1955, Princess Margaret undertook an official tour of the British West Indies (q.v.).

COMMUNISM. By the end of 1955, Moscow-dominated Communist governments were in control in 16 countries: the Soviet Union, Estonia, Latvia, Lithuania, Poland, the German Democratic Republic (East Germany), Czechoslovakia, Rumania, Hungary, Bulgaria, Albania, the Mongolian People's Republic (Outer Mongolia), the Korean Democratic People's Republic (North Korea), the Chinese People's Republic, Tibet, and North Viet-Nam. Communist-led guerrilla forces fought against the legal governments in Laos, Malaya, and the Philippines. In addition, Yugoslavia continued to be controlled by an independent league of Communists, friendly but not subservient to Moscow. Thus more than half

of Europe and over half of Asia lived under Communist rule. Altogether, nearly one third of the world's population was governed by Communist regimes.

World Strategy and Tactics.—In 1955 the major question concerning international communism was whether the replacement of the Malenkov government in the USSR by the new ruling team of Bulganin and Khrushchev would change world Communist policies. By the end of the year, it was clear that the goals of international communism remained the same as before.

The Soviet Union's first deputy premier, Lazar M. Kaganovich, in a major policy speech delivered in Moscow on Nov. 6, 1955, on the occasion of the 38th anniversary of the Russian Revolution, asserted that revolutionary ideas travel "throughout the world without visas and fingerprints," and that "the twentieth century is a century of the triumph of socialism and communism." Nikita Khrushchev, first secretary of the Communist Party of the USSR, openly expressed the hope that Communists would eventually gain control of the governments of all countries in the free world. He and other Communist spokesmen throughout the world also continued to advocate colonial revolution. The more immediate aims of dividing and disarming both free Europe and non-Communist Asia were pursued with the same Communist vigor as in the past.

Thus, all Communist parties demanded that the West destroy its stockpile of atomic and hydrogen bombs, and end further manufacture of these weapons of mass destruction. Communists everywhere insisted that the United States armed forces must withdraw from Europe and Asia, and that all United States military bases on foreign soil should be abandoned. European Communists opposed the North Atlantic Treaty Organization (NATO) and rearmament of the German Federal Republic (West Germany). The Austrian and Greek Communist parties urged their respective countries to remain neutral in the East-West cold war. In the Far East, all Communist parties opposed the Southeast Asia Treaty Or-

"ASK THE MAN WHO WEARS ONE!"

THIEF IN THE LOS ANGELES MIRROR

ganization (SEATO), as well as any United States influence in the Pacific area. Near Eastern Communists condemned the Baghdad defense pact signed by Iraq, Turkey, Pakistan, and Iran. Throughout the free world, Communist parties urged that the embargo on shipments of war-potential machinery to the Soviet orbit be removed.

Although there was no change in the basic strategy of international communism, some moderation of tactics occurred in 1955. In general, most Communist parties of the free world avoided violence, tried to act like legal political organizations, and strove for united fronts with socialist and liberal groups. Both the Japanese and United States parties abandoned much of the clandestine underground existence which they had practiced for the past several years. Instead of threatening conquest of Formosa by force, the Chinese Communist Party asked for negotiations with the United States aimed at the peaceful transfer of Formosa to the Chinese People's Republic. The North Korean Labor Party (the Communist-front party of North Korea) urged disarmament of both North and South Korea, and peaceful unification of the country. India's Communist Party has publicly renounced violence and openly tried to infiltrate the ruling Congress Party. These programs, of course, merely marked an intensification of the more subtle tactics pursued by world Communists since Stalin's death in March 1953.

In 1955 the French Communist Party supported nationalistic elements in Algeria, Morocco, Tunisia, and Indochina. However, the party demanded autonomy rather than independence for these colonial areas, and expressed the hope that they would remain within the French Union. In Indochina, the Viet-Nam Labor Party (North Viet-Nam Communist-front) was evidently confident of winning control of South Viet-Nam peaceably. The party was eager that the all-Vietnamese elections planned for 1956 be held on schedule. Much less confident was the German Communist Party, which seemed in no hurry for all-German elections. The main Communist slogans in South Africa were "equality for the Negroes," and "Africa for the Africans." In the Middle East, Communist parties were pro-Arab, anti-West, and anti-Israel. The parties urged Arab countries to purchase their arms from the Soviet bloc. Communist propaganda in Latin America during 1955 was much the same as before, demanding an end of United States political and economic influence. The Brazilian Communist Party supported the successful candidacy of non-Communist Dr. Juscelino Kubitschek in the presidential elections of Oct. 3, 1955.

Within the Soviet orbit, Communist parties abandoned the so-called "new course" inspired by former Soviet Premier Georgi Malenkov, which stressed expansion of consumer goods output. Instead, during 1955 there was a return to emphasis on heavy, war-potential industry; and collectivization of agriculture was accelerated. The latter was particularly stressed in Communist China, where one sixth of its vast rural population is already in producer cooperatives and collective farms.

Most satellite parties escaped major purges during the year, although several Hungarian Communist leaders were demoted, and the Chinese Communist Party appeared to be commencing widespread punishment of party members who live too luxuriously. An unusual event in 1955 was the visit of Soviet leaders Bulganin

and Khrushchev to Marshal Tito of Yugoslavia, resulting in an unprecedented Moscow admission that a foreign Communist party could pursue policies independent of the USSR. This, however, seems to be a Soviet gesture of friendship toward Yugoslavia alone. Elsewhere in the world, Moscow tried to make all Communist parties follow the orders originating in the Kremlin.

World Communist Strength.—In 1955 there were approximately 26 million members of Communist or Communist-front labor and socialist parties throughout the world. Of these, 21.5 million lived in the Soviet orbit. The largest single concentration of Communists in the free world was located in western Europe, where about 4 million party members resided. Elsewhere the number of party members was very small. There were only 119,000 Communists in the free countries of the Far East, 90,000 in the Middle East (including India and Ceylon), and 28,000 in all Africa. The entire Western Hemisphere contained less than a third of a million members, with the vast majority located in Latin America. The largest Communist parties in the Soviet orbit in 1955 were those of the USSR and Communist China. Outside that orbit, the biggest parties were those of Italy and France.

The membership of western European Communist parties in 1955 was approximately as follows: Italy, 2,576,000; France, 506,000; West Germany, 125,000; Austria, 60,000; Great Britain, 35,000; the Netherlands, 33,000; Belgium, 30,000; Finland, 30,000; Sweden, 30,000; Greece, 20,000; Denmark, 16,000; Switzerland (Swiss Labor Party), 8,000; Norway, 7,500; Spain, 5,000; and Portugal, 3,500. Communist parties were illegal in Greece, Spain, and Portugal. The Communist Party of Great Britain entered 17 candidates in the May 26 general elections to the British House of Commons; all lost, and the total vote for the Communist candidates was only 33,144.

The membership of the Communist parties of the eastern European Soviet satellites in 1955 was approximately as follows: Czechoslovakia, 1,677,000; Poland (United Polish Workers' Party), 1,297,000; East Germany (Socialist Unity Party), 1,230,000; Hungary (Hungarian Workers Party), 1,000,000; Rumania, 720,000; Bulgaria, 368,000; and Albania (Albanian Workers Party), 44,000. The Communist Party of the Soviet Union totaled 6,882,000. The independent League of Communists of Yugoslavia had a membership of 709,000.

In the Far East, membership in the Communist parties was roughly as follows: Chinese People's Republic, 6,500,000; Korean Democratic People's Republic (North Korean Labor Party), 1,000,000; Indochina (Labor Party), 721,000; Japan, 60,000; Mongolian People's Republic (Mongolian People's Revolutionary Party), 28,000; Burma, 24,000; Indonesia, 15,000; Australia, 6,000; the Philippines, 5,000; Thailand, 5,000; and Malaya, 4,000. Communist parties are illegal in Burma, Formosa, southern Indochina, South Korea, Malaya, Nepal, the Philippines, and Thailand. In the 1955 elections to the Indonesian Parliament, beginning on September 29, the candidates of the Indonesian Communist Party polled more than 6 million votes.

In the Middle East and Africa, Communist party membership was approximately as follows in 1955: India, 40,000; Iran (Tudeh Party), 20,000; Algeria, 15,000; Syria, 10,000; Lebanon, 8,000; Pakistan, 5,000; Morocco, 4,000; Tunisia, 4,000; Israel, 3,700; Egypt, 3,000; Union of

South Africa, 2,000; Ceylon, 2,000; and Iraq, 1,000. Communist parties were illegal in Iran, Iraq, Jordan, Lebanon, Pakistan, Syria, Turkey, Egypt, French North Africa, the Union of South Africa, and the Anglo-Egyptian Sudan, while in India, Communists were under strong governmental restriction. In the July 26, 1955 elections to the Israeli Knesset (Parliament), Communists won only 6 of the total 120 parliamentary seats.

In Latin America, the Communist parties are outlawed in Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, El Salvador, Guatemala, Haiti, Honduras, Nicaragua, Panama, Paraguay, Peru, San Domingo, and Venezuela. Party membership in 1955 was approximately as follows: Brazil, 60,000; Argentina, 40,000; Chile, 40,000; Cuba (People's Socialist Party), 30,000; Venezuela, 20,000; Uruguay, 15,000; Peru, 10,000; Colombia, 5,000; Costa Rica, 5,000; Ecuador, 5,000; Mexico, 5,000; Bolivia, 2,000; Paraguay, 2,000; El Salvador, 1,000; Panama, 1,000; Honduras, 500; and Nicaragua, 500. In 1955, Communists controlled the majority of Ecuadoran trade unions, and the Mexican electrical workers' union. The Brazilian Communist Party, although illegal, published 6 newspapers openly and was believed to control approximately half a million Brazilian voters.

Canada.—The Canadian Labour-Progressive Party, headed by its secretary general, Tim Buck, is, in effect, the Communist party of Canada. In 1955, it opposed Canada's alliance with the United States, and urged that Canadian trade with the United States be reduced. Other propaganda of the party demanded recognition of Communist China, more trade between Canada and the Soviet orbit, and the reduction of Canadian armaments. The party had approximately 16,000 members.

United States.—The Communist Party of the United States in 1955 had no more than 25,000 members, of whom one third to one half resided in the area of Greater New York. The remainder were located mainly in the industrial cities of the North Atlantic states, the Great Lakes region, and the Pacific coast. Despite all efforts, the party in 1955 remained almost entirely urban, with virtually no influence in even the poorest rural areas.

In August the U.S. Communist Party announced its 1955 goals, as follows: (1) All atomic and hydrogen bombs in the United States should be destroyed, and the United States must conduct no further nuclear bomb tests. (2) The United States should reduce its conventional armaments, trade heavily with the Soviet orbit, and have close cultural relations with Communist countries. (3) Formosa must be surrendered to Communist China, which should be admitted to the United Nations. (4) West Germany must not arm, and should be converted into a "people's democracy" of the Communist satellite type. (As usual, the United States party simply parroted Soviet foreign policy, demonstrating once again that it functions as a tool of the USSR.)

During 1955 the United States government continued its legal prosecution of the Communist Party leadership. On January 10 the U.S. Supreme Court refused to review the conviction on Jan. 21, 1953, by a federal district court in New York City, of 13 secondary party leaders¹ for

violating the Smith Act, which declares it a crime to teach or advocate the overthrow of the United States government by force or violence.

On Jan. 26, 1955, Claude M. Lightfoot, a Communist Party leader in Chicago, became the first person in the United States convicted under a hitherto unused section of the Smith Act, making it a crime to belong to an organization while knowing that it conspires against the United States government. On February 15, a federal district court sentenced Lightfoot to 5 years' imprisonment and a \$5,000 fine. If this type of conviction is upheld by higher federal courts, to which he has appealed, mere membership in the party will be sufficient grounds for prosecution of an individual by the government, which heretofore has concentrated on indicting party leaders.

Also on February 15, the Subversive Activities Control Board ruled that the Labor Youth League is a Communist-front organization led by known Communists. Thus, according to the Subversive Activities Control Act of 1950, the league must announce its list of officers and reveal its finances to the Department of Justice. Also, no league member can work in the government or a defense plant, or obtain a passport to travel abroad. The league must now stamp its mail with a notation that it is a Communist organization. This is the first Communist front ordered to reveal itself by the Subversive Activities Control Board. The league refused to comply, and appealed the board decision to the federal courts.

In February and March 1955, seven national Communist leaders² were released from federal penitentiaries, after serving 5-year sentences for advocating sedition. All but two (Benjamin Davis, Jr., who was taken to Philadelphia to serve a 60-day sentence for contempt of court in an earlier trial; and Irving Potash, who was given permission to leave the country) were promptly rearrested and indicted for membership in a Communist Party which they knew to be seditious (the same charge on which Lightfoot had been convicted).

On April 21, a federal district court in North Carolina convicted Junius Irving Scales for membership in a Communist Party which he knew to be seditious. He had been a party leader in Tennessee and the Carolinas.

In the late spring of 1955, however, the Communist Party was successful in one legal battle. On April 22, a federal judge in New York ordered the retrial of secondary Communist leaders Alexander Trachtenberg and George Blake Charney, on the grounds that they had been convicted for advocating sedition on perjured testimony of Harvey M. Matusow, an ex-Communist who turned government witness, then later denied he had told the truth in court. Matusow subsequently appealed his own conviction for perjury by a Texas state court.

On June 20, a federal district court in Philadelphia convicted the following Communist lead-

sedition range from a year and a day of imprisonment plus a \$2,000 fine to 3 years' imprisonment and a \$6,000 fine.

¹ These 13 Communists are: Elizabeth Gurley Flynn, Pettis Perry, Claudia Jones, Alexander Bittelman, Alexander Trachtenberg, Victor Jeremy Jerome, Albert Francis Lannon, Arnold Samuel Johnson, Betty Gannett, Jacob Mindel, William Wolf Weinstone, George Blake Charney, and Louis Weinstock. Their sentences for

² These seven and their former party posts are: Irving Potash (national committeeman), John B. Williamson (national labor secretary), Jacob A. Stachel (educational director), John Gates (*Daily Worker* editor), Eugene Dennis (secretary general), Carl Winter (Michigan state chairman), and Benjamin Davis, Jr. (national committeeman). Potash agreed to deportation to Poland (he sailed on March 4), and Williamson to Britain (May 4), rather than face retrial; both were immigrants who had never become United States citizens.

ers of western Pennsylvania for advocating sedition: Sam Gobeloff (also known as Joseph Roberts), Joseph Kuzma, David Dubensky (David Davis), Thomas Nabried, Sherman Marion Labovitz, Walter Lowenfels (William Lerner), Irvin Katz, Robert Klonsky (Robert Kirby), and Benjamin Weiss. The first four received sentences of 3 years' imprisonment, and the remaining five, prison terms of 2 years.

With these convictions, the United States government since 1949 had convicted 89 national and local leaders of the Communist Party for advocating sedition or for Communist Party membership. Forty-one other Communists were awaiting trial on similar charges.

On July 1, 1955, the Subversive Activities Control Board ruled that the Jefferson School of Social Science in New York City was a Communist front, and ordered it to reveal its officers and finances to the Justice Department. The board stated that this school had trained Communists in subversive tactics.

On July 29, an old court case involving communism was finally settled. A federal judge in California ruled that the United States government had failed to prove Harry R. Bridges, a longshoreman union leader on the Pacific coast, to be a Communist.

In the same month, the Internal Security Committee of the U.S. Senate declared that the following five labor unions in the United States are dominated by Communists: International Union of Mine, Mill and Smelter Workers; United Electrical, Radio and Machine Workers; International Fur and Leather Workers; International Longshoremen's and Warehousemen's Union; and the American Communications Association. The committee requested the Subversive Activities Control Board to rule that these unions are Communist-front organizations.

In August the Un-American Activities Committee of the U.S. House of Representatives held hearings in New York City to investigate alleged Communist infiltration into radio, television, and theatrical entertainment. Of the 23 witnesses called and questioned about possible past membership in the Communist Party, 13 actors, 2 musicians, 2 producers, 2 theatrical press agents, 1 singer, 1 artist, and 1 stage manager refused to answer the committee's questions. One witness, an actor, admitted he formerly was a Communist.

COMMUNITY CHESTS. See Index entries, *Community Chests* and *Community Chests and Councils of America, Inc.*

COMMUNITY TRUSTS. Community trusts are administrative media for the application of multiple charitable funds, each managed unit retaining its separate identity within the group. A distinguishing feature of these trusts is their power to amend the uses for which particular funds may be employed if, in changing conditions, originally designated charitable purposes become obsolete.

The aggregate resources of community trusts in the United States and Canada rose to \$141,-276,907 at the beginning of 1955 from \$127,-395,738 a year earlier. Holdings of some of the larger community foundations include: New York

Community Trust, \$24,508,837; Cleveland Foundation, \$18,309,356; Boston Permanent Charity Fund, \$13,633,839; Chicago Community Trust, \$12,133,225; and California Community Foundation, Los Angeles, \$9,521,235.

Grants of these composite charitable foundations aggregated \$6,099,181 in 1954, compared with \$5,761,506 in 1953. Among community trusts making the largest disbursements were those in New York, with outpayments of \$1,140,-977; Cleveland, \$746,490; Chicago, \$639,753; and Boston, \$598,863. Funds newly received by community trusts in 1954 totaled, in Indianapolis, \$3,070,140; in New Haven, \$2,098,997; in Hartford, \$1,821,676; and in Winston-Salem, \$1,127,-673.

A total of 1,256 separate funds were under administration by community trusts in 1954, compared with 1,198 a year earlier. Winnipeg had 113 of these; New York, 105; Rochester, 99; Cleveland, 68; Winston-Salem, 67; and Buffalo, 59. Upward of 87 per cent of the reported resources of community trusts are already in hand, the remainder being deferred pending the completion of current "life uses."

RALPH HAYES,

Director, The New York Community Trust.

COMORO ISLANDS. A French territory comprising four main islands (Grande Comore, Mayotte, Anjouan, and Mohéli) and several islets, situated between Africa and Madagascar. Area, 834 square miles (of which Grande Comore comprises 444); pop. (est. 1954), 169,000, including 889 nonindigenous persons, mainly French. The natives are Moslems of mixed Arab, Makwa, and Malagasy descent. Dzaoudzi (3,000), on Mayotte, is the capital. The French superior administrator is aided by a nominated privy council and a 24-member elected general council. The 1954 budget totaled 393 million francs CFA. In 1953 there were 32 primary schools (2,494 pupils); 1 secondary school (109); and 3 technical schools (95).

Food crops are chiefly manioc, corn, bananas, and rice. Chief cash crops and 1954 exports (in metric tons) were: vanilla, 82; essential oils (ilang-ilang and lemon-grass), 34; copra, 1,599; and sisal, 2,134. Industry consists of a coconut oil refinery, a sugar refinery, an essence distillery, and a few sisal and soap factories. Exports in 1954 totaled 558.8 million francs CFA (of which vanilla accounted for 260.9 million); imports, 559.9 million. The road network totaled 268 miles in 1953.

CONCILIATION SERVICE, U.S. See FEDERAL MEDIATION AND CONCILIATION SERVICE.

CONFECTIONERY. Sales of confectionery and competitive chocolate products in the United States were estimated at \$978,649,000 in 1954, compared with \$978,780,000 in 1953, according to the Bureau of the Census, U.S. Department of Commerce; sales in the first 10 months of 1955 were estimated at \$780,063,000. A selected group of large-scale manufacturer-wholesalers and chocolate manufacturers, reporting their sales for the first 10 months of 1955 to the Bureau of the Census, sold 961,454,000 pounds of confectionery valued at \$376,574,000. Of this total, packaged goods made to retail at \$1 or more per pound amounted to 25,845,000 pounds valued at \$28,-319,000; packaged goods made to retail at 50 cents to 99 cents per pound, 92,189,000 pounds valued at \$49,805,000; packaged goods made to retail at less than 50 cents per pound, 150,785,-

000 pounds valued at \$39,174,000; bar goods, 435,407,000 pounds valued at \$182,262,000; bulk goods, 167,267,000 pounds valued at \$42,523,000; and 5- and 10-cent specialties, 89,961,000 pounds valued at \$34,671,000.

CONGO, Belgian. See **BELGIAN CONGO.**

CONGREGATIONAL CHRISTIAN CHURCHES. The Congregational Christian Churches includes the Congregational Churches, established at Plymouth, Mass., in 1620, and the Christian Church, established in Virginia, Ohio, and New England in the Revolutionary War period. The two denominations united in 1931. Currently the united church is planning a further merger with the Evangelical and Reformed Church. Approval of this action is expected at a meeting of the Congregational Christian Churches in Omaha, Nebr., in June 1956, and the actual merger is expected a year later. The new denomination will be known as the United Church of Christ.

During 1955 the denomination worked to complete the raising of \$5 million for assisting in the building of much-needed new churches. To meet the need for new pastors, a carefully planned recruiting program has been developed by the denomination's Department of the Ministry. More students have been enrolled in the various seminaries than for many years. The church schools are also in need of additional teachers, and the Educational Division of the Board of Home Missions has greatly widened its program of recruiting and training church school teachers and educational directors.

Statistics for 1954: number of churches, 5,536, organized in 39 conferences; church membership, 1,310,572 (gain of 26,818 during the year); membership in church school and other study groups, 743,532; number of ministers, 5,879 (including 3,346 pastors and 91 chaplains); legacies, \$3,700,977, received by 832 churches; contributions of churches for home expenses, \$43,024,538; contributions for benevolences, \$9,525,437; total value of church property, \$437,888,284.

CONGRESS OF INDUSTRIAL ORGANIZATIONS. Under the leadership of President Walter P. Reuther, the CIO made steady progress during 1955 as it worked to complete plans for a merger with the American Federation of Labor (q.v.).

The merger, creating a 15-million member organization called the American Federation of Labor and Congress of Industrial Organizations, succeeded on December 5 in bringing to an end a 20-year split in the ranks of organized labor in the United States. Following the signing of the merger agreement at Miami Beach, Fla., on Feb. 9, 1955, CIO leaders devoted much of their attention to working out procedural and technical details of the merger and agreeing upon policies and principles for the new organization.

In May the AFL-CIO Unity Committee, headed by AFL President George Meany and CIO President Walter Reuther, agreed upon a

new constitution for the merged AFL-CIO, which they said would bring about "honorable, organic labor unity," which "will contribute to the strength and effectiveness of the trade union movement . . ." and "will materially benefit the entire nation. . . ."

The CIO met in its final convention at New York City on Dec. 1-2, 1955, and the merger was completed at a convention of delegates from CIO and AFL unions in New York starting December 5. Under the merger agreement, it was stipulated that AFL President Meany and AFL Secretary-Treasurer William Schnitzler would be unopposed, and they were thus elected to similar offices in the newly formed AFL-CIO.

During 1955 the affiliated unions of CIO made substantial progress in collective bargaining. For the first time the principle of Guaranteed Annual Wages (GAW) was incorporated into contracts covering up to a million workers.

The CIO United Automobile Workers, in negotiations with the Ford Motor Company (June 6), General Motors (June 16), and other auto manufacturers, achieved acceptance of the GAW principle through a guarantee of partial wages for unemployed workers for a maximum of half a year. Elsewhere at the collective bargaining table, the CIO United Steelworkers of America achieved a 15-cent-an-hour wage increase. The steel contracts were open only for a discussion of wages, but the union made it clear that it would seek the GAW in 1956. Underscoring that determination, the steelworkers won a full GAW contract from the American Can and Continental Can companies on August 13.

The International Union of Electrical Workers, CIO, won a 40-cent hourly raise to be achieved during a five-year contract with General Electric, while the Rubber Workers and other CIO affiliates scored impressive victories. The CIO National Maritime Union, in an industry beset by layoffs, also achieved supplemental unemployment compensation for the first time in history.

During 1955 the CIO waged an active fight for a number of important progressive legislative proposals. Much energy went into the successful campaign to amend the Fair Labor Standards Act by raising minimum wages and extending the act's protection.

The CIO played a prominent role at the Vienna meeting (May 20-28) of the International Confederation of Free Trade Unions (q.v.) and at the Geneva sessions (June 1-23) of the International Labor Organization (q.v.). CIO representatives were also active at the Geneva atoms-for-peace conference; and the congressional Atomic Energy Committee named CIO President Reuther as a public adviser on atomic energy policies.

Throughout 1955 the CIO continued to sponsor a nightly radio news commentary, featuring John W. Vandercook, over the American Broadcasting Company network. The CIO Community Services Committee was unusually active during 1955. Following the late summer floods in the Northeast, caused by Hurricane Diane, the CIO established a special Flood Relief Committee and raised more than \$300,000 from its members for distribution to welfare organizations in the flood-stricken areas.

The CIO maintained headquarters at 718 Jackson Place, NW, Washington 6, D.C. (See also **AUTOMOBILES**; **IRON AND STEEL**; **LABOR**.)

JAMES B. CAREY,
Secretary-Treasurer, CIO.

CONNECTICUT

CONNECTICUT. New England state, United States; one of the original 13 states. The "Nutmeg State" ranks 46th in area and 25th in population (1955) among the 48 states.

Area and Population.—Area: 5,009 square miles (land, 4,899; inland water, 110), divided into 8 counties. Population: (1950) 2,007,280; (est., July 1, 1955) 2,233,000. Towns (defining civil divisions) and urban places (in some instances coextensive with and hence also designated as towns) with 1950 populations above 10,000 are as follows:

Ansonia.....	18,706	New Haven.....	164,443
Bradford town.....	10,944	New London.....	30,551
Bridgeport.....	158,709	Norwalk.....	49,460
Bristol.....	35,961	Norwich.....	61,062
Danbury town.....	30,337	Shelton.....	12,694
Danbury city.....	22,067	Southington town..	13,061
Darien town.....	11,767	Stamford.....	74,293
Derby.....	10,259	Stonington town.....	11,801
East Hartford town..	29,933	Stratford town.....	33,428
East Haven town.....	12,212	Torrington.....	27,820
Enfield town.....	15,464	Vernon town.....	10,115
Fairfield town.....	30,489	Wallingford town..	16,976
Greenwich town.....	40,835	Wallingford boro..	11,994
Groton town.....	21,896	Waterbury.....	104,477
Hamden town.....	29,715	Watertown town.....	10,699
Hartford (capital)...	177,397	West Hartford town..	44,402
Killingly town.....	10,015	West Haven town.....	32,010
Manchester town.....	34,116	Westport town.....	11,667
Mansfield town.....	10,008	Wethersfield town..	12,533
Meriden.....	44,088	Willimantic.....	13,586
Middletown.....	29,711	Winchester town.....	10,535
Milford town.....	26,870	Windham town.....	15,884
Naugatuck.....	17,455	Windsor town.....	11,833
New Britain.....	73,726		

¹ Norwich town and city consolidated, July 18, 1955; pop. shown, 1950.

Executive.—Chief state officers in 1955:

Governor: Abraham A. Ribicoff (Democrat)

Lieutenant Governor: Charles W. Jewett

Secretary of State: Mildred P. Allen

Treasurer: John Ottaviano, Jr.

Attorney General: John J. Bracken

Commissioner, State Board of Education: Finis E. Engleman

Constitution and Judiciary.—The present constitution went into effect in 1818. The highest tribunal, the Supreme Court of Errors, comprises five justices; chief justice in 1955 was Ernest A. Inglis.

Legislature.—The General Assembly (Senate, 36 members; House of Representatives, 279) meets in odd-numbered years commencing the first Wednesday after the first Monday of January.

The regular biennial session met on Jan. 5, 1955, amid a political situation in which the governor was a Democrat and all other major elective officials were Republican and in which the Senate was Democratic, 20 to 16, and the House was Republican, 185 to 94. The regular session adjourned in some confusion on June 8 without having passed essential tax measures. Consequently the governor called a special session for June 22 which adjourned June 24.

Three proposed constitutional amendments were adopted for action at the next session. Two would relieve the legislature of many local bills by giving towns a greater measure of home rule, and the third provides for budget sessions of the General Assembly in even-numbered years.

A biennial appropriation of \$332,890,000 from general funds was approved, the largest on record. State aid to towns for education, estimated at \$19 million, was increased by \$21 per pupil. A Hartford Bridge Authority was established to build five new bridges across the Connecticut River in the Hartford area. A \$20 million bond issue was authorized to provide a bonus for Korean War veterans. Raffles and bazaars for nonprofit organizations under local option were legalized. Other appropriations totaling many millions of dollars were approved for additions to the humane and welfare institutions and the state university, and for the building of a new Hartford Regional Technical School and a new state prison in Enfield.

To finance these expenditures, including the extensive highway program, the 3% sales and use tax was continued for the biennium, the gasoline tax was raised from 4 to 6 cents per gallon, fees on toll roads were increased, and the 3½% corporation business tax and the unincorporated business tax were continued.

At a second special session called by the governor for November 9, agreement was reached by political leaders on December 15 for temporary tax increases to finance a flood-relief program of \$36,453,000.

Finances.—State treasury receipts (1954-55 fiscal year): \$1,088,198,723.54; expenditures, \$1,088,125,575.74; treasury balance, \$26,811,719.14; long-term indebtedness, \$207,545,000.

Taxation.—State tax revenue (1954-55 fiscal year): \$164,046,738.06, including \$93,229,474.81 from a 3%

general sales tax and selective sales and gross receipts taxes; \$16,178,571.73 from licensing; and \$23,216,777.58 from corporate income taxes. The state has no individual income, property, or poll taxes.

Banking.—As of June 30, 1955, the state's 41 national banks had \$1,115,235,000 in assets, \$803,304,000 in demand deposits, and \$218,552,000 in time deposits; the state's 134 other banks had \$3,094,756,421 in assets, \$2,065,636,157 in demand deposits, and \$715,457,890 in time deposits.

Education.—School attendance is compulsory for all between the ages of 7 and 16, inclusive. Operating expenditures for the 1953-54 school year totaled \$91,086,059 (\$256.36 per pupil) for public elementary and secondary education, consisting of \$75,402,180 from local school districts and \$15,683,879 from the state. Expenditures for construction and improvements totaled \$28,774,899. Teachers' salaries averaged \$4,093 (elementary school teachers, \$3,940; high school teachers, \$4,403).

CONNECTICUT SCHOOL STATISTICS, 1953-54

Type of school	No.	Teachers	Students
Public elementary (k-6 or k-8)...	729	8,710	268,524

Rehabilitation facilities for chronically ill, aged, and infirm.....	2	301

* Including prison farms.

Labor Force.—The labor force in June 1955 numbered 1,040,200, including 37,000 agricultural workers. Nonagricultural employment of wage and salary workers totaled 855,700 in June 1955, and for the 12 months ending in June 1955 averaged 852,000. There were 30,700 unemployed workers in June 1955, not including 8,700 involved in labor-management disputes. A total of \$35,400,490 in unemployment insurance claims was paid to workers during 1954.

Manufacturing.—Establishments numbering 4,327 had 417,107 employees in 1954, and paid \$1,754,385,000 in salaries and wages, as compared with \$1,914,279,000 to 457,583 employees in 1953. Value added by manufacture in 1953 was \$3,192,556,000; investment in new plant and equipment totaled \$134,353,000. Earnings of production workers in manufacturing averaged \$72.76 for an average work week of 40.2 hours in 1954, and \$77.19 for 41.5 hours in the first six months of 1955.

Fisheries.—The commercial fish and shellfish catch in 1953 was valued at \$1,276,000 for 17,482,000 pounds, including \$319,932 for 71,831 bushels of oysters. In 1954, 2,620 persons were engaged in Connecticut's commercial fisheries.

Agriculture.—Cash farm income in the first half of 1955 totaled \$86,921,000, and for the full year 1954 comprised \$111,009,000 from livestock and livestock products, \$57,224,000 from crops, and \$398,000 from government payments.

In 1954, receipts from principal livestock categories included: dairy products (\$42,818,000), eggs (\$29,710,000), and broilers (\$21,324,000).

The state's 12,753 farms (1,137,894 acres; harvested cropland, 285,886) had 89.2 acres and a value in land and buildings of \$23,670 per farm in 1954. Some 11,882 farms had telephones and 12,579 had electricity. Livestock on farms on Jan. 1, 1955, included 188,000 cattle and 4,632,000 chickens (not including commercial broilers). During the week of Sept. 26–Oct. 2, 1954, there were 30,657 family and hired workers engaged in farming.

Transportation and Communications.—State and federal funds disbursed for roads and highways

WIDE WORLD

Smoldering ruins of magnesium plant at Putnam, Conn., destroyed by fire and flood on Aug. 19, 1955.

in the 1954–55 fiscal year totaled \$32,870,000, and newly completed construction of state highways in 1954 aggregated 10.3 miles.

Highways and roads on Dec. 31, 1954, totaled 15,251 miles (13,454.6 surfaced). Registered motor vehicles numbered 874,724 on June 30, 1955, including 721,560 passenger cars. There were 3 railroads (1954) operating 830.85 line miles, and (1955) 4 regularly scheduled airlines and 67 airports and airfields (21 commercial and municipal and 26 private fields; 7 heliports; and 6 commercial and 7 private seaplane bases).

Communications media (1955) included 25 AM and 6 FM radio stations and 5 operating television outlets (4 UHF and 1 VHF); 25 daily newspapers (circulation, 566,931) and 65 other newspapers; and (Jan. 1, 1955) 267,251 business and 698,961 residential telephones.

Principal Events, 1955.—On August 19, Hurricane Diane caused floods throughout the state which brought about the worst disaster in its history. The hurricane itself caused little damage, but the torrential rains wrought devastation. Small streams in the northeastern, north central, and northwestern areas became raging torrents with the approximately 16 inches of rain which fell on the 18th and 19th. Over 250 factories in the heavily industrialized Naugatuck Valley were temporarily paralyzed. The cities in that section

Receding waters of raging Mad River left chaos along Main Street, Winsted, Conn., following flood in August 1955.

WIDE WORLD

suffering greatest losses were Waterbury, Winsted, Naugatuck, Ansonia, and Torrington. In the eastern part of the state the rampaging Quinebaug River caused heavy loss. Governor Ribicoff immediately called on President Eisenhower to declare Connecticut a disaster area. The president at once complied and flew from Denver, Colo., to Windsor Locks, where on August 23 he conferred with the governors of six states affected by the floods.

The state was struck by a new flood on October 15 and 16. Heavy rains again caused rivers to overflow in 39 communities, 28 of which had escaped the first flood. Stamford and Norwalk were the chief sufferers, and Waterbury, Naugatuck, Ansonia, Derby, and Danbury were hit a second time. The toll of the two floods included 91 persons known dead, 12 missing, 86,000 unemployed, over 1,100 families homeless, 2,300 families temporarily without shelter, and the homes of nearly 20,000 families suffering flood damage. The Connecticut Flood Recovery Committee listed the total damage of the first flood as \$202,800,000 and the damage from the second flood at about one tenth of this total.

On July 21 the second atomic submarine, the *Seawolf*, was launched at Groton. Immediately afterward the keel of a third nuclear-powered submarine was laid.

A distinguished audience attended the opening of the American Shakespeare Festival Theatre and Academy at Stratford on July 12. The octagonally shaped theater, costing about \$1 million, opened with a two-week run of *Julius Caesar*.

As of Dec. 19, 1955, 650 cases of poliomyelitis had been reported, with 19 deaths, but there had been no deaths and only 10 cases of very mild paralysis among the 116,000 children who had received the Salk vaccine.

On November 8 the Connecticut General Life Insurance Company announced the purchase of the National Fire Insurance Company in a stock exchange deal involving about \$80 million.

State Librarian, Connecticut State Library.

CONSERVATION. See FORESTRY; SOIL CONSERVATION; and Index entry, *Conservation*.

CONSTRUCTION. See ARCHITECTURE; BUILDING AND CONSTRUCTION; HOUSING.

CONSUMER CREDIT. During the first three quarters of 1955, consumer credit in the United States was increased by approximately \$4.2 billion. This increase brought the total of such credit to a record high for the postwar period of \$34.3 billion—an increase of about 14% from the level at the end of 1954.* A moderate decline in consumer credit outstanding occurred in the first two months of the year, but thereafter it steadily increased. Although consumer credit declined more than a half billion dollars in 1954, it increased at an average rate of more than \$2 billion during the previous postwar years.

The significance of changes in consumer credit must be judged in relation to other variations in the economy. One of the most important

* The consumer credit statistics published in the monthly *Federal Reserve Bulletin* include short and intermediate credit extended to consumers through regular business channels—commercial banks, other financial institutions, retail stores and service establishments. Although the consumer credit concept logically includes real estate mortgage credit on owner-occupied houses, this kind of credit is usually long-term and traditionally has been excluded from consumer credit. Statistics of this kind of credit are also published in the *Federal Reserve Bulletin*.

variables to be considered is disposable personal income, which has also increased in the postwar years. In the two years prior to 1942, consumer credit was about 11% of disposable personal income; in September 1955 it was about 12%—a record high for the postwar period.

This increase in consumer credit in 1955, and the substantial increase in long-term mortgage debt on houses (the total outstanding for both in September was about \$120 billion) were largely responsible for the government's anti-inflationary measures in the latter part of the year (for example, higher interest rates of the Federal Reserve banks, less liberal extension of credit to veterans as house-buyers, and severe restriction of credit by the Federal Home Loan Bank to savings and loan associations). For the first time since the end of 1953, new contracts for residential construction were lower in September 1955 than in the same month of the previous year.

Consumer credit, expanded mainly by the increase in installment credit for purchasing automobiles, showed little tendency to decline in the third quarter of the year. However, in order to meet outstanding obligations, consumers were expected to save more and to spend less in 1956.

Status of Consumer Credit, December 1954.—At the end of December 1954, the major portion of the \$30.1 billion of consumer credit was installment credit, namely, \$22.5 billion. It consisted of \$10.4 billion of installment sale credit on automobiles provided by sales finance companies, commercial banks, and automobile dealers. Installment credit for other consumer goods, secured by the items purchased, amounted to \$5.7 billion and was provided by commercial banks, department stores, mail-order houses, furniture stores, and other retail outlets. Repair and modernization installment loans for owner-occupied dwellings totaled \$1.6 billion, which was extended mainly by commercial banks. Other personal loans of an installment type totaled \$4.8 billion, which was granted mainly by commercial banks and other financial institutions.

The minor portion of the \$30.1 billion of consumer credit was noninstallment credit, namely, \$7.6 billion. It consisted of \$2.4 billion of single-payment loans, extended mainly by commercial banks. Charge accounts at stores amounted to \$3.5 billion. Service credit, the amount owed by individuals to professional practitioners and service establishments, totaled \$1.7 billion.

Trend in Consumer Credit, 1955.—At the end of September 1955, consumer credit had increased from the December 1954 level by approximately \$4.2 billion, or 14%; installment credit increased about 18%, and noninstallment credit decreased about 1%. Of the four groups constituting installment credit, automobile credit increased 33%; other durable goods credit and repair and modernization loans remained practically unchanged; and personal loans increased about 10%. In terms of the sources supplying the increase in installment credit during the first three quarters of 1955, the sales finance companies and commercial banks (the major suppliers of installment credit) were the main ones, with increases of 36% and 17%, respectively.

Of the three groups constituting noninstallment credit, single-payment loans during the first three quarters increased about 10%; charge accounts decreased about 11%; and service credit increased about 6%. Commercial banks were the source of the increase in single-payment loans.

The most important changes in the foregoing analysis of consumer credit were the spectacular

increases in installment credit for the purchase of automobiles and the relative stability of noninstallment credit. These changes were largely the result of an increase in disposable personal income, an increase in spending relative to saving, and an increase in demand for consumer durable goods (particularly automobiles). Because of the favorable change in economic conditions in 1955, the increase in demand for automobiles, and the maintenance of demand for housing facilities, consumer credit was substantially increased. However, consumer expenditures were being restrained by the government's restriction of credit; and the probability of more saving and less spending in order to meet past debt obligations, together with a decrease in demand for automobiles relative to other consumer goods, were expected to lower the level of consumer credit in 1956. CONTRACT BRIDGE. See SPORTS, GAMES, AND SHOWS.

COOPERATIVES. United States.—Cooperatives in the United States have kept pace with the nation's growing economy, and are continuing to handle about 2% of the retail trade. A study made by the Cooperative League of the USA, a national federation of consumer, service, and purchasing cooperatives, shows that the number of consumer and farm supply cooperatives has slowly dwindled since World War II, but that more people have joined existing cooperatives. Combined sales have jumped 20%. In 1954, retail sales approached \$3 billion; wholesale sales stood at more than \$800 million.

Cooperatives are groups of people organized together to provide goods and services for themselves at cost.* More than 12 million families in the United States share ownerships in these non-profit enterprises.

The year 1954 was a year of expansion for many cooperatives. The largest consumer cooperative in the United States opened a million-dollar food and variety-drug store on the outskirts of Washington, D.C. Other operations were expanded in Falls Church, Va., Natick, Mass., Chicago, Stafford Springs, Conn., Ridgewood, N.J., and Palo Alto, Calif.

Farm cooperatives market about one fifth of United States farm products. Two thirds of all farmers are members who own and control these facilities. Latest available figures show that in 1953, 7.5 million memberships were held by 3 million farmers. Marketing cooperatives handled about \$7.5 billion worth of products. Farm supply (or purchasing) groups sold farmers \$2 billion worth of merchandise, seed, feed, fertilizer, and oil. Rural electric cooperatives were serving 4 million members with \$400 million worth of electricity.

Probably the nation's best-known cooperative is CARE, popular name for the Cooperative for

American Remittances to Everywhere, which provides a means for Americans to send food, clothing, and other specialized packages to stricken countries abroad.

Canada.—A cooperative credit society organized to serve banking needs of cooperatives throughout the Dominion, and the merger of Manitoba and Saskatchewan cooperatives highlighted the progress of these self-help groups in 1954. Preliminary government figures provided by the Cooperative Union, the federation of Dominion cooperatives, indicate that sales of all cooperatives topped \$1 billion. The number of member-families exceeded 1½ million. A possible pattern for future consumer goods distribution was developed by the Regina (Sask.) society, which planned to open a larger supermarket and variety store in the downtown section early in 1955. Planned as a two-level store, it was to be the largest consumer cooperative store in Canada and possibly in North America.

Most of Canada's cooperatives are rural, and perform both marketing and purchasing services for members. There were more than 2,000 of these in 1954. Marketing was responsible for about three fourths of the total business. Eighty-six fishermen's cooperatives handled more than \$17 million in business, while service cooperatives did another \$12 million in sales.

Great Britain.—Cooperatives continued to operate about two thirds of the self-service shops in Great Britain. Membership gained more than a quarter-million in 1954 to a record high of about 11.5 million. Total retail sales jumped to £793 million, due partly to price increases and partly to greater sales. Twelve cooperative societies had more than 100,000 members, and 30 cooperatives had between 50,000 and 100,000 members. Greatest gains for the year were shown in Scotland, both for membership and sales.

Other Countries.—Sweden's consumer cooperatives led in the number of supermarkets. In 1954 they opened 307 such outlets for a total of 1,140. Membership stood at more than 1 million, with sales of \$500 million. In France, consumer cooperatives opened 200 new shops in 1954. All 880 French societies had retail sales of \$365 million and membership of 2.7 million.

The International Cooperative Alliance, worldwide federation of cooperatives, claimed a total 1954 membership of 117 million in 35 countries.

JACK T. JENNINGS,

Cooperative League of the USA.

COPPER. Figures compiled by the U.S. Bureau of Mines for production of copper (smelter output) in the world and in the United States are shown in the following table (in thousands of metric tons).

Year	World	U.S.	% in U.S.	Year	World	U.S.	% in U.S.
1945	2,165	701.1	32.4	1950	2,645	914.9	34.6
1946	1,860	552.2	29.7	1951	2,800	940.4	33.6
1947	2,260	857.0	37.9	1952	2,815	929.3	33.0
1948	2,340	839.6	35.9	1953	2,970	950.6	32.0
1949	2,360	779.8	33.0	1954	2,970	858.1	28.9

United States.—Mine production of recoverable copper was 926,448 short tons in 1953, 836,251 in 1954, and 630,010 in the first 8 months of 1955 (542,300 tons for the same period of 1954). The corresponding figures for smelter output were 1,047,810, 945,899, and 686,452 tons, respectively. Refinery output was 1,293,117 tons in 1953, 1,211,919 in 1954, and 826,361 during the first 8 months of 1955. Secondary recoveries

* In the United States, cooperatives include consumer retail and service cooperatives, farm purchasing and marketing cooperatives, telephone and electric cooperatives, and mutual insurance companies which operate on cooperative principles. Farm loan cooperatives and credit unions are also included. Through cooperatives, Americans also own oil wells, radio stations, flour mills, paint plants, coffee roasting establishments, and chick hatcheries. Other cooperatives provide educational services, compound drugs and medicines, market handicrafts, and handle travel abroad. Still others furnish low-cost burials, housing, hospital care, and insurance.

from old scrap added 429,388 tons in 1953 and 422,000 tons in 1954.

Total imports dropped from 677,069 tons in 1953 to 590,274 in 1954, and imports of refined copper in these respective totals declined from 274,777 tons in 1953 to 215,047 tons in 1954. Exports of refined copper (bars and ingots) increased from 109,510 tons in 1953 to 215,952 in 1954. Total consumption of refined copper declined from 1,494,215 tons in 1953 to 1,251,398 in 1954 (935,370 tons during the first 8 months of 1955).

Canada.—Primary copper production reached 183,180 tons in the first 6 months of 1955, as compared with 170,858 tons in the same period of 1954 (302,732 tons in the full year 1954). Corresponding figures for refined copper were, respectively, 159,802, 138,381, and 252,643. Exports through July 1955 were 21,680 tons of copper content in ore concentrates and matte, and 83,691 tons in ingots, bars, and billets. Consumption of refined copper in the first half of 1955 was 80,511 tons, as compared with 54,714 tons in the same period of 1954 (102,536 tons in the full year 1954). (See MINERAL PRODUCTION for output of major countries.)

OLIVER BOWLES, *Former Chief, Nonmetals Division, U.S. Bureau of Mines*; and BERENICE B. MITCHELL, *Foreign Minerals Staff, U.S. Bureau of Mines.*

COPYRIGHTS. The outstanding copyright event during the past year was the coming into force of the Universal Copyright Convention on Sept. 16, 1955, among the following countries: Andorra, Cambodia, Chile, Costa Rica, German Federal Republic, Haiti, Israel, Laos, Monaco, Pakistan, Spain, and the United States. The convention also came into force in Luxembourg, the Holy See, and the Philippines later in the year, and indications were that a number of additional countries would ratify in 1956.

The amendment to the United States copyright law implementing this convention also became effective on Sept. 16, 1955. Foreign authors and composers who are nationals of countries adhering to the Universal Copyright Convention or whose works are first published in such countries, are now entitled to the protection of the United States copyright law if at the time of first publication of their works a simple form of notice ("© 1955, John Doe") appears on the work in such manner and location as to give reasonable notice of copyright. Formalities of the domestic law, such as manufacture of English-language books in the United States and registration are waived as to such works. American authors who first publish their works with the same form of notice in the United States likewise receive the automatic protection of the law of the contracting states without formalities.

Considerable interest manifested itself during the year in a complete revision of the nearly 50-year-old United States copyright law. Bills were introduced in Congress (H.R. 2677 and H.R. 5366) to establish a presidential commission to study the problem and make recommendations, but neither bill was actively considered.

Preliminary steps were taken during the year toward the creation of a new law to protect useful designs. In January 1955 a Design Coordinating Committee appointed by the National Council of Patent Law Associations met in Washington to consider the form and content of a proposed bill to accomplish this purpose.

The annual report of the register of copyrights reveals that registrations during the fiscal year 1955 were at an all time high, as follows:

Books:	
(a) Printed in the United States:	
Books proper, pamphlets, leaflets, etc.....	49,142

Contributions to newspapers and periodicals..	3,746
Total.....	52,888

CORN. See AGRICULTURE; GRAINS.

CORSICA (Fr. CORSE). An island in the Mediterranean about 100 miles southeast of France, of which it is a department. Area, 3,367 square miles; pop. (1954 census), 246,995, a decline of 23.5% since 1936. Ajaccio (32,997) is the capital. Corsicans speak an Italian dialect. Exports include wine, olive oil, timber, and asbestos.

COSMIC RAYS. See Index entry.

COST OF LIVING. The general level of prices in 1955 remained stable in the United States, as in the two previous years. The cost of living as measured by certain retail prices continued practically unchanged during the first half of the year, but fluctuated moderately during the second half with a slight tendency to increase. Wholesale prices on the average fluctuated fractionally during the first half of the year, and increased slightly in the second half.

Although many prices remained practically unchanged during the year, general stability resulted in part from some moving upward and others downward. Wholesale prices, for example, of farm products and processed foods declined moderately, but those of a majority of industrial products increased, and only the prices of a few groups declined. Retail prices of consumer goods and services tended to remain unchanged or to increase slightly; only a few groups showed slight price declines.

Demand for nearly all consumers' and producers' items was maintained or increased during the year. This resulted largely from an increase in employment and personal income. Also, disposable personal income (personal income minus personal taxes and related payments), which is available for spending and saving, increased, and the rate of personal saving declined. In addition to these changes, which maintained or increased the demand for many items, there was an increase in the use of consumer credit (see CONSUMER CREDIT).

On the supply side of market adjustments, changes in output offset many of the changes in demand without appreciable changes in prices. However, the exceptions were important. In the second half of the year, output reached a level in a number of industries which approximated capacity rates. Among these were steel and non-ferrous metals (for example, copper and aluminum), a few chemicals, and certain paper products. The pressure on steel capacity resulted mainly from the record rate of automobile pro-

duction, a boom in the construction industry, a high level of investment in plant and equipment, and heavy orders by fabricators of machine tools and freight cars. Although industries producing durable goods, paper, and rubber products increased their production capacity during the year, the shortage of skilled labor and higher wage rates indicated the continuation of moderate price increases of these items in 1956.

The other important exception was farm products. Domestic consumption of these products increased, but foreign demand declined. Government price supports for some of them were lowered slightly, and the prices of nearly all farm products declined moderately during the year. Output continued at very high levels, however, and the lack of adjustment in supply resulted in large carry-over stocks of feeds, food grains, cotton, oil seeds, and other crops. An important part of these stocks was acquired by the government's Commodity Credit Corporation (q.v.) in maintaining price supports for some farm products. Prices of farm products were not expected to increase in 1956. (See also AGRICULTURE.)

In view of the varying economic situation, an expansion of credit for stimulating production was encouraged early in the year by low interest rates of the Federal Reserve banks. (See also BANKING; FEDERAL RESERVE SYSTEM.) Later, these were raised, and the Federal Housing Administration and the Veterans Administration increased downpayments for house-buying and shortened the pay-off period for loans. These measures and others were expected to check inflationary increases in prices. Thus, the general level of prices was expected to remain relatively stable in 1956.

Consumer Price Index and Retail Prices.—Changes in the cost of living in the United States are measured by the Consumer Price Index, which is published by the Bureau of Labor Statistics of the Department of Labor. The index, revised as of January 1953, measures only changes in prices of the goods and services bought by a representative group in the population; it does not measure changes in the qualities and quantities of items purchased by this group.¹ The latter changes reflect a higher or lower level of living, not a higher or lower cost for the same

level of living. Similar indexes are prepared in other countries.

In the United States the cost of living remained practically unchanged in 1955 until July, when the index moved to 114.7, as compared with 114.3 in January. It declined in August, but increased again in September to 114.9. These changes in the index occurred primarily because of fluctuations in the retail prices of foods. The cost of living in September was 14.9% above the average for 1947–49, and less than one half of 1% below the peak of October 1953 (115.4).

In September 1955 the Consumer Price Index was only fractionally higher than in the previous September. Although the food component of the index fluctuated appreciably, its level in September 1955 was 0.7% lower than in the previous September, and 4.3% below its August 1952 peak. Retail prices of meats, poultry, and fish were appreciably lower; fruits and vegetables were approximately the same. Retail prices of cereals and bakery products, and of dairy products were slightly higher. The housing component of the index was about 0.8% higher in September 1955 than in the previous September. Payments for rent, gas and electricity, fuels, and household operations were higher; for housefurnishings, lower. Of the remaining components of the index, prices of apparel, reading and recreation, and miscellaneous items (tobacco, alcoholic beverages, and minor services) were slightly higher; those of medical and personal care, appreciably higher; those of transportation, slightly lower. The total index of consumer prices was not expected to change appreciably during the fourth quarter of 1955.

Consumer Price Indexes for Ten Large Cities.—

Prices of goods and services customarily purchased by city wage-earner and clerical-worker families are included in the general index. These are collected in 46 cities which are representative of all cities in the United States. Separate indexes are calculated for each of the 20 largest cities. Ten of these, for cities in which prices are ascertained in August, are presented in the accompanying table. Comparison of city indexes shows only that prices in one city changed more or less than in another. City indexes do not measure differences in price level or cost of living between cities.

CONSUMER PRICE INDEX FOR TEN LARGE CITIES, AUGUST 1955 AND 1954 (1947–49 = 100)

City	Aug. 1955	Aug. 1954	Percent change, 1954 to 1955
Chicago.....	118.5	117.7	0.7
Cleveland.....	116.0	115.3	0.6
Detroit.....	116.5	116.8	-0.3
Houston.....	115.5	116.5	-0.8
Los Angeles.....	115.5	115.1	0.3
New York.....	111.9	113.0	-1.0
Philadelphia.....	115.8	116.2	-0.3
Scranton.....	111.5	112.4	-0.8
Seattle.....	116.6	116.2	0.3
Washington, D.C.....	113.8	114.1	-0.3

(Source: U.S. Department of Labor, Bureau of Labor Statistics.)

Among the ten cities in the table, the greatest increase in the cost of living between 1947–49 and August 1955 occurred in Chicago, namely, 18.5%. It also had the greatest increase between August 1954 and August 1955, namely, 0.7%. The smallest increase in the cost of living, 1947–49 to August 1955, occurred in Scranton (11.5%). However, the greatest decrease in the cost of living between August 1954 and August 1955 (–1.0%) occurred in New York. (These

¹ The index shows average changes in retail prices of selected goods and services (about 300 items—87 foods; 78 articles of apparel; 70 housing items including rent, fuel, and housefurnishings; and 61 other items, mainly services) which are important in the purchases of city wage-earner and clerical-worker families. Since these moderate-income families spend more, for example, on food than on apparel, a change in the price of food is of greater importance or weight in the cost of living than an equal change in the price of apparel. Consequently, based on their importance in 1952 expenditures, the 87 foods of the index have about 30% of total weight, and the 78 apparel items about 10% (housing items, 32%; other items, about 28%). An average price change on foods, therefore, has about three times as much influence in the index as an equal change on apparel items. The moderate-income families for which the 300 consumer items constitute important expenditures represent about 64% of all people living in urban areas, and about 40% of the total United States population. Hence, changes in the index do not reflect accurately changes in the cost of living of families at the lowest and highest extremes of the income scale. The average level of prices of the 300 items, weighted as indicated above, for the three years, 1947–49, is called the base period and is designated as 100. Averages of prices for other periods can then be related proportionately to the base period of 100. This procedure enables price changes to be expressed conveniently in percentage terms with reference to the base period. Thus, an index of 115 means a 15% increase in the cost of living as compared with the average level of consumer prices in 1947–49; an index of 95 means a 5% decrease.

changes do not indicate that the cost of living in August 1954 and 1955 was higher in Chicago than in Scranton and New York.)

Wholesale Commodity Prices.—Prices in primary markets of agricultural products, of other basic raw materials, and of important manufactured goods show rather quickly the effects of variations in crop yields, in industrial wage rates, and in other fundamental conditions of income flow and governmental policy. They also frequently indicate the future movements of retail prices and the cost of living. Recent declines, however, in wholesale prices sometimes have had little effect on the Consumer Price Index. A few consumer prices may fall, but others continue to rise, particularly rent and services which are not directly included in the wholesale index. In the United States, the monthly Wholesale Price Index, published by the Bureau of Labor Statistics, includes prices of nearly 2,000 basic commodities.²

The general level of wholesale commodity prices in the United States moved irregularly, but slightly upward, during the first three quarters of 1955. In September 1955 the index for all commodities was 111.7, or 11.7% above the average for the base period (1947-49), which was slightly more than 1% above the level for September 1954. Since the peak of February and March 1951, wholesale prices have generally declined. The index of 111.7 in September 1955 was 4% below this peak.

Although the wholesale index increased moderately during 1955, a few important commodity groups in the index showed a price decline. Farm products in September 1955 were 4% lower in price than during the previous September; processed foods were also about 4% lower. In the latter group, meats were approximately 6% lower in price. The prices of industrial commodities in September 1955 were 3.5% higher than in the previous September. Hides and leather products, fuel and power, rubber products, lumber and wood products, pulp and paper products, metals and metal products, machinery and motive products, furniture and household durables, and structural nonmetallic minerals were higher in price; textiles and apparel, chemicals, tobacco products and bottled beverages, and miscellaneous commodities remained about the same or declined in price. No substantial changes in the level of wholesale prices were expected in 1956.

Canada.—Stability of postwar prices, achieved recently by many countries, was characteristic of some important industrial nations in 1955. In Canada the cost of living remained practically unchanged. Retail prices of clothing and household operations declined moderately. Prices of shelter increased moderately; those of foods, other commodities and services increased slightly. The index of wholesale prices increased during the year, and in September 1955 it was approximately 3% higher than in the previous September. The prices of farm products in the index decreased moderately; those of raw and partly manufactured goods increased substantially; and

those of manufactured goods increased slightly.

United Kingdom.—The cost of living in the United Kingdom continued to rise in 1955. The index in September 1955 was about 5% above that of the previous September. Retail food prices during the same period increased approximately 8%. The index of wholesale prices increased during the year and reached a level in September 1955 which was about 4% above that of the previous September. Wholesale prices of foods during the same period increased about 1%. These figures reflected a moderate inflationary situation. A substantial increase in demand for industrial equipment, which occurred in 1954, continued unabated in 1955, and was not expected to lessen appreciably until late in 1956. Also, wage increases and the end of rationing (mid-1954) contributed to a moderate increase in the demand for consumers' items in 1955.

France.—The cost of living remained practically unchanged, and in September 1955 was approximately at the level of the previous September. Retail food prices increased moderately during the first part of the same period, but declined to a level approximately that of the previous September. Wholesale prices increased slightly, but declined later to a level in September 1955 which was about 1% above that of the previous September. Although prices of many commodities in France continued to be higher than in international markets, they have remained relatively stable for three years as the result of a substantial increase in output and productivity.

CLIFFORD L. JAMES,

Professor of Economics, The Ohio State University.

COSTA RICA. A Central American republic covering an area of 19,653 square miles, Costa Rica is bordered on the north by Nicaragua, on the northeast by the Caribbean Sea, on the southeast by Panama, and on the southwest and west by the Pacific Ocean.

Population.—The estimated population as of March 31, 1955, was 942,000 (1950 census, 800,875), and the population density approximated 47 persons per square mile. Costa Rica is divided into seven provinces, of which six bear the same name as their respective capital cities. The latter, with their 1953 populations, are Alajuela (14,950), Cartago (14,239), Heredia (13,579), Limón (18,145), Puntarenas (17,472), and San José (93,229), the national capital. The seventh province is Guanacaste, whose capital is Liberia (5,422).

Most of Costa Rica's population is concentrated in the higher altitudes, particularly in the pleasant central plateau (44% of the total 1950 population), in which are located San José, Alajuela, Cartago, and Heredia. About 33.5% of the population is urban, and less than 5% is foreign born. The people are predominantly white (98% in 1950) and largely of Spanish descent. Spanish is the official language.

Government.—Costa Rica has a republican form of government based on the Constitution of 1949. This document provides for a president, two vice presidents, a unicameral legislature of 45 representatives, and a supreme court called the Sala de Casación, which is made up of 5 members. José Figueres is president, and Dr. Raúl Blanco Cervantes is first vice president. They took office on Nov. 8, 1953.

Religion and Education.—Most of the people are Roman Catholics, and Roman Catholicism is the state religion, although state and church are separate and the constitution guarantees freedom of worship.

In 1950 approximately 80% of all persons 10 years of age and older were literate. Great emphasis is placed on education, and primary school attendance is compulsory. In 1954 the public primary schools had an initial estimated enrollment of 131,589; private schools, 7,213. The University of Costa Rica in San José had an enrollment of about 1,900. Expenditures for education in 1954 amounted to more than 15% of all disbursements. The budget of the Ministry of Education was second only to that of the Ministry of Public Works.

Finance.—Effective government receipts in 1954 totaled 233,467,081 colones (U.S. \$1 = 5.60 colones at

² Beginning with 1952 the index is revised to include more than twice as large a sample of prices as formerly. They are prices charged by manufacturers or producers, or are prices prevailing on organized commodity exchanges. The monthly index is calculated from prices collected for a single day of the month, usually the Tuesday of the week containing the 15th. Since the different commodities priced are of different importance in relation to total trade, each price is multiplied by a weight determined by its sales in 1947. The average of prices for 1947 through 1949 is now the base period (100), instead of 1926.

the official rate, and 6.63 colones on the free market), the highest in the country's history. Expenditures totaled 219,226,620 colones, also a record figure. Indirect taxes produced 72.5% of the receipts; direct taxes, 16.8%; and income from government enterprises and public services, 6.3%. The internal debt at the end of 1954 was 186 million colones, a reduction of 6 million since the end of 1953, while the external debt amounted to 130.9 million colones, as compared with 135.4 million at the end of 1953. Foreign exchange reserves rose by \$8.2 million between the end of June 1954 and the end of June 1955, to \$28.8 million.

The cost of living in 1954 increased somewhat over that of 1953, from an index of 122 (1948 = 100) to 126; in July 1955 the index was 131. Prices of food were up slightly over 1%; rents, about 3%; and electric power, about 14%. The wholesale price index rose from 99 (1948 = 100) in 1953 to 104 in 1954, and to 106 by July 1955. In general, however, inflationary tendencies were held in check through government control of rents and the prices of certain commodities.

Agriculture.—Costa Rica is basically an agricultural country, with about 55% of its working population engaged in agriculture as of 1950. Although the diversification of agriculture is unequalled in Central America, coffee, with a total export value of \$35 million in 1954, is the principal export crop and source of dollar exchange. The record 1954-55 crop exceeded 740,000 quintals (1 quintal = 101.4 pounds), but that of 1955-56 was cut by drought. Bananas constitute a crop of about equal export value, and in 1954 banana exports amounted to \$32.7 million. Most of the bananas are produced by the Costa Rican Banana Company, a subsidiary of the United Fruit Company. Production in 1954 was about 10 million stems. Other important export crops are cacao (8,409 short tons shipped in 1954), abacá, and cattle (8,330 head shipped in 1954-55). Among the basic foodstuffs produced are corn, rice, beans, and sugar.

Manufacturing.—Industrial development in Costa Rica is limited and most factories are small, producing chiefly consumer goods. The country is heavily reliant on imported materials. In 1954 new can and edible oil factories were opened, and in 1955 a new pesticide plant. Margarine production in 1954 reached about 100,000 pounds monthly, and a new cacao processing plant produced about 115,200 pounds of cocoa powder and 76,800 pounds of cocoa butter during the year. The country's first National Industrial Fair was held in San José from Dec. 28, 1954, to Jan. 6, 1955.

Development is handicapped by a shortage of electric power, total installed power capacity being estimated at only 50,000 kw. in 1954. In 1955, however, two new thermal plants, with a combined capacity of 10,000 kw., were opened by the government, and a hydroelectric plant was scheduled for completion by 1957.

Foreign Trade.—Costa Rica's foreign trade in 1954 reached record levels, with imports valued at \$80.6 million, as compared with \$73.6 million in 1953, and exports at \$80.9 million (\$80.1 million in 1953). Coffee, bananas, and cacao together accounted for \$65.9 million of the total exports. The United States and western Germany were the chief coffee purchasers. Major imports included machinery, vehicles, metal products, textiles, chemicals, wheat flour, lard, petroleum products, and pharmaceuticals.

Transportation and Communications.—Despite economic and political problems, civil aviation in Costa Rica showed increases in passenger and cargo movement in 1954. International flights numbered more than 61,000, and domestic flights more than 129,000. Cargo movements reached 6,000 short tons to and from international points, and domestic cargo totaled about 20,000 tons.

UNITED PRESS

Costa Rica's deputy foreign minister, Fernando Fournier (l.) appeals to the Council of Organization of American States in Washington, Jan. 12, 1955, for aid against invasion by 'rebels' from Nicaragua. Venezuela's delegate is seated at right.

The new international airport at El Coco was opened in June 1955.

Costa Rica has about 350 miles of highways. Work on the Costa Rican section of the Inter-American Highway progressed in 1954, with operations concentrated in Guanacaste Province. The highway was advanced 25 miles, to within 10 miles of the Nicaraguan border. There are 411 miles of railways operated by the British-owned Northern Railway of Costa Rica and the government-owned Pacific Railway, both of which let contracts for additional locomotives to be delivered in 1955.

The Cía. Nacional de Fuerza y Luz installed a number of new telephones in 1954, bringing the country's total to 10,807, of which 9,406 are in San José.

Principal Events, 1955.—The outstanding event of the year was the outbreak of a rebellion in the northern part of the country, near the Nicaraguan border. On January 8, Costa Rica complained to the Organization of American States (OAS) that she was threatened by forces training in Nicaragua and planning invasion, and asked that body to investigate under the terms of the Inter-American Treaty of Reciprocal Assistance signed in Rio de Janeiro in 1947. Hostilities broke out on January 11, when rebel forces, reportedly advancing from Nicaragua, occupied a portion of the northern province of Guanacaste as well as the town of Villa Quesada, farther south. On the same day the OAS Council decided to dispatch an investigating committee, which arrived in San José on January 13. Meanwhile, rebel planes were active, one of them strafing San José. On January 16, acting under OAS authorization, the United States sold four F-51 fighter planes to Costa Rica. Actual fighting was of brief duration. The number of rebels was small, and by January 25 the last of them had fled to Nicaragua, where they were interned. (Some of them subsequently returned to Costa Rica, where there was a brief renewal of the fighting, from January 29 to February 5.)

On February 17, the OAS investigating committee, under the chairmanship of Luis Quintanilla of Mexico, made public its report, which implied that Nicaragua bore a large measure of responsibility for the revolt. It recommended that a commission be established to attempt to reconcile the two countries. Although there was a resumption of ill feeling in June and July, relations

eventually improved, and by September 8 the OAS was able to discontinue its consideration of the matter. (See also ORGANIZATION OF AMERICAN STATES.)

A three-week strike at the Laurel plantation of the United Fruit Company, for which Communist labor leaders were partly responsible, was settled amicably on October 1 after consultations among the strikers, the company, and the government, and a three-year wage contract was signed. A similar agreement for the Golfito area was signed on November 2.

of Agricultural Sciences.*

COTE, Alcide, Canadian government official: b. St. Jean (St. Johns), Quebec, May 19, 1903; d. Ottawa, Aug. 7, 1955. After receiving a law degree from the University of Montreal in 1928, Alcide Côté practiced law in St. Johns, where he was the founder and first president (1936-38) of the St. Johns and Iberville Junior Board of Trade. Mayor of St. Johns from 1945 to 1949, he was elected as a Liberal to the Canadian House of Commons from St.-Johns-Iberville-Napierville in the general election of 1945, and was re-elected in 1949. From 1952 until his death he was postmaster general in the cabinet of Prime Minister Louis St. Laurent.

COTTON. The supply of cotton in the United States for the August 1955-July 1956 marketing year was a record 25,726,000 running bales, according to the Agricultural Marketing Service. This was 2,263,000 bales more than in 1954-55 and above the previous record of 24,568,000 in 1939-40.

Farmers produced 14,476,000 running bales (14,663,000 bales of 500 pounds gross weight) in 1955, compared with 13,696,000 in 1954. Acreage allotments and marketing quotas were again in effect, and the crop was harvested from only 16,882,000 acres, 2,369,000 less than the year before. But yields set a new record for the third consecutive year, reaching an average of 416 pounds per acre, 75 pounds more than in 1955.

* Preliminary. Note—Bales are 500 pounds gross weight or about 480 net pounds of lint. (Source: Agricultural Marketing Service, U.S. Department of Agriculture.)

Cotton production has exceeded total use each year since 1951. As a result, carry-over stocks have built up rapidly, rising from the post-World War II low of 2,278,000 bales in 1951 to 11,100,000 on Aug. 1, 1955. Imports in 1955-56 were expected to total about 150,000 bales.

* Preliminary. Note—Years shown refer to crop years, beginning August 1, in which major portion of crop was harvested. (Source: Foreign Agricultural Service, U.S. Department of Agriculture.)

Cotton production in other countries in 1955-56 was estimated at 25,900,000 bales by the Foreign Agricultural Service. This was 1,200,000 bales higher than a year earlier, and marked a continuation of the upward trend in production abroad. Output in non-Communist countries abroad was estimated at 16,700,000 bales. Incomplete information indicated a total of 9,200,000 bales for areas under Communist domination.

WAYNE DEXTER,

Agricultural Marketing Service, U.S. Department of Agriculture.

COUNCIL OF EUROPE. In 1955 the Consultative Assembly of the Council of Europe met twice in the Palais de l'Europe at Strasbourg, France. Guy Mollet, French Socialist leader, was re-elected president of the 132-man body on July 5.

In the first session, held on July 5-10, the subject of membership dominated the assembly's agenda. It was recommended that the council's membership statutes, which require that member nations be parliamentary democracies (as defined by Western criteria), be revised to extend admission to all European nations. Although the membership of excluded countries such as Yugoslavia, Spain, and Portugal is desired by the council in general, the proposals, which envision the inclusion of the Soviet Union's eastern European satellites, were protested by some delegations who felt that such an extension would compromise the council's democratic ideals. Despite both British Foreign Secretary Harold Macmillan's and French Foreign Minister Antoine Pinay's endorsement of the recommendations in speeches before the assembly (July 6), no action was taken at that time.

In the second meeting, held on October 16-27, the discussions were focused on the forthcoming Geneva Conference (q.v.) of foreign ministers. Believing that the West had too eagerly sought for some agreement with the Soviet Union at the summit conference in July, and fearing lest this eagerness carry over into the negotiations of the foreign ministers at the expense of the West, the General Affairs Committee of the Consultative Assembly adopted a report which urged the West to press firmly for the reunification of Germany and to oppose vigorously the status quo in eastern Europe. (For membership and structure of the Council of Europe, see EUROPEAN ORGANIZATIONS.)

For data on crime trends in Canada, see the article CANADA; and for related material, see CHILD WELFARE; FEDERAL BUREAU OF INVESTIGATION; NARCOTICS; PRISONS.

U.S. CRIME STATISTICS

Crime figures for the United States in the first six months of 1955 indicate that, for the first time in seven years, there may be a decline in major crimes across the nation. The estimated number of major crimes committed during the first half of 1955 was 1,128,350, a decline of 7,790 from the 1,136,140 total for the same period in 1954, or a decrease of 0.7%.

Crime Trends.—Five of the eight major crime classes showed decreases during the first six months of 1955. There was a 15.1% decrease in robberies during the first six months of 1955, as compared with the same period for 1954; murders decreased 3.8%; burglaries, 3.3%; manslaughter by negligence, 0.3%; and auto theft, 0.2%.

The largest rise in crime was a 6.3% increase in rape offenses during the first six months of 1955 over the same period in 1954. Aggravated assault offenses increased 1.1% during this period, and larcenies increased 0.9%.

The 0.7% decrease in crime during the first half of 1955 occurred both in and out of cities. The total major crimes reported by city police decreased 1.4%. Sheriffs and other officers policing rural areas reported a decrease of three hundredths of 1%.

The direction of the trends coincided for urban and rural areas in five of the eight major crime classes—murders, robberies, and burglaries down; rapes and larcenies up. Negligent manslaughters and aggravated assaults were up in cities, down outside the cities. Auto thefts decreased in cities but rose in rural areas.

The decrease in total city crime, as well as in total rural crime, was led by a 15.3% and a 14.3% decrease, respectively, in robberies. Burglaries decreased 4%, and murders were down 3.4% in the cities, while rural burglaries decreased 1.7%, and murders were down 4.1%. Statistics reflect that rape offenses increased 10.4% in the urban areas and 1.5% in rural communities. In addition, larcenies were up 0.1% in the cities and 2.9% in the rural districts. Negligent manslaughter increased 5.7% in the urban areas, but decreased 7.2% in the rural communities; and aggravated assaults were up 2.9% in the cities and down 5.5% in the rural areas. Conversely, auto theft in the cities declined 0.4%, while rural auto thefts increased 0.4%.

Persons Arrested.—The following data relating to age, sex, and race of persons arrested are from special report forms sent to the Federal Bureau of Investigation by city police. The figures are for

arrests in 1,389 cities; however, the reporting area covers about 43% of the city population.

Sex.—Male arrests outnumbered female arrests 8 to 1 in 1954. Of the 1,688,555 persons arrested in 1,389 cities during 1954, 185,383, or 11%, were females. Male arrests numbered 1,503,172, or 89%, of the arrests in these cities.

Age.—Of the 1,688,555 arrests recorded by the 1,389 reporting cities during 1954, 9.7% were persons 17 years of age or less, and 16% were under 21.

Juveniles (under 18) represented 57.6% of all persons arrested for auto theft. They were also high in burglary and larceny arrests—49% and 43.6%, respectively, of the persons arrested in each category.

Over 51% of arrests for property crimes were of young persons under 21; however, young people represented only 14% of the arrests for crimes against the person.

Of the total persons arrested in 1954, 436,072, or 25.8%, were under 25 years of age. Of the remaining arrests, 212,689 involved persons who were 25 to 29 years of age. The age group 30 to 34 accounted for 210,239 of the arrests; the age group 35 to 39, for 196,724; the age group 40 to 44, for 186,122; and the age group 45 to 49, for 154,128. Persons who were aged 50 or older accounted for 291,811 arrests, and the age of persons involved in 770 arrests was not known.

On the basis of reports sent in by 253 large cities showing a combined population of 25,213,979, arrests of juveniles (under 18) rose 2.8% in 1954, while total arrests decreased 0.5%.

Race.—Over 97% of the 1,688,555 persons arrested in 1954 in 1,389 reporting cities were members of the white and Negro races. Arrests of members of the white race totaled 1,206,110, or 71.4%, of all arrests in the reporting cities, while 439,762, or 26%, were members of the Negro race. The remaining arrests, totaling 42,683, were made up of 33,212 Indians, 363 Chinese, 194 Japanese, and 8,914 others.

Offenses Cleared by Arrest.*—Police departments in 1,732 cities whose populations total 64,550,726 reported 333,631 clearances by arrest out of 1,208,844 known major offenses in 1954. These clearances resulted from the arrest and charging of 242,687 persons. Police reported 68,706 offenses against the person, and cleared 52,757 (15.8% of all clearances). They reported 1,140,138 crimes against property, and cleared 280,874 (84.2% of all clearances for the year 1954).

The difference in the rates of clearance for crimes against the person and property crimes is similar to that seen in other years. The personal crimes plus the property crime of robbery are generally considered the more vicious of the major crimes. Police possibly concentrate on these, and some clearances may be due to leads provided by the personal contact of the victim with the criminal.

Persons Found Guilty.—Of the persons charged with major crimes by police in 1954, 72.1% were found guilty. Based on reports of police in 201 cities whose populations total 24,662,474, persons charged with manslaughter by negligence were the least likely to be convicted (42.5% found guilty). Of the major offenses, the highest percentage of convictions resulted from trials of persons who were charged with robbery,

* The term "cleared by arrest" is used in those instances in which one or more of the offenders responsible for the commission of a particular offense were arrested and subsequently made available for prosecution.

with 80% of this group being found guilty.

J. EDGAR HOOVER,

Director, Federal Bureau of Investigation.

CRIME PREVENTION

With the number of juvenile delinquents brought into court rising steadily since 1949 to a new high in 1954, as reported by the U.S. Children's Bureau, and an increase of 5% in major crimes committed in 1954, as estimated by the Federal Bureau of Investigation, official and unofficial agencies intensified their crime prevention efforts throughout the United States.

The United Nations held its first World Congress on the Prevention of Crime and Treatment of Offenders, in Geneva, Switzerland, Aug. 22 to Sept. 3, 1955, attended by delegates and observers from 66 countries. Seventeen members appointed by the State Department represented the United States. One section of the congress dealt with the problem of reducing delinquency through preventive action in the community, and adopted recommendations on research pertaining to causation, prediction, and prevention. Other sections were concerned with measures to improve the penal systems of the world through better treatment of prisoners, training of personnel, improved prison industries, and extension of open and less repressive institutions. (See also PRISONS.)

This congress was followed in September by the Third International Congress on Criminology, which met in London to discuss recidivism and to propose measures to curtail repetition of criminal behavior.

The Children's Bureau of the U.S. Department of Health, Education, and Welfare created a new unit—the Division of Juvenile Delinquency Service—to aid states, territories, and local communities in improving their police, court, probation and institutional services. This unit, financed by a \$75,000 congressional grant, supplanted the bureau's three-year-old Special Juvenile Delinquency Project, which was supported by private funds and dissolved on June 30, 1955. Specialists from the new division will provide technical consultation to foster community planning for the prevention, control, and treatment of delinquency.

Congress appropriated \$154,000 to permit the Senate Subcommittee to Investigate Juvenile Delinquency to continue its public hearings in local communities throughout 1955. The subcommittee devoted special attention to the effect on youth of pornography and the depiction of crime and violence in the media of public communication. It also investigated the relationship between lack of suitable employment opportunities and youthful crime. Its chairman, Sen. Estes Kefauver of Tennessee, proposed that the federal government take an active part in crime prevention, but a bill he introduced in the Senate incorporating his proposals failed of passage.

Many official bodies, both state and local, strengthened their youth programs. The New York City Youth Board, with an appropriation of almost \$1 million, launched an "all-out attack" on delinquency by expanding its referral units for early detection, its group work with street clubs, and its recreational facilities, and planned further in-service training for its youth work personnel. The Community Research Association of New York, a nonprofit organization, undertook a \$2 million, five-year research in communitywide planning for reduction of major human problems, including delinquent and criminal behavior, to

be carried on in local areas in California, Minnesota, and Maryland, calling for a team approach that relates antisocial behavior to mental and emotional illness and family disintegration.

Comic books, of which approximately 100 million are said to be sold each month in the United States, continued to receive attention of state and municipal law-making bodies as well as numerous citizen groups. Many of the publishers, through their Comics Magazine Association of America, Inc., now conform to an established code, limiting or prohibiting depiction of crime, horror, excessive violence, and lurid sex (see also CENSORSHIP). Thirteen states enacted laws in 1955 curbing the sale to minors of books which might precipitate criminality in emotionally unhappy or unstable youths.

In at least one third of the states, the Children's Bureau reported, action at the state level took the form of legislation for improved court or probation facilities or of surveys or research studies related to crime prevention. Maryland opened a forestry camp for delinquents, such as California has had for many years. New York provided for similar camps for the 16-21-year-old offenders, and hostels for minors on probation or parole having no suitable home. Detroit police, faced with a "record high in youth crime" in 1954, reported a decrease in the first four months of 1955, following a preventive program planned jointly with church, school, business, and family groups. Training in the specialized field of police work with juveniles was stepped up in many localities. Hundreds of state and local conferences brought forth innumerable proposals. President Eisenhower sponsored a movement to get more youngsters into athletic contests; ex-President Hoover urged more boy's clubs for the nation's three million "pavement boys."

The National Probation and Parole Association, aided by a grant of over half a million dollars from the Ford Foundation, launched a five-year program to combat juvenile delinquency by strengthening courts and agencies dealing with juvenile offenders. Working at the outset in a few states, a "program of action" will be developed through the building of adequate services in courts, in probation and parole, and in correctional institutions. The association hopes that a pattern of prevention and rehabilitation will be worked out experimentally as a "citizen action program" that might be generally adopted if proved successful.

Public school systems increased their school counselor services for primary and elementary school children. On the assumption that the school is in a key position to detect the potential delinquent at an early stage, attention is being directed more and more to methods of "spotting" the future troublemaker before his problem becomes serious enough for court action. Two public schools in New York City are conducting an experiment to test out prediction techniques developed by Drs. Sheldon and Eleanor Glueck for use with the 5- and 6-year-old child. Teacher-training courses are emerging as a natural consequence of emphasis on the application of scientific techniques in meeting an old problem. The Boston public schools launched a training course for teachers to develop greater understanding of the school's responsibilities in the curbing of delinquent careers.

Although numerous panaceas were proposed for the prevention of crime, and many "causes" were pointed to, there was considerable agreement that the moral tone of a community and

its ethical and religious values are of paramount importance in efforts to achieve a significant reduction in the volume of crime that now constitutes a serious national problem. (See also *CHILD WELFARE*; *POLICE*.)

CROSS-COUNTRY. See *SPORTS*, *GAMES*, AND *SHOWS*.

CUBA. With an area of 44,208 square miles and a population (1953 census, revised in June 1954) of 5,823,187, Cuba is strategically and commercially the most important of the West Indian republics. The capital, Havana, which has a population (1953) of 783,162 (more than a million, counting the suburbs), is the governmental center for the island's six provinces. The six other largest cities, with urban area populations (1953 census) are: Holguín (226,644), Camagüey (204,254), Santa Clara (144,630), Santiago de Cuba (166,565), Sancti Spiritus (115,484), and (1943 census) Marianao (135,815). The government estimates that about 75% of the population is white, and 25% is colored and mixed.

Government.—Gen. Fulgencio Batista was inaugurated constitutional president on Feb. 24, 1955, after winning a *candidato único* (single candidate) election on Nov. 1, 1954. His inauguration automatically reinstated the Constitution of 1940, which provides for a unitary state organized along semiparliamentary lines. President Batista had been governing under a constitutional code of 275 articles since he seized power by force on March 10, 1952. The president receives a salary of \$60,000 a year.

Education and Religion.—Education is compulsory and free between the ages of 7 and 14. About 22% of the population above 15 years of age is illiterate, which gives Cuba one of the best records for literacy among the Latin American republics. In 1950 the teaching staff of public primary schools totaled 20,666 (546,984 students); secondary schools, 1,151; technical schools, 1,584; and teacher-training schools, 492. The University of Havana usually has about 17,000 students and 600 professors; there are three other universities. The budget of the Education Ministry for 1955–56 was 71,351,285 pesos, by far the largest amount placed at the disposal of any ministry. In 1954 Cuba had 685 priests in 203 parishes. The Roman Catholic Church also had 49,148 students in 187 schools.

Finance.—The ordinary and extraordinary budgets for 1955–56 totaled 312,874,826 pesos (the peso equals \$1 in U.S. currency). Although there was a deficit for 1954–55, it appears that budgetary operations for the 1956 fiscal year will be on a nearly balanced basis. The National Bank's statement of Aug. 31, 1955, showed official international reserves of \$519,900,000. Total deposits in commercial banks as of Aug. 22, 1955, were \$761,700,000.

Agriculture.—Cuba is the world's leading producer of sugar, with about 3.9 million acres devoted to sugarcane. The 1955 crop was controlled at 4,400,000 Spanish long tons (1 long ton equals 2,271 pounds), about 7% less than the 1954 crop. As of Aug. 15, 1955, Cuba had exported 2,991,588 long tons of sugar, of which approximately 1,482,000 tons had been shipped to the United States, where about 33% of the sugar market is supplied by Cuba. By the middle of 1955, the Soviet Union had purchased 500,000 tons of sugar. Production of high-test molasses from 1955 surplus sugarcane was 231,482,809 gallons. Leaf tobacco, cigars, cigarettes, and scrap tobacco accounted for about 5% of total exports. There was a reduction of about 10% in the 1955 tobacco crop. Cuba's coffee crop in 1954–55 amounted to 643,000 bags (132 pounds each). The estimated rice crop for 1954–55 was

340 million pounds; however, Cuba produces only about 40% of domestic rice requirements.

Industry.—In 1954 the government inaugurated a 350 million-peso economic and development plan, financed largely by a public bond issue. Allocations against the 100 million pesos authorized for the fiscal year 1955–56 totaled more than 41 million by the end of July. The major items were: 20 million pesos for construction and equipping of public schools; 8 million for port improvement; 6 million for construction and repair of tax, post, and telegraph offices; and 3 million for public hospitals. Business was slightly better in 1955 than in 1954. As of August 1955, cotton textile mills were operating at about 70% of capacity, rayon weaving mills at more than 80% (10–15% above the August 1954 rate), and rayon tire cord yarn, tire fabric, and rayon staple mills at full capacity.

Monthly mineral production in 1954 was: manganese, about 15,000 tons; nickel, 2,427,000 pounds; copper, about 3,100,000 pounds; refractory chrome ore, nearly 6,000 tons; and iron pyrites, 10,000 tons. Although production of nickel in 1955 was about the same as in 1954, the expansion of plant facilities at Nicaro is expected to increase the productive capacity by 75%. The production of copper concentrate up to August was 12% above that of 1954 for the same period, and manganese production was 20% above that of 1954 for the period up to August. Oil companies have committed \$15 million to \$20 million for research and exploration, not including a \$10 million exploration contract signed with the government in September 1955. However, domestic production of 1,200 barrels of oil per day is only about 2% of Cuba's daily petroleum requirements.

Hotels reported a 20–25% increase in the number of tourists in the summer months of 1955. About 234,200 tourists visited Cuba in 1954 and spent about \$50,849,000. The construction of the Havana Hilton Hotel, a 27-story, \$14 million project, was begun in June 1955.

Foreign Trade.—Cuba had an unfavorable balance of trade in 1954 of about \$82 million. Cuban exports to the United States in 1954 were valued at \$401,300,000, and imported goods were valued at \$428,200,000. Imports from the United States for the first half of 1955 were valued at \$226,400,000, and exports to the United States at \$220,900,000.

Transportation and Communications.—Cuba has 2,040 miles of major highways and 2,989 miles of railways. Private automobiles in 1954 numbered 106,159; telephones numbered 141,053, of which 104,290 were in Havana.

The official Bank of Economic and Social Development granted concessions in July to develop two major self-liquidating projects, to be financed by a bond issue: (1) a 30 million-peso maritime terminal on the state-owned, largely unused Cayo Cruz Peninsula in Havana harbor; and (2) a 22 million-peso 70-kilometer toll highway to link Matanzas with the Via Blanca leading into Havana. This road will open the coastal area for tourism.

Principal Events, 1955.—Although the administration of President Batista has achieved many successes in economic, social, and political areas since 1952, the increased number of bombings, assassinations, and political strikes in 1955 indicated growing political tensions. The political amnesty law of 1954 brought back to Cuba many enemies of the regime and encouraged the formation of anti-Batista parties. Former President

Carlos Príos Socarrás, who returned to the capital from exile on Aug. 11, 1955, stated that he intended to bring political opposition groups together and to persuade public opinion to force the government to restore complete political freedom.

On April 7, 1955, Dr. Jorge Mañach, journalist and well-known intellectual, announced the formation of a new political party called Movimiento de la Nación, the purpose of which is to oppose the government.

The killing of Jorge Agostini on June 9, 1955, made headlines in Cuban newspapers for days. Agostini, former naval commander and head of the secret police of the presidential palace under Presidents Grau San Martín and Príos Socarrás, had recently returned from asylum in Mexico.

In January, the Popular Socialist Party (Communist) was declared illegal. *La Calle*, a violently anti-Batista newspaper, was closed on June 17.

WILLIAM S. STOKES,
Professor of Political Science,
University of Wisconsin.

CULBERTSON, Ely, American bridge expert, lecturer, and author: b. Poyana de Vervilao, Rumania, July 22, 1891; d. Brattleboro, Vt., Dec. 27, 1955. One of the leading authorities on contract bridge, he devoted much of his time in later years to world peace.

The son of an American oil engineer, Culbertson was brought up in the Caucasus, where he was imprisoned for revolutionary activities. Subsequently he studied in Geneva and Paris, and in 1921 settled in the United States, where he became an expert bridge player. With his wife, the former Mrs. Josephine Murphy Dillon, to whom he was married in 1923 (they were divorced in 1938), he built up a highly successful career as an authority on contract bridge bidding. In 1929 he founded the *Bridge World*, which he continued to edit until his death. He won the Vanderbilt Cup in 1930, and his fame was assured after he defeated Sidney S. Lenz in a six-week match in 1931. With lecture and teaching fees, royalties from books and columns, and film and radio commitments, he soon became wealthy.

In 1940 he devised a plan for world peace through federation, arms limitation, and the establishment of an international police force. Elaborated in several books, his ideas were furthered by World Federation, Inc., founded in 1942, and, after the establishment of the United Nations, by the Citizens Committee for United Nations Reform, of which he was chairman. His second marriage, to Dorothy R. Baehne in 1947, ended in divorce in 1954.

In addition to his autobiography, *The Strange Lives of One Man* (1940), Culbertson's published works include *Contract Bridge Blue Book* (1930); *Contract Bridge Complete* (1936); *The World Federation Plan* (1942); and *Total Peace* (1943).

CUSTOMS, Bureau of. Reflecting the upward surge of the United States economy, and expanding personal income figures, foreign trade and travel were at a high level during the fiscal year ended June 30, 1955. Customs activities increased accordingly, with the year constituting the busiest period in the history of the service.

Trend of Business.—Customs transactions involving total entries of merchandise into the United States set a new record of 5,247,000,

compared with 4,900,000 in the previous year, as the value of imports again exceeded \$10 billion. The increase in entries of merchandise subject to duties was particularly notable.

The volume of foreign travel again was at a peak level, with some 120,826,000 persons entering the United States, and passing through customs, during the year. While the total reflects increased to-and-fro border traffic, most types of substantial travel also showed marked increases. Air travel continued to make spectacular gains, with arrivals from abroad, including military planes, at a new high of 117,500, bringing in some 2,000,000 passengers, also a record. The respective figures for the previous year were 99,900 and 1,693,000. While vessel traffic held about the same as in 1954, passengers arriving by ship increased from 921,000 in 1954 to 975,000. Vehicles arriving totaled 30,957,000, compared with 29,536,000 in fiscal 1954, and brought in 89,713,000 passengers, compared with 85,493,000 in 1954.

Collections.—Total revenue collected by the Bureau of Customs (including collections for other agencies, such as internal-revenue taxes on imported liquors) was a record \$858,776,181, up sharply from the \$801,280,712 of the previous year. Included were customs duties and miscellaneous collections of \$611,239,572, somewhat below the record of \$629,967,772 established in 1951, but larger than the \$566,610,320 in fiscal 1954.

Administrative Developments.—The Bureau of Customs continued to press aggressively a program of simplification of procedures, both for the benefit of foreign traders, and to accomplish more economical and more efficient administration of the tariff and related laws. Numerous administrative changes were effected toward this objective. One was the elimination of the long-standing requirement for consular certification of invoices submitted by foreign shippers, which applied to a substantial portion of merchandise exported to the United States.

A major accomplishment was the achievement of a nationwide near-current basis in "liquidations," the audit process of making final determination of duties on merchandise importations. The large backlog of entries waiting such determination has been virtually wiped out by new procedures made possible by the Customs Simplification Act of 1953. This is a development of importance to importers who frequently had experienced delays in learning the exact amount due on goods moving into commerce on the basis of estimated duties.

A further simplification measure, revising methods prescribed for determining value of merchandise imports for customs purposes, was passed by the House of Representatives in 1955 but was not acted upon by the Senate.

Enforcement.—During the 1955 fiscal year, the Bureau of Customs was confronted with five major enforcement problems: the smuggling into the country of (1) narcotic drugs, (2) diamonds, (3) watch movements, and (4) psittacine birds; and (5) the smuggling out of the country of arms, ammunition, and implements of war.

Total seizures of contraband drugs, including marihuana, were 24,811 ounces in fiscal 1955, compared with 26,758 ounces in 1954. Seizures of marihuana continued comparatively high, while opium-type drugs apprehended were somewhat smaller in volume.

There were 728 arrests made during the year for violations of customs laws, and more than 500

offenders were convicted in cases reaching trial.

RALPH KELLY,
Commissioner of Customs.

CYCLING. See SPORTS, GAMES, AND SHOWS.

CYPRUS. Since 1925 a British crown colony, this third largest Mediterranean island lies 60 miles west of Syria and 40 miles south of the coast of Turkey. It has an area of 3,572 square miles and a population estimated in 1954 at 517,000, of which 80% was of Greek origin and nearly 18% Turkish. The capital and largest town is Nicosia (pop., 53,300, including suburbs), and principal ports are Limassol (27,000), Famagusta (20,500), and Larnaca (16,500).

Government.—Authority in Cyprus is exercised by a governor (Sir Robert Perceval Armitage, until Sept. 25, 1955, when he was succeeded by Sir John Harding), assisted by a 7-member Executive Council. Appointed commissions manage the affairs of 627 villages.

Finance.—Estimated revenue in 1955 was £9,658,165; expenditure, £9,562,023. Over £5 million had been spent between 1946 and the end of 1954 on the 10-year development plan for Cyprus.

Education.—In 1954 there were 730 elementary schools (71,877 pupils) and 57 secondary schools (18,353). Each religious community has separate elementary schools (56,860 Greek and 13,171 Moslem pupils). Postsecondary education is offered in two government centers at Morphou and Nicosia.

Defense.—British defenses on Cyprus, including an extensive command post on the Episkopi Peninsula and an island garrison of 4,000, are being developed at a cost of \$84 million. A United States airbase was established near Nicosia in 1952.

Economy.—A diversified agricultural economy employed 134,300 persons, or about 55% of all wage earners in 1954; about 47,000 were employed in manufacturing.

The value of overseas trade rose by nearly £4 million to over £40 million in 1954. Exports, 36% of which were farm products, included copper concentrates (93,610 tons valued at £3,686,369), iron pyrites (678,954 tons, £3,338,223), and asbestos (18,163 tons, £868,668). Total imports were valued at £23,571,000; exports, £16,973,000. Income from tourism was estimated at £1,750,000 in 1954.

Transportation and Communications.—Nine airlines maintain regular services to Cyprus, and in 1954, 94,500 persons passed through the airport at Nicosia. Cyprus' 760 miles of asphalted roads are linked with 1,800 miles of subsidiary roads. In January 1955 there were 18,368 motor vehicles and some 55,000 bicycles.

Principal Events, 1955.—In 1955 the demand grew in Cyprus for self-determination for the island as the preliminary to union with Greece. Activities of the National Organization of Cypri-

THE CYPRUS PROBLEM

In September, while the London conference on Cyprus (Aug. 29-Sept. 7) was in progress (see accompanying text), demonstrations and violence occurred in Cyprus (1), and at Izmir (2), Istanbul (3), and Salonika (4).

THE NEW YORK TIMES

UNITED PRESS

Grim-faced Cypriotes, demanding home rule for Cyprus, watch British troops guarding the city of Nicosia.

ote fighters, the underground terrorist movement commonly known as EOKA, were accompanied by a wave of bomb explosions beginning in April, continuing several months, and reaching a peak of anti-British violence in November and December. Fifty explosions, spread over the entire island, occurred on November 19, and on November 26 an unsuccessful attempt (by bombing) was made on the life of the governor. In November, British casualties included 7 soldiers killed.

The British government called a London conference, held August 29-September 7, which the Greek, Turkish, and British foreign ministers attended. The Greek delegation came ready to arrange for British-leased bases on the island, in return for the granting of self-determination to Cyprus. British Foreign Secretary Harold Macmillan offered greater autonomy for Cyprus, reportedly including an elected assembly, but denied Cyprus the right to join Greece. Greek Foreign Minister Stephan Stephanopoulos was severely disappointed in the results of the meeting and also apparently shocked by the intransigence of Turkey, whose leaders declared their government's intention to claim Cyprus rather than have it turned over to Greece.

Before the conference terminated there were outbreaks of rioting in both Greece and Turkey on September 6. Anti-Greek riots took place in Istanbul and Izmir, and an explosion occurred at the Turkish consulate general in Salonika. Both the Turkish and Greek governments subsequently exchanged formal apologies. (See also GREECE; TURKEY.)

Meanwhile, military precautions were taken by Great Britain on Cyprus. Equipment was transferred from Malta, and 1,500 Royal Marine commandos, augmented in October by 800 British veterans of the Korean War, were assigned to Cyprus. By December, emergency forces on Cyprus had grown to 14,000. On September 15, the EOKA was declared outlawed; and on December 14, all forms of Communist organization also were outlawed and 130 Red leaders arrested, including the Communist mayors of Larnaca and Limassol.

On September 25, Field Marshal Sir John Harding was named governor and commander in chief of British forces on Cyprus. He held talks on October 11-12 with Archbishop and Ethnarch Makarios III of Nicosia, leader of the Enosis (union with Greece) movement. These consultations came to nothing. The possibility of mediation by the United Nations faded when the Cyprus question was excluded on September 20 from the General Assembly agenda, but on De-

cember 5 a change in British policy was indicated in London, where the foreign secretary stated that self-determination for Cyprus could be considered "some time and in certain conditions."

DONOVAN ROWSE,
Author and Publicist.

CZECHOSLOVAKIA. A Soviet-dominated and Communist-controlled people's republic of central Europe, Czechoslovakia is bounded on the north and northeast by Poland, on the east by the USSR, on the south by Hungary and Austria, and on the west and northwest by Germany. It has an area of 49,354 square miles, and its population is officially estimated (Dec. 31, 1954) at 13,020,000. The chief cities, with their 1947 census populations, are Prague (Praha), the capital, 922,284; Brno, 273,127; Moravská Ostrava, 180,960; Bratislava, capital of Slovakia (1948), 184,423; Pilsen (Plzeň), 117,814; and Olomouc, 58,617. Of the total population, 67% are Czechs, 25% Slovaks, 3.5% Germans, and 3.5% Magyars. There are small Polish and Jewish minorities.

Government.—The Communists, who seized control of the government in 1948, have transformed the country into a Soviet-type state. The Communist Party operates through the National Front, which, in addition to Communists, includes small groups from the traditional democratic parties. These groups endorse Communist rule.

According to the constitution of 1948, the governmental organs consist of the unicameral National Assembly, whose 368 deputies are elected for 6-year terms; the Presidium of the National Assembly, the highest legislative body when the assembly is not in session; and the cabinet. The present National Assembly was elected on Nov. 28, 1954. The assembly elects the president of the republic for a term of 7 years; Antonín Zápotocký, former premier, has been president since March 21, 1953. Viliam Široký is premier. Slovakia, which is guaranteed an autonomous status, has its own 100-member National Council.

The Communist Party of Czechoslovakia is headed by Antonín Novotný, first secretary of its Central Committee, and Karol Bacilek is first secretary of the Slovak Communist Party, a subsidiary of the Czechoslovak party. In August 1955, the authorities admitted that during the year several thousand members had been expelled from the Communist Party because of "nonfulfillment of party obligations."

Education.—The entire Czechoslovak educational system has been secularized and subordinated to government control. A law of April 24, 1953, established a unified school system and made 8 years of schooling obligatory. In 1953-54 there were 9,125 elementary schools with 505,000 pupils, 2,715 junior secondary schools with 1,095,000 pupils, 304 secondary schools with 234,000 students, and 655 vocational schools with 124,000 students. The principal universities in Czechoslovakia are Charles University of Prague and the universities of Brno and Bratislava; these and 36 other institutions of higher education had a combined enrollment of 49,000 in 1954-55.

Religion.—According to a 1947 estimate, the population was distributed as follows: Roman Catholics, 9,300,000; members of the Czechoslovak Church, 950,000; Protestants, 900,000; persons claiming no religious affiliation, 820,000; Jews, 50,000; and Eastern Orthodox, 50,000. A law of Oct. 14, 1949, made the clergy civil servants of the government, and they were obliged to sign an oath of allegiance to the state. A Ministry of Church Affairs was established to handle religious matters. Persecution of churchmen continued in 1955, and the Communist Party conducted widespread antireligious propaganda.

Finance.—The Czechoslovak monetary unit is the koruna (crown), valued in exchange at 1.80 koruny to 1 ruble, or 7.20 koruny to U.S. \$1. The 1955 budget provided for total expenditures of 86,039,452,000 koruny, of which about 44 billion was allotted to the economy, 28 billion to social and cultural measures, 10.5 billion to defense, and 3.5 billion to administration. On March 30, 1955, the government announced price reductions ranging up to 28% on about 1,600 items.

Agriculture.—On June 30, 1955, at the conclusion of a two-day session, the Central Committee of the Communist Party issued a declaration calling for greater food production. It announced a policy of emphasizing the joint cultivation of land on a village basis as a propaganda move to

impress noncollectivized farmers with the alleged advantages of collective farming.

Czechoslovak collective farms are of four distinct types: (1) joint cultivation of land, but retention of ownership in land, livestock, and harvested crops; (2) joint cultivation of land with retention of ownership in land and equipment, but contribution to the collective farm of received rent; (3) joint cultivation of land, but purchase of equipment by the cooperative; and (4) common ownership of land and equipment and distribution of income according to work units. The first type is little more than a convenient partnership, but the fourth is identical with the Soviet kolkhoz. Of the total number of Czechoslovak collective farms, 95.5% were of the fourth type in 1955. In 1954, 41.5% of all grain delivered to the government, 56.4% of the sugar beets, 59% of the pork, 48.5% of the beef, and 43.3% of the milk came from collective farms of the third and fourth types and from state farms.

Production figures for 1953 (in thousands of metric tons) for some of the leading crops are as follows: wheat and rye, 2,800; barley, oats, and corn, 2,200; potatoes, 8,500; and sugar beets, 5,500. At the beginning of 1955, Czechoslovakia had a total of 32,700 tractors.

In March 1955, a government spokesman admitted that food production was below the pre-World War II level. The 1955 budget allotted 7,952 million koruny for capital investments in agriculture. According to the annual plan, approved by the Central Committee of the Communist Party at its June meeting, 300,000 acres of new land were to be brought under cultivation during the year.

Industry and Mining.—In 1953 the First Five-Year Plan (1948-53) was completed, and in 1954 the government decided not to begin the Second Five-Year Plan until 1956, so as to synchronize national planning with that of the Soviet Union and Hungary. Instead, annual plans have been made. Beginning in September 1953, national planning was consumer oriented, and proportionally higher financial allotments were made for capital investment in agriculture. On Feb. 13, 1955, however, Premier Široký announced that in the future the national economy would be based on heavy industry.

According to an official announcement, the 1954 annual plan was fulfilled 102.5%. In that year, 37,840,000 metric tons of lignite, 21,561,000 metric tons of bituminous coal, 4,430,000 metric tons of crude steel, and 13.5 billion kw.-hr. of electricity were produced. Estimates for 1953 include 2,300,000 metric tons of iron ore, 2,800,000 tons of pig iron, 2,900,000 tons of rolled steel products, 2,300,000 tons of cement, and 196,000 tons of crude petroleum.

Industrial production for 1955 was expected to rise 9% over that for 1954. On Dec. 31, 1954, Premier Široký, in a speech made at the opening of the new National Assembly, said that 1955 production targets must be achieved by curbing absenteeism and labor turnover and by improving the organization of work. The budget allocated 14,112 million koruny for capital investment in industry in 1955. In August the government announced its plan to build during the next 15 to 20 years nuclear power stations with capacities of 50,000 to 100,000 kw.

Foreign Trade.—Overall statistics on Czechoslovak trade are not available. United States exports to Czechoslovakia amounted to \$1,006,000, and imports from Czechoslovakia to \$3,074,000,

in 1954; corresponding figures for the first six months of 1955 were \$1,884,000 and \$1,693,000, respectively.

While traditionally Czechoslovak exports have consisted primarily of consumer goods (led by textiles), basic exports now consist of heavy tools and shaping equipment (boring and milling machines, high-speed lathes, forging presses, cranes, suction dredges) and transportation equipment. The bulk of Czechoslovakia's trade is with the USSR and other countries of the Soviet bloc. The 1955 trade agreement with the Soviet Union stipulated that the latter supply Czechoslovakia with grain, cotton, wool, nonferrous metals, iron and manganese ore, chemical fertilizers, agricultural machinery, and various types of industrial equipment in exchange for diesel electric passenger vessels, river tugs, suction dredges, mobile steam power plants, diesel engines, machine tools, oil piping, sugar, and rolling, forging, and pressing equipment. During the year, Czechoslovakia supplied the USSR with two sugar plants.

The Czechoslovak government has endeavored to expand trade by cutting prices, offering long-term credits, and providing free training to foreigners who purchase equipment. In 1955 special efforts were made to increase trade with southeastern Asia (Burma, India, Indonesia), Africa (Egypt, the Sudan), and South America (Chile, Argentina). In addition, Czechoslovakia is supplying Communist China with machinery and other heavy equipment.

Transportation and Communications.—Czechoslovakia had, in 1950, 8,227 miles of railway and, in 1946, 43,967 miles of roads. In 1950 the country had about 224,000 passenger cars and trucks. The Danube, Elbe, and Vltava rivers are navigable for a total of 281 miles. In 1951 the country had 350,708 telephones and, in 1952, 2,608,000 radio receiving sets. Television programs averaged about six hours daily in 1955.

Principal Events, 1955. Foreign Affairs.—During 1955 the Czechoslovak government continued to conduct its foreign policy in conformity with the international orientation of the USSR. Nevertheless, although it emphasized the new Soviet policy of coexistence and international peace, it did not make any really serious effort to improve its relations with the West. On Feb. 3, 1955, the government announced that the state of war between Czechoslovakia and Germany had come to an end, and on August 30 the National Assembly approved Czechoslovak accession to the Austrian State Treaty. On August 10, Premier Široký stated that Czechoslovakia was ready to negotiate with West Germany for the establishment of normal diplomatic relations; and on November 12 the government announced that it had released 1,437 German and Austrian prisoners, and that the remaining prisoners would be freed gradually. Otherwise, relations with the West were marred by a number of incidents.

On January 14, Switzerland protested to the Czechoslovak government about espionage carried out through the Czechoslovak legation at Bern, and the Czechoslovak military attaché was recalled. A similar protest on March 15 by Sweden resulted in an order for three Czechoslovak diplomats to leave Stockholm. On March 29, the United States government filed with the International Court of Justice a claim against Czechoslovakia for \$271,384.16 as damages for the shooting down of a U.S. Air Force plane over Germany on March 10, 1953. Then, on April 19, Czechoslovakia protested to the United States

embassy in Prague concerning alleged hostile acts perpetrated by the United States government and its agencies. The protest was aimed particularly at the organization of a Czechoslovak military unit in Germany under the alleged sponsorship of the United States government.

The announcement by Egypt on September 27 that she had negotiated an agreement to obtain arms from Czechoslovakia in exchange for cotton caused great concern in the West. It was feared that these arms might upset the balance of power in the Middle East, and so precipitate a major Arab-Israeli conflict. On October 4, Israel informed the Czechoslovak government that she considered the arms agreement an "unfriendly act."

Meanwhile, Czechoslovakia's relations with the USSR and the satellite countries were harmonious. Czechoslovakia participated in the Soviet-sponsored Warsaw Conference of May 11-14, 1955, at which 8 Soviet bloc countries concluded a 20-year treaty of friendship, cooperation, and mutual assistance. The Czechoslovak National Assembly ratified the treaty on May 24. Czechoslovakia was also designated a beneficiary of the Soviet decision to build atomic reactors in satellite countries and to provide these countries with complete equipment, fissionable material, and expert assistance. On August 24, following the Soviet example, Czechoslovakia announced that it would reduce its armed forces (estimated at 200,000 to 230,000 men) by 34,000 by Dec. 28, 1955.

On June 4 and 5, a group of Czechoslovak, Rumanian, and Hungarian leaders met with Soviet leaders in Bucharest and gave full endorsement to the Soviet-Yugoslav declaration of agreement. On July 27, however, Marshal Tito criticized the Czechoslovak government for obstructing rapprochement between Yugoslavia and the USSR. On August 12, the Czechoslovak National Assembly approved a resolution favoring better relations with Yugoslavia.

Internal Conditions.—During 1955 the Czechoslovak political scene was dominated by numerous trials of individuals or groups accused of sabotage or espionage. On February 1, 17 persons were sentenced for alleged destruction of socialist property and sabotage, and on March 10 it was reported from Carlsbad that 10 leaders of a "Social Democratic underground" had received sentences of 4 to 17 years in prison. Then, on May 31, the Ministry of the Interior announced the arrest of 13 persons accused of infiltrating Czechoslovakia from Germany as spies for the United States; many other persons were implicated. On May 9, however, an amnesty was issued for various categories of prisoners, as well as for those who had left the country illegally.

It was announced on October 14 that Premier Široký had reorganized his cabinet, increasing the number of ministers from 37 to 42. Michael Bakula replaced Oldrich Beran as minister of state control, and the latter became head of a new Office for Reconstruction. Josef Tesla was appointed minister of manpower, succeeding Vaclav Nosek, whose death had been reported on July 22. The former Ministry of Engineering was split into ministries of Heavy Industry, Precision Industry, and Agricultural Machines. Some observers are of the opinion that this division is connected with the government's efforts to find new markets for its industrial products.

DAIRY PRODUCTS. United States milk production in 1955 was estimated at 124.5 billion pounds, a new record and about 1% more than the previous high of 123.5 billion pounds in 1954. Annual milk production per cow rose to 5,630 pounds, compared with 5,512 pounds in 1954 and 4,787 in 1945. The number of milk cows at midyear was estimated to be 22,067,000, compared with 22,425,000 in 1954 and 25,110,000 in 1945. The general trend in milk cow numbers for the past 10 years has been downward, the only exceptions being in the years 1953 and 1954.

Government-owned stocks of dairy products, which reached record proportions in 1954, were sharply reduced in 1955. Major efforts on the part of government to dispose of its stocks through sales, donations, and special programs were the dominant factors. As of Nov. 1, 1955, government stocks were: butter, 108 million pounds, compared with 466 million in 1954; cheese, 278 million pounds, as against 436 million in 1954; and dry milk, 22 million pounds, compared with 599 million in 1954.

Per capita consumption of several important dairy products increased during 1955, in some instances reversing the long-time trend.

U.S. PER CAPITA CONSUMPTION OF CERTAIN DAIRY PRODUCTS AND MARGARINE (In pounds)

	1935-39	1945	1950	1955*
Fluid milk and cream.....	330	399	349	353

Evaporated milk.....	14.9	16.1	17.9	14.5
Margarine.....	2.8	4.0	6.0	8.3

* Preliminary.

According to October 1955 estimates, milk production in the principal dairy countries of the world decreased slightly in 1955, after having increased in both 1953 and 1954. Adverse weather conditions in most of Europe held production down. Greece was one of the few European countries in which output apparently increased. In France, Austria, and Norway, production in 1955 was about the same as a year earlier. Ireland had the most drastic decline.

MILK PRODUCTION IN PRINCIPAL COUNTRIES (Cow's milk, in million pounds)

Administrative Officer, Office of the Secretary,
U.S. Department of Agriculture.

THE NEW YORK TIMES

Four federally built dams in the Northwest are dedicated in one week in June 1955: (1) Lucky Peak; (2) Albeni Falls; (3) Lookout Point; and (4) Dexter. Chief Joseph Dam (A) generated its first hydroelectric power in 1955.

DAMS. Construction of large dams in the United States staged a strong comeback in 1955, with contract awards running to near 70% ahead of the previous year. There had been a period of economy in government, as well as a period of adjustment to the present administration's policy of approving partnership arrangements wherein local interests assume a share in financing major river development projects.

St. Lawrence Power Project.—This long-awaited \$660 million development of the International Rapids between New York State and Ontario was off to a good start in 1955. The first full year of construction on the international project to develop nearly 2,500,000 horsepower saw a 4,000-man construction force at work on both sides of the river. United States constructors excavated for first-stage construction on the 114-foot high Long Sault Dam. This 1,790-foot spillway dam across the river's channel on the south side of Barnhart Island will be the control structure on the power reservoir to be formed. Twenty-five miles upstream, American builders similarly have complete responsibility for construction of Iroquois Dam, a low spillway structure 1,600 feet long, which is intended to control water levels upstream in Lake Ontario while also helping to regulate the level of the power pool below.

On the channel of the river north of Barnhart

Gavins Point Dam (lower right), closed on July 31, 1955, is the fourth of six Missouri River dams to be closed as part of the Pick-Sloan river-control plan.

THE NEW YORK TIMES

Island, straddling the international boundary, is Barnhart Island Power Plant. This 3,200-foot-long dam and powerhouse will have sixteen 71,000-hp. turbines on either side of the international line. It is being built in the completely dried bed of the river's north channel behind an exceptionally long cellular steel cofferdam. Financing of this vast hydroelectric undertaking is dependent on power production (and sales) by 1958. It is therefore one of the heaviest concentrations of dam construction ever undertaken—concentrated in time as well as in space. The owner on the United States side is the New York State Power Authority; in Canada it is the Hydro-Electric Power Commission of Ontario. (See also CANALS.)

Missouri River Dams.—On July 31, 1955, closure was accomplished on the Missouri River in South Dakota at Gavins Point Dam, smallest and farthest downstream of the four main-river dams in the plan for complete Missouri Basin water use and control. Gavins Point is considered a re-regulating dam for the river below the larger Fort Randall Dam which is 75 miles upstream; it will provide 100,000 kw. of power. Fort Randall Dam neared completion in 1955 with the last of its eight 40,000-kw. units to go on the line in 1956. Oahe Dam, near Pierre, S. Dak., least advanced of the four big multipurpose units, was about 15% completed at the end of 1955. In North Dakota, Garrison Dam's 210-foot-high rolled-earth embankment was finished, and work began on installation of its five 80,000-kw. power units.

Apart from these big multipurpose main-river dams, being built by the U.S. Corps of Engineers, the work of the U.S. Bureau of Reclamation progressed through 1955 on a number of Missouri Basin rivers. Among these were Kirwin Dam in Kansas, the Frenchman-Cambridge project in Nebraska, and Glendo Unit in Wyoming. (See also RECLAMATION.)

Columbia River Basin.—In one week in June 1955, four major dams were dedicated in the Northwest. These were Lucky Peak, Albeni Falls, Lookout Point and Dexter dams (see accompanying map). These four Corps of Engineers projects represent an investment of \$140 million and a power increment of 177,600 kw., in addition to flood control and irrigation benefits. Lucky Peak is on the Boise River in Idaho; Albeni Falls is on the Pend Oreille River in northern Idaho; and Lookout Point is on the middle fork of Oregon's Willamette River, with Dexter a re-regulating dam immediately downstream.

Elsewhere in the basin, downstream on the Columbia River from Grand Coulee Dam in Washington, the major Chief Joseph Dam generated its first hydroelectric power in 1955 as a \$169 million project planned to provide 1,024,000 kw. when finally completed in 1958.

Also downstream on the Columbia, where it forms the Washington-Oregon border, The Dalles Dam moved along as a \$310 million project scheduled to produce initial power in November 1957. A rock-fill dam, to become a permanent part of the project, must be placed in water flowing at the rate of 200,000 cubic feet per second until this fast flow is closed off and diverted through a completed portion of the concrete dam and powerhouse. McNary Dam, upstream from The Dalles, continued to have power units added, toward final installation in 1956 of a total of 980,000 kw.

John Day Dam, planned for the Columbia River between The Dalles and McNary dams,

CORPS OF ENGINEERS, U.S. ARMY

Fort Randall Dam in South Dakota, part of Missouri River flood control system, as it neared completion in 1955.

emerged in 1955 as a prime example of the administration's partnership idea for river development projects. Private electric utilities in the Northwest proposed to advance the cost of constructing power elements of the \$310 million project. Under the proposal the federal government would build, own, and operate the dam.

Other evidence of how the Republican administration's partnership plan was working were to be found high in the Columbia Basin on the Snake River in Idaho, where great controversy developed over who should develop the hydroelectric potential of Hell's Canyon. Public power advocates fought for a government-planned, single, high Hell's Canyon Dam. Private interests offered a plan to build three lower dams along the Snake. In August 1955, the Federal Power Commission voted unanimously to license the Idaho Power Company to build its \$175.6 million three-dam project along a 37-mile stretch of the river. By November, the FPC had approved plans for Brownlee Dam and Oxbow Dam, the two upstream structures; design of the third, Hell's Canyon Dam, had not been completed. The 395-foot-high Brownlee Dam was due to be started in 1956. Oxbow Dam, a 205-foot-high structure was expected to be started in 1959, and the 320-foot Hell's Canyon Dam was scheduled to follow two years later. Power installation was anticipated to total 1,175,100 kw. at the three projects. This river development is designed primarily for power. Public power advocates were expected to continue their fight against present plans.

In the Columbia Basin, the Washington Water Power Company started work in 1955 on a \$79.5 million Noxon Rapids Dam across Clark Fork River in northwest Montana. It will be a 190-foot-high concrete structure expected to develop 400,000 kw.

California Dams.—Folsom Dam, a \$65 million project of the Corps of Engineers on the American River, was nearing completion in 1955. This multipurpose dam near Sacramento is a 340-foot-high concrete structure 1,400 feet long.

The \$1.6 billion Feather River project—a state plan to bring 1.8 million acre-feet of water each year from northern to southern California—remained in planning stages through 1955. The scheme involves what would be the world's largest dam—the 730-foot-high Oroville Dam on Feather River above Sacramento. Also involved in the grandiose plan is a 310-foot-high earth dam, called San Luis Dam, southeast of San Francisco.

Southeastern States.—Jim Woodruff Dam on

the Apalachicola River at the Florida-Georgia state line was virtually completed in 1955 as a \$46 million project. And in Georgia, near Atlanta, Buford Dam on the Chattahoochee was a \$41 million earthfill dam being pushed toward completion. Roanoke Rapids Dam in North Carolina was virtually completed for \$34 million on the Roanoke River by the Virginia Electric and Power Company.

Canadian Dams.—Two relatively small rockfill dams in the Quebec wilderness on a northern tributary of the St. Lawrence River were probably the most significant dams completed in Canada in 1955. Unspectacular as they may be as dams, they are to soon divert water of the Bersimis River through a 7½-mile tunnel to a 1,200,000-hp. installation in Canada's second underground powerhouse. In most aspects this \$225 million Bersimis project compares in size and scope with the great Kitimat project in British Columbia. Bersimis is intended to begin supplying power by the end of 1956.

France.—Serre on the Durance River will be the site of France's first earthfill dam, an 18 million cubic yard structure, which will be 402 feet high.

Africa.—In French Morocco, the \$85 million Bin el Ouidane Dam on el Abid River was completed in the spring of 1955.

The Federation of Rhodesia and Nyasaland was reported in 1955 as decided on going ahead with a \$240 million project to dam the Zambezi River at Kariba Gorge. The lake formed by the 360-foot-high dam would back up 150 miles to Victoria Falls.

In Egypt, the proposed High Dam on the Nile 4 miles south of Aswân Dam had the attention of financial as well as political interests in 1955. The Soviet Union was reported to have offered to build the project in return for trade agreements. The \$600 million project has been envisioned as a 361-foot-high rockfill dam to divert water into an underground powerhouse of nearly 2 million kw. capacity. It would be perhaps 10 years in construction. (See also EGYPT.)

Communist China.—Fu-Tze-Ling Dam—a multi-arched structure called the largest in China—

was reported to have been completed in 1955. It is a multipurpose structure on the Pi River in central China. Its 1,700-foot length is made up of 21 arches.

ARTHUR J. FOX, JR.,
Associate Editor, "Engineering News-Record."

DANCE. Ballet.—During the 1954-55 season, London's Festival Ballet toured the United States for the first time. Under the artistic direction of Anton Dolin, this company of 65 dancers featured Tamara Toumanova, Nora Kovach, Istvan Rabovsky, and Toni Lander as guest artists. When the group made its New York debut with three performances in Brooklyn, Harald Lander's sparkling one-act version of Auguste Bournonville's classic, *Napoli* (music by H. Paulli, E. Helsted, and H. C. Lumbye—décor by Osbert Lancaster), and Michael Charnley's lively *Symphony for Fun* (Don Gillis—Tom Lingwood) met with an enthusiastic welcome. Charnley's *Alice in Wonderland* (Joseph Horowitz—Kenneth Rowell) and Nicholas Beriosoff's reconstruction of Act II of *La Esmeralda* (Cesare Pugni—Nicola Benois) did not fare so well. While on tour, the company presented Frederick Ashton's *Vision of Marguerite* (Liszt—James Bailey). In general, this group of excellent and hard-working dancers was hampered by a not very enterprising repertoire and by the substitution of the star system for a sound artistic policy.

The National Ballet of Canada also gave its first New York performances in Brooklyn. This promising troupe of young dancers, which is directed by Celia Franca and has David Adams and Lois Smith as its principal soloists, made a decidedly favorable impression. Of the new productions, Antony Tudor's engaging farce, *Offenbach in the Underworld*, won special praise, while Joey Harris' *Barbara Allen* (Louis Applebaum—Kay Ambrose), based on the play *Dark of the Moon*, was accorded a cool reception. Later, in Washington, D.C., the company offered Elizabeth Leese's *Lady from the Sea* (music by Saul Honigman).

The New York City Ballet introduced four new works choreographed by George Balanchine. *Western Symphony* (Hershy Kay—John Boyt), a divertissement which blended classical ballet technique with American folk dance formations, scored an immediate hit with the public. The critics, however, preferred the more original and imaginative *Ivesiana*, set to six short orchestral pieces by the late American composer, Charles Ives. *Pas de Trois No. II* (Glinka) was another delectable display piece, but *Roma* (Bizet—Eugene Berman) seemed thin and artificial. In the winter, the company played an unprecedented seven-week season, during which the only ballet given was the popular full-evening *Nutcracker*; this was said to be the longest continuous run in American ballet history for a single dance work. The group later embarked on its fourth European tour and appeared in Paris in June as part of the "Salute to France" festival, sponsored by the Performing Arts International Exchange Program, which is administered by the American National Theatre and Academy (ANTA) on behalf of the State Department.

The Ballet Theatre climaxed its 15th anniversary season with an ambitious three-week engagement at the Metropolitan Opera House in April. The only novelty was the American pre-

Matt Turney in Martha Graham's *Seraphic Dialogue*, based on the legend of St. Joan and premiered in May 1955.

COURTESY OF DANCE MAGAZINE

mière of David Lichine's clever modernization of a classic theme, *The Sphinx* (Henri Sauguet—Christian Bérard), but the season was chiefly memorable for the revivals of ten famous ballets restaged by such choreographers as Tudor, Dolin, Leonide Massine, and Agnes de Mille. An imposing list of guest artists, many of them former members of the company, returned to create their original roles. In June, the group started on a five-month Latin American tour under the auspices of ANTA's International Exchange Program.

The reorganized Ballet Russe de Monte Carlo, headed by Frederic Franklin and guest ballerina Maria Tallchief, made its first transcontinental tour in two years, and during the summer gave a single performance at New York's Lewisohn Stadium. Two new ballets were created for the company: Massine's *Harold in Italy* (Berlioz—Bernard Lamotte) and Antonia Cobos' *The Mikado* (Sir Arthur Sullivan—Lamotte).

The Metropolitan Opera Company produced its first independent ballet since the late 1930's. This was *Vittorio* (Verdi—Esteban Francés), devised by the resident choreographer and ballet director, Zachary Solov, who also danced the title role with Mía Slavenska. Although this melodramatic work in the operatic style failed to arouse much enthusiasm, it at least indicated that the Metropolitan's directors have realized the importance of building a genuine ballet company at the opera house.

Concert Dance.—The outstanding event of the season was the second festival of "American Dance," sponsored by the B. de Rothschild Foundation, at a Broadway theater in May. Among the participating companies were those of Martha Graham, José Limón, Pearl Lang, John Butler, Valerie Bettis, and Anna Sokolow, while Janet Collins, Paul Draper, Ann Halprin, Pauline Koner, Daniel Nagrin, and Iris Mabry appeared as solo dancers in their own works. The repertoire, which consisted of 26 group works and 19 solos, featured the American première of Miss Graham's group composition, *Ardent Song* (Alan Hovhaness); *Seraphic Dialogue*, another new group work by Miss Graham, employing the score by Norman Dello Joio for her earlier solo, *The Triumph of St. Joan*; and a new version of her *Theatre for a Voyage* (William Schuman). New solos were danced by Miss Bettis (*The Golden Round*) and Miss Collins (*Bird of Paradise*).

The Juilliard Dance Theatre, a group of 16 young dancers organized in the fall of 1954 under the direction of Doris Humphrey, got off to a commendable start in April 1955 with the premières of Miss Humphrey's *The Rock and the Spring* (Frank Martin) and Miss Sokolow's *Primavera* (Arthur Benjamin). Other New York debuts were made by the newly formed Dance Drama Company, headed by Emily Frankel and Mark Ryder; *To Yo Za*, or the Theatre of the Far East, a group of three dancers; and John Begg's Ballet Carnival. An evening devoted to the ballets of Robert Joffrey presented his *Pierrot Lunaire* (Schönberg) and *Harpichord Concerto* (de Falla). Important new works by Anna Sokolow (*Rooms*), Jean Erdman (*Strange Hunt*), May O'Donnell (*Incredible Adventure*), Merce Cunningham (*Minutiae*), and Pearl Lang (*And Joy Is My Witness*) were seen for the first time in New York. The Spanish dance was represented by Broadway engagements of Vicente Escudero and his company, the Ballets Espagnols of Teresa and Luisillo, and Hurtado de Cordoba

Members of Royal Danish Ballet appeared at Jacob's Pillow, Massachusetts, dance festival, in July 1955.

and his Ballet Español. José Limón's company toured Latin America for the first time under the sponsorship of the International Exchange Program.

Concert appearances were made by the companies of Mary Anthony, Alan Banks, Bhanumati, Shirley Broughton, Ethel Butler, John Butler, Jean-Léon Destiné, José Greco, Bill Hooks, Myra Kinch, Maxine Munt-Alfred Brooks, Nala Najan, Natanya Neumann, Walter Nicks, Priyagopal, Florita Raup, Thomas Ribbink, Orest Sergievsky, Edith Stephen, Tao Strong, Sahomi Tachibana, James Waring, and Ethel Winter. Notable solo and joint recitals were given by Birgit Akesson, Paul Draper, Maria Fenton, Annabelle Gold, Inesita, William Kane, Marie Marchowsky, Merle Marsciano, Helen McGehee, Shanta Rao, Sybil Shearer, Marina Svetlova, Maria Theresa, Helen "Mahealani" Williams; Carola Goya and Matteo; and Federico Rey and Pilar Gomez.

The eighth annual American Dance festival took place in New London, Conn., in August, and offered new group works by Humphrey (*Airs and Graces*) and Limón (*Symphony for Strings and Scherzo*); a trio by Pauline Koner (*Concertino in A Major*); and duets by Ruth Currier (*Idyl* and *The Antagonists*) and by Lucas Hoving and Lavina Nielsen (*Satyros and Ballad*). Ten members of the Royal Danish Ballet made a successful American debut at the Jacob's Pillow Dance Festival in July.

Europe.—In London, the Sadler's Wells Ballet mounted three new one-act works by Frederick Ashton: *Rinaldo* and *Armida* (Malcolm Arnold—Peter Rice), *Variations on a Theme of Purcell* (Benjamin Britten—Peter Snow), and *Madame Chrysanthème* (Alan Rawsthorne—Isabel Lambert). The company opened its fourth American tour in New York in September 1955. The Sadler's Wells Theatre Ballet, which will tour the greater part of every year, premièred two ballets by Kenneth Macmillan: *Dances Concertantes* (Stravinsky—Nicholas Georgiadis) and *House of Birds* (Federico Mompou—Georgiadis). Ballet Rambert also presented a work by Macmillan, *Laidrette* (Frank Martin—Kenneth Rowell), as well as the English premières of two ballets by the young American choreographer, Robert Joffrey: *Pas de Déeses* (John Field) and *Persephone* (Vivaldi—Harri Wich). After its return to England, the Festival Ballet augmented its repertoire with Solov's *Mlle. Fifi* (Théodore Lajarte) and Lander's *Etudes* (Czerny).

In Paris, the Opéra Ballet produced Serge Lifar's *Les Noces Fantastiques* (Marcel Delan-

noy—Roger Chastel) and John Cranko's *La Belle Hélène* (Offenbach—Marcel Vertès). The Grand Ballet du Marquis de Cuevas enjoyed another successful season that featured a number of novelties. These included George Skibine's *Achille* (François de la Rochefoucauld—Pellerin), *La Reine Insolente* (François Serrette—Camille Hiller), and *Le Retour* (Prokofiev—Stanislas Leprie); Paul Goubé's *Duo* (Scriabin) and *Le Lien* (Franck—Manolo Muntanola); Léone Mail's *Jeanne d'Arc* (Phillippe Gerard); Vladimir Skouratoff's *Scarlatina* (Alfredo Casella—Gino Severini); and revivals of Bronislava Nijinska's *Concerto de Chopin* and *Bolero*. This company participated in a special presentation of Berlioz's dramatic symphony, *Roméo et Juliette*, which was staged as an opera-ballet in the courtyard of the Louvre Palace, with décor by François Ganeau, and choreography by John Taras, Serge Golovine, Skibine, and Skouratoff.

At the Berlin Festival in the fall of 1954, Tatjana Gsovsky choreographed *Pelleas und Melisande* (Max Baumann—Ita Maximowna) and *Der Rote Mantel* (Luigi Nono—Jean-Pierre Ponnelle). Her Dance Theater-Berlin began its first American tour in October 1955. In Copenhagen, the Royal Danish Ballet invited Ashton to create a full-length production of *Romeo and Juliet* (Prokofiev—Peter Rice). In Italy, the first International Ballet Festival was held in July at Nervi, near Genoa.

Writer and Researcher.

DATES. See FRUITS.

DAVILA, Carlos Guillermo, Chilean diplomat and journalist: b. Los Angeles, Chile, Sept. 15, 1887; d. Washington, D.C., Oct. 19, 1955. An authority on Latin American life, he worked untiringly both as journalist and diplomat in behalf of greater understanding and goodwill among the nations of North and South America.

Graduated from the University of Chile, Carlos Dávila rejected a career in law to become a journalist. In 1914 he joined the conservative Santiago newspaper, *El Mercurio*, with which he remained until 1917 when he established *La Nación* in the same city. In 1925 he founded another paper, *Los Tiempos*, which became a vehicle for his advocacy of social reform in Chile.

In 1927 Dávila left *La Nación* to become ambassador to the United States until 1932, in which capacity he did much to broaden North American understanding of the Latin American people. He was also instrumental in negotiating a peaceful solution to the 50-year-old Tacna-Arica boundary dispute between Chile and Peru, which had been submitted to President Herbert Hoover for arbitration. Having returned to Chile by March 1932, after the overthrow of the government of Carlos Ibáñez del Canipo, he founded *Hoy*, a news magazine, and launched a campaign against the regime of President Juan Estaban Montero. With the overthrow of the latter on June 4, 1932, Dávila was named provisional president of Chile, and thereafter he embarked on a program of socializing the economy. On September 13, after an army revolt, he resigned and went to the United States. There in 1933, with Joshua Powers, he established the Editors' Press Service, a news agency which specialized in disseminating economic, political, and cultural news about the United States to Latin American newspapers.

With the advent of the liberal Popular Front government of Pedro Aguirre Cerda in Decem-

ber 1938, Dávila was named Chilean representative on the Inter-American Financial and Economic Advisory Committee, which met in Washington in 1940, and was largely responsible for the establishment of the Inter-American Development Committee, the purpose of which was the economic integration of American states. A staunch advocate of the United Nations, he served as a member of the U.N. Relief and Rehabilitation Administration (UNRRA) from 1943 to 1946, when he became a member of the U.N. Economic and Social Council.

Dávila was recalled to Chile to resume his editorship of *La Nación* early in 1954, but in June he was elected secretary general of the Organization of American States, a post he held with distinction until his death. He was the author of the well-received *We of the Americas* (1949).

DAVIS, John William, American attorney and political leader: b. Clarksburg, W.Va., April 13, 1873; d. Charleston, S.C., March 24, 1955. An outstanding authority on constitutional law, he identified his political philosophy with the ideals of Jeffersonian Democracy, arguing in behalf of individual freedom, private property, and states' rights. He was the unsuccessful Democratic candidate for president in the election of 1924.

John W. Davis received his formal education from Washington and Lee University (B.A., 1892; LL.B., 1895). After teaching a year (1896-97) at the law school there, he entered a law partnership with his father, and in a short time established a reputation as a brilliant liberal attorney. He became active in politics in 1899, when he was elected on the Democratic ticket to the West Virginia House of Delegates. In 1910 he won a seat in the 62d Congress from West Virginia's normally Republican 1st District. As a member of the House Judiciary Committee, he played an important role in the reformation of federal court procedure, and assisted in drafting the Clayton Anti-Trust Act (1914), which, among other provisions, exempted unions from the jurisdiction of the Sherman Anti-Trust Act (1890). In 1912, Davis was re-elected to Congress, but on Aug. 30, 1913, he resigned his seat to accept appointment by President Woodrow Wilson as solicitor general.

After serving briefly on the United States commission which negotiated with Germany in Bern, Switzerland, on the treatment and exchange of World War I prisoners of war, Davis was appointed ambassador to Great Britain in November 1918. He also served with the United States delegation at the Versailles Treaty Conference, and played a prominent part in the development of a program for the control of occupied territory. With the election of Warren Harding to the presidency, Davis resigned his ambassadorship on March 21, 1921, and returned to practice law in New York City. He was elected president of the American Bar Association in 1922.

At the stormy Democratic National Convention of 1924, in which neither William G. McAdoo nor Alfred E. Smith was able to obtain the necessary two-thirds majority, Davis emerged from a "dark-horse" position to be nominated on the 103d ballot. He was defeated in the November elections by the Republican candidate, Calvin Coolidge. His popular vote was 8,378,962 (136 electoral votes), compared with 15,718,789 (382) for Coolidge, and 4,822,319 (13) for Robert La Follette, Sr., who ran as a Progressive.

In the 1932 presidential campaign, Davis supported the candidacy of Franklin D. Roosevelt, but soon afterward voiced disapproval of the president's drastic economic policies. He claimed that the New Deal was a dangerous departure from the Jeffersonian ideals of individualism and private property. Thus in 1935, along with other conservative Democrats who assertedly believed as he did that "human rights and the rights of property are not different or antagonistic," he helped found the American Liberty League to combat the administration's domestic innovations. He opposed Roosevelt's reelection in 1936 and 1940; but in May 1941 he appealed to the nation in behalf of the president's foreign policy, and in December 1944 he urged acceptance of a United Nations Organization suggested at the Dumbarton Oaks Conference.

During his career, Davis appeared in 140 constitutional cases before the Supreme Court. The tenor of his interpretation of constitutional law is indicated by the stands he took on the historic cases involving President Truman's seizure of certain steel mills in 1952, after prolonged labor disputes, and the demand of the National Association for the Advancement of Colored People for the termination of racial segregation in public schools.

In May 1952, arguing in behalf of the dispossessed steel companies, he claimed that the "inherent powers" delegated to the executive by the Constitution did not, under the circumstances, provide it with authority to seize private property, a view upheld by the Supreme Court in its decision of June 2, 1952. In December 1952 and again in December 1953, as council for South Carolina, he contended that public-school segregation was not expressly prohibited by the 14th Amendment, and that

the "police powers" delegated to the states by the Constitution rendered segregation legal as long as equal facilities were provided, a view rejected by the Supreme Court in its decision of May 17, 1954. Davis' last important case was his defense of J. Robert Oppenheimer, atomic physicist, in June 1954.

DEAFNESS. See Index entry.

DEAN, James, American actor: b. Marion, Ind., Feb. 8, 1931; d. (in automobile accident), near Paso Robles, Calif., Sept. 30, 1955. After spending two years as a pre-law student at the University of California at Los Angeles, James Dean turned to acting. He played bit parts in motion pictures before winning attention in 1954 for his performance as a young Arab servant in the Broadway play, *The Immoralist*.

His roles as a shy, moody, inarticulate adolescent in the films *East of Eden* and *Rebel Without a Cause* in 1955 brought him acclaim as the most promising new motion picture actor of the year. On December 6 he was selected as the winner of the first Audience Awards election, sponsored by the Council of Motion Pictures Organizations, for the best performance by a male actor in pictures released from Oct. 1, 1954, to Sept. 30, 1955. Several days after completing his third film, *Giant*, he was killed while driving his Porsche Spyder sports car en route to a sports car meeting at Salinas.

DEATH, Causes of. The death rate for the United States fell to a record low of 9.2 per 1,000 population in 1954 after having remained nearly stationary at 9.6 or 9.7 for the five previous years.

DEATHS AND DEATH RATES FOR 33 SELECTED CAUSES: UNITED STATES, 1953 AND 1954

(Exclusive of fetal deaths and of deaths among armed forces overseas. Rates per 100,000 estimated midyear population, excluding armed forces overseas. Numbers after causes of death are category numbers of the Sixth Revision of the International Lists, 1948)

Cause of death	Category	Number		Rate	
		1954*	1953 (final)	1954*	1953 (final)
<i>All causes</i>		1,481,000	1,517,541	918.8	958.6

All other causes.....	Residual	96,510	98,713	59.9	62.4

* Figures for 1954 are estimates based on a 10% sample of death certificates. The sampling error varies with the number of deaths. For example, the estimate for diseases of the heart is subject to an error of 0.3%, and for syphilis, 4%. Typhoid fever, with only 60 deaths, is subject to an error of 39%. (Source: National Office of Vital Statistics, U.S. Public Health Service.)

This substantial drop in part reflects the fact that no outbreaks of influenza were reported in 1954, in contrast with outbreaks in the early part of each of the four preceding years. As a consequence, the rates were low not only for influenza and pneumonia, but also for the chronic cardiovascular diseases, which account for over half the deaths in the United States.

Favorable mortality was also evident in the relatively low number of deaths in the first year, 2,000 less than in 1953, although the number of live births increased by 112,000 in 1954 over 1953. Infant mortality reached a new low rate of 26.6 deaths per 1,000 live births. The risk of death from maternal causes continued to decline; in 1954 only 1 maternal death occurred for 1,900 live births (a rate of 5.3 per 10,000 live births).

The remarkable downward trend in mortality from tuberculosis has continued; between 1953 and 1954 the death rate dropped 15% to 10.5 per 100,000 population, about half of what it was in 1951. The death rate for syphilis has also fallen steadily each year since 1936.

The death rate for motor vehicle accidents was somewhat lower in 1954 than in 1953. For all other accidents the rate was the lowest on record, 33.8 per 100,000 population. Among persons aged 1 to 34 years, more deaths resulted from accidents than from any other cause. (See also ACCIDENTS.)

The heaviest toll in lives was taken by the chronic diseases, which strike hardest in the later years of life. In 1954 the death rate for malignant neoplasms continued to rise. Between 1953 and 1954 the death rates for most of the cardiovascular diseases fell as a result of the sharp change in influenza incidence in these two years. Mortality from chronic nephritis continued the decline observed in previous years. The death rate for diabetes, one of the few diseases for which mortality among women is greater than among men, was lower in 1954 than in the previous four years.

HALBERT L. DUNN,

Chief, National Office of Vital Statistics,
U.S. Public Health Service.

DEATHS. For a list of prominent persons who died in 1955, see NECROLOGY.

DEBT, Public and Private. Net public and private debt in the United States totaled \$605.5 billion at the end of 1954, a rise of about \$20.8 billion, or 3.5%, during the year, as compared with a rise of about 5.5% during 1953. Net private debt accounted for 56% of the 1954 total net debt; net federal debt, 38%; and net state and local debt, 6%. Gross public and private debt (before consolidation of borrowers' accounts) rose to \$706.4 billion at the end of 1954, as compared with \$681.7 billion at the end of 1953. The 1954 increases in both net and gross debt were less than in any year since 1949.

In the public debt sector, the net federal debt of \$230.2 billion at the end of 1954 showed an increase of \$2.1 billion (less than 1%) over the 1953 figure, the smallest increase since 1951 and less than half the 1953 increase. New net borrowings by state and local governments, mainly for highway and school construction, amounted to about \$4.8 billion in the fiscal year 1954, resulting in a rise of 17% in net indebtedness, as compared with rises of 11% in each of the two preceding fiscal years.

Important trends in private indebtedness in 1954 were: a rise of nearly \$11 billion in non-farm mortgage debt, associated with near-record

completions of new owner-type dwellings; a rise of nearly \$5 billion in corporate long-term debt, based upon continuing high outlays for new plant and equipment; a decline of over \$6 bil-

DE JONG, Johannes, Dutch cardinal: b. Nes op Ameland, the Netherlands, Sept. 10, 1885; d. Amersfoort, Sept. 8, 1955. As archbishop of Utrecht he became internationally prominent for his open defiance of Nazi authorities during the German occupation of the Netherlands in World War II.

Ordained on Aug. 15, 1908, after preparing for the priesthood at the Archdiocesan Seminary at Rijsenburg, near Utrecht, de Jong continued his studies in Rome, where he took degrees in philosophy in 1910 and theology in 1911. From 1914 to 1931 he taught church history at the seminary in Rijsenburg, and in the latter year became its rector. In 1935 he was appointed coadjutor archbishop of Utrecht and on Feb. 6, 1936, archbishop.

During the German occupation he successfully fought Nazi pressures aimed at gaining the cooperation of the Dutch Catholic population. He also condemned forced labor and persecution of the Jews and, with the aid of Protestant leaders, resisted Nazi encroachment on education. In December 1945, after the liberation of the Netherlands, Archbishop de Jong was created a cardinal by Pope Pius XII. In 1951, the prelate gave up his archdiocese and retired to a convent of the Little Sisters of Our Lady, at Amersfoort, where he remained until his death.

He was the author of a number of theological

works, the most important of which is *Manual of the History of the Church* (4 vols., 1936-37).

DELAWARE. Middle Atlantic state, United States; one of the original 13 states. The "Diamond State" ranks 47th in area and 45th in population (1955) among the 48 states.

Area and Population.—Area: 2,057 square miles (land, 1,978; inland water, 79), divided into Kent, Sussex, and New Castle counties. Population: (1950) 318,085; (est., July 1, 1955) 380,000. Urban places with 1950 populations above 5,000 are: Dover, the capital, 6,223; Elsmere, 5,314; Milford, 5,179; Newark, 6,731; New Castle, 5,396; and Wilmington, 110,356.

Executive.—Chief state officers in 1955:

Governor: J. Caleb Boggs (Republican)

Lieutenant Governor: John W. Rollins, Sr.

Secretary of State: John N. McDowell

Treasurer: Howard Dickerson

Attorney General: J. Donald Craven

Supt. of Public Instruction: George R. Miller, Jr.

Constitution and Judiciary.—The present constitution went into effect in 1897. The Supreme Court comprises three justices; chief justice in 1955 was Clarence A. Southerland.

Legislature.—The General Assembly (Senate, 17 members; House of Representatives, 35) meets in odd-numbered years commencing the first Tuesday in January.

Among major actions, the 1955 regular session of the legislature revised the registration and election laws, restoring the practice of permanent registration; established a state prison system; authorized construction of limited-access roads; and adopted a Korean War veterans bonus.

Finances.—State treasury receipts (1954-55 fiscal year): \$40,837,368.73; expenditures, \$41,933,720.43; treasury balance, \$6,653,212.55; long-term indebtedness, \$84,491,000.

Taxation.—State tax revenue (1954-55 fiscal year): \$34,532,837.86, including \$9,330,105.05 from selective sales taxes and \$12,545,649.91 from individual income taxes. The state has no general sales, corporate income, or poll tax.

Banking.—As of June 30, 1955, the state's 9 national banks had \$35,743,000 in assets, \$18,578,000 in demand deposits, and \$12,848,000 in time deposits; the state's 24 other banks and 36 branches had \$728,398,244.53 in assets, \$432,148,207.55 in demand deposits, and \$209,016,996.44 in time deposits.

Education.—School attendance is compulsory for all between the ages of 7 and 16, inclusive. Estimated operating expenditures for public elementary and secondary schools in the 1954-55 school year were \$18,200,000 (\$335 per pupil). Expenditure for construction and improvements was an estimated \$6,000,000. Teachers' salaries averaged \$4,129 (elementary school teachers, \$4,006; high school teachers, \$4,278).

During 1954-55 there were 105 public school districts which employed 1,126 elementary school teachers serving 37,921 pupils, and 822 secondary school teachers serving 22,547 pupils.

Social Welfare.—Public assistance expenditures from federal and state funds (excluding institutional costs) in the 1954-55 fiscal year totaled \$2,991,156, including \$857,012 for old-age assistance, \$1,111,672 for dependent children, and \$156,502.75 for the needy blind. A monthly average of 8,554 persons received public assistance. Operating expenditures for health and welfare institutions were \$6,331,447.50.

DELAWARE WELFARE INSTITUTIONS

Type of institution	No.	Pop.*
Hospitals for mentally deficient and epileptic	1	480
Hospitals for the mentally ill	1	1,390
Preventive psychiatric centers	1	200
Sanatoriums for the tuberculous (Sept. 6, 1955)	1	223
Hospitals for crippled children	2	85
Homes for the aged (Sept. 7, 1955)	1	430
Reformatories for males	1	91
Reformatories for females	2	63

* As of Aug. 1, 1955, unless otherwise noted.

Labor Force.—As of March 15, 1955, there were 109,807 insured persons in nonagricultural establishments, and for the year ending March 15, 1955, an average of 111,639. There were

1,900 registered unemployed workers in June 1955, and \$3,067,605 in unemployment compensation claims was paid to insured workers in the 12 months ending June 30, 1955.

Manufacturing.—In 1954, establishments numbering 562 had 62,480 employees. There were 58,550 employees in 1953 who received \$255,801,000 in salaries and wages; value added by manufacture was \$378,975,000, and investment in new plant and equipment, \$26,455,508. Earnings of production workers in manufacturing averaged \$70.90 for an average work week of 39.9 hours in 1954 and \$76.38 for 41.2 hours in the first six months of 1955.

MAJOR DELAWARE MANUFACTURES, 1953

Product or industry	No. of employees ¹	Salaries and wages (thousands of dollars)	Value added by mfr. ² (thousands of dollars)
Chemicals and allied products	7,244	\$30,451	\$101,297
Transportation equipment	3,391	16,324	50,988
Food and kindred products	4,903 ³	12,252 ³	31,192 ³
Primary metal industries	4,160	18,751	25,703

Textile mill products	2,580	9,206	15,392
Leather and leather products	2,235	8,018	10,851

¹ Average per year. ² Value of products less cost of materials, supplies, fuel, electric energy, and contract work. ³ 1952 figures. (Source: *Annual Survey of Manufactures, 1953*.)

Mining.—The mineral output of Delaware, the smallest of that recorded for any of the states, consists almost exclusively of building materials. The 1953 production, valued at \$658,997, comprised 520,817 short tons of sand and gravel (\$399,685), 80,364 tons of stone (\$215,382), and other minerals valued at \$43,930.

Fisheries.—Commercial fishermen in 1953 numbered 1,050. Their catch comprised 5,359,000 pounds of shellfish valued at \$2,049,000 and 362,141,000 pounds of fish (\$4,117,000). Chief species were menhaden, 360,844,000 pounds (\$3,969,000); and oysters, 3,142,000 pounds (\$1,565,000).

Agriculture.—Cash farm income in the first half of 1955 totaled \$43,342,000, and for the full year 1954 comprised \$73,705,000 from livestock and livestock products, \$24,916,000 from crops, and \$390,000 from government payments. Receipts from principal crops and livestock in 1954 included: broilers (\$48,916,000), dairy products (\$9,272,000), corn (\$5,258,000), soybeans (\$2,939,000), and greenhouse and nursery products (\$2,651,000).

The state's 6,297 farms (814,316 acres; harvested cropland, 412,295) averaged 129.3 acres and \$18,692 in value of land and buildings per farm. Some 5,300 farms had telephones, and 5,993 had electricity. Livestock on farms (Jan. 1, 1955) included 78,000 cattle and 1,030,000 chickens (not including commercial broilers). In the week of Oct. 24-30, 1954, there were 13,716 family and hired workers engaged in farming.

DELAWARE CROP STATISTICS

Crop (and unit of production)	Average 1944-53	1954	Est. 1955
Apples (1,000 bu.)	361	280	220
Corn (1,000 bu.)	4,992	5,332	5,100
Potatoes (1,000 bu.)	582	2,002	2,990
Soybeans (1,000 bu.)	762	1,190	1,482
Wheat (1,000 bu.)	1,152	840	858

(Source: U.S. Dept. of Agriculture.)

Transportation and Communications.—State and federal funds disbursed for roads and highways in 1954 totaled \$10,750,000, and newly completed construction aggregated 134 miles.

Highways and roads on June 30, 1955, totaled 3,957.4 miles (3,293.5 surfaced). Registered *motor vehicles* numbered 154,308 on July 31, 1955, including 115,776 passenger cars. There were 3 *railroads* (1955) operating 923 line miles, and 3 regularly scheduled *airlines* and 15 *airports and airfields* (11 commercial and municipal, 1 military, and 3 private).

Communications media included (1955) 1 FM and 4 AM *radio stations* and 1 VHF operating *television outlet*; 2 daily *newspapers* (circulation, 89,307) and 15 other *newspapers* (circulation, 40,246); and (Jan. 1, 1955) 46,877 business and 106,102 residential *telephones*.

Principal Events, 1955.—Many after effects of the 1954 row over the segregation of schools in Milford plagued Delaware in 1955. Bryant Bowles, head of the National Association for the Advancement of White People, who had taken the leading public role in the movement to retain segregation in Delaware, moved to the state in January and announced a campaign to oust officials who had supported integration. Many Milford teachers and administrators subsequently resigned, and a new Milford school board which had Bowles' backing—unasked, it declared—was elected on May 15. The Delaware Supreme Court had on February 8 upheld the previous board's action in removing Negro pupils from Milford High School, but the grounds were that proper admission procedures had not been followed, the court stating that Delaware's segregation laws had definitely been nullified by the U.S. Supreme Court decision of May 17, 1954.

Integration, however, slowly gained ground in Delaware schools. By September 1955 more than one tenth of all Negro students were being taught in mixed classes, although no such classes were meeting south of Dover.

Although the governor, J. Caleb Boggs, was a Republican, the unusual Democratic majority in the General Assembly was so large that an extraordinary number of bills was passed over his veto, and the composition of many commissions and agencies was changed. To retain control of affairs, the assembly did not adjourn in the summer sine die as was customary, but took long recesses, continuing its work through occasional evening sessions.

The rate of Delaware's population increase was continuing higher than in any other Eastern state except Florida and ranked fifth highest of all the states. A notable evidence of industrial growth was the construction of a large refinery north of Delaware City by the Tide Water Associated Oil Company. To make way for the refinery, King's College moved to New York State. Increasing industrial, agricultural, and domestic use of water led Governor Boggs to appoint a committee to examine water resources and make recommendations for their efficient use.

Principal Events by: JOHN A. MUNROE, *Chairman, Department of History, University of Delaware; Author, "Federalist Delaware, 1775-1815" (1954).*

DEMOCRATIC PARTY. Presidential politics of 1956 overshadowed all other Democratic activities in 1955. Leading prospective candidates for the party nomination in 1956 were the 1952 nominee, former Gov. Adlai E. Stevenson (q.v.) of Illinois (who made a formal announcement of candidacy on November 15), Gov. Averell Harriman (q.v.) of New York, and Sen. Estes Kefauver (q.v.) of Tennessee (who tossed his coonskin cap into the ring on December 16). Gov. Frank J. Lausche of Ohio announced his candidacy as a "favorite son" on December 14, and Gov. C. Menen Williams was considered a possible "favorite son" entry from Michigan. Sen. Richard B. Russell

of Georgia, a prominent candidate in the 1952 convention, indicated his intention not to enter the race. Speculation over the possible candidacy of Sen. Lyndon B. Johnson of Texas, Senate majority leader, diminished sharply after his temporarily disabling heart attack.

Stevenson's name tended to be in the forefront by virtue of a series of endorsements by important Democrats, among them governors and senators; because of his occasional major addresses; as a result of favorable newspaper reaction; and as a consequence of his lead among Democratic candidates in public opinion polls. Governor Harriman's friends, among whom Tammany leader Carmine DeSapio was a principal spokesman, seemed to be avoiding for him the role of an early leading candidate with its danger of setting up "a man to beat." Senator Kefauver, enjoying significant organized support in several states, surveyed the political situation with the distinct likelihood that he would enter some of the 19 presidential preferential primaries. Many of Stevenson's friends urged him to enter only a few primaries where prospects for victory would be clear. Harriman stated that he would not enter any primaries.

Democrats in 1955 held majorities in both houses of Congress and occupied 27 of the state governorships. Party optimism for 1956 ran high, particularly because President Eisenhower's candidacy for re-election seemed far less probable after his moderate heart attack on September 24. As a consequence also, the Democratic nomination immediately became more significant. Because of the president's clear popularity, many Democrats preferred not to direct political criticism against him personally, but others, notably the national chairman, Paul M. Butler, believed that Democrats should level attacks against the president.

The party chose Chicago for its 1956 national convention, which was scheduled to open on August 13, one week before the Republican convention. Because of later nominating conventions, the campaign period was to be shorter than usual. Television was expected to play a much greater role in the campaign than before.

Democratic leaders, especially those in Congress, were already placing major emphasis on such issues for the 1956 campaign as increased farm price supports, lower taxation for small-income groups, development of public power, federal aid for public school construction, outlays for flood control, and more liberal social security benefits. A program to win the farm vote was considered of paramount importance in party planning. National advisory groups on agriculture, labor, small business, natural resources, veterans affairs, and party structure were being set up by the national committee.

Elections in 1955 were generally encouraging to Democrats, although many contests involved primarily local issues. On April 4, Michigan Democrats gained statewide judicial and school offices, although in Chicago on April 5, Richard J. Daley was elected mayor by a smaller majority than usual for a Democrat. On November 8, Democrats went into the election in Indiana with control of 32 cities and emerged with control of 72, including Indianapolis, against 30 in Republican hands. The party easily retained control of Philadelphia (q.v.) and increased its strength elsewhere in Pennsylvania and in New York State, Connecticut, and Kentucky where A. B. "Happy" Chandler was overwhelmingly elected governor. (See also ELECTIONS.)

DENMARK. A northern European kingdom, located north of Germany and south of Norway, Denmark comprises the peninsula of Jutland (Jylland), which projects into the North Sea; the adjacent islands of Zealand (Sjælland), Fyn (Fünen, Fyen), Lolland (Laaland), Falster, and Bornholm (south of Sweden); about 500 smaller nearby islands (100 of which are inhabited); the Faeroe (Faroe) Islands in the Atlantic between Iceland and Scotland; and Greenland (Groenland). Its area, exclusive of Greenland and the Faeroes (qq.v.), is 16,576 square miles; and its estimated 1954 population was 4,405,000. The principal cities, with their populations (census of Nov. 7, 1950) are Copenhagen, the capital, 974,901 (greater Copenhagen, 1,166,204); Aarhus, 116,167; Odense, 100,940; and Aalborg, 79,806.

Government.—The Danish constitution dates from 1849 and was amended in 1915 (universal suffrage), 1920, and 1953. The king (Frederik IX, who succeeded to the throne on April 20, 1947, upon the death of his father, King Christian X) holds executive power and acts through a cabinet responsible to the Folketing (Parliament).

Hans Christian Hansen became premier on Feb. 1, 1955, and heads a Social Democratic minority government of 15 members, which has been in office since Sept. 30, 1953. The Folketing, with 135 seats elected through proportional representation and 40 seats divided among parties not having sufficient election returns for membership, has 179 members elected for 4 years. The minimum voting age is 23 years.

The last general election was held on Sept. 22, 1953, following which the Folketing consisted of 74 Social Democrats, 42 Moderate Liberals (Agrarians), 30 Conservatives, 14 Social Liberals (Radicals), 8 Communists, 6 Georgists (Single Taxers), 2 from the Faeroe Islands, 2 from Greenland, and 1 from the German minority living near the Danish-German frontier.

Denmark is a member of the United Nations, the Council of Europe, and the North Atlantic Treaty Organization, but not of the Western European Union.

Education.—Education is compulsory from the age of 7 to 14. In 1953 there were 3,545 elementary, 495 middle, and 35 secondary schools; 58 private colleges (folk schools), and 23 teacher-training colleges. There are extensive facilities for adult education through rural colleges and evening courses. In addition to the universities of Copenhagen and Aarhus, there are polytechnic, agricultural, and business schools of university grade. Most educational institutions are public and free.

Religion.—The Evangelical Lutheran Church, headed by the king, is the established church in Denmark. Less than 100,000 persons are outside this church, but complete toleration exists for all sects.

Social Legislation.—The social security system covers sickness insurance, old-age and disability insurance, unemployment insurance, and insurance for industrial injuries. Members of government-subsidized sickness insurance funds, which on a voluntary basis cover 80% of the population, have the right to free medical assistance and free hospitalization. In some instances, below-cost medicine is available. Disability pensions are paid to persons whose working capacity is reduced to about one third, and old-age pensions to persons of small means who attain the age of 65 years (single women, 60 years). All expectant mothers are entitled to free examinations by a doctor and to midwife service at the delivery. In 1955 a new act concerning maintenance of widows was passed. Families of moderate means with two or more children are entitled to a rent allowance of from 20% to 75% of the rent. In order to promote housing construction, government loans are granted for all types of housing where flats do not exceed a certain size. Public expenditures for social welfare, including health, for the fiscal year 1952-53 amounted to 2,100 million kroner, 10% of the national income.

Finance.—The public accounts for the fiscal year 1954-55 balanced at 3,312 million kroner (1 kroner = U.S.\$0.14,478), with a surplus of 26 million kroner. The gross national product and income in 1954 was 29.7 billion kroner, 1 billion kroner more than in 1953. Total aid to Denmark under the European Recovery Program and the Defense Support Aid Program during the financial years 1948-54 amounted to U.S.\$297 million.

Production.—Agriculture and allied pursuits engage 27.1% of the Danish population; handicraft and industry, 30.7%; and other trades, 42.2%. Of the total area of 10.6 million acres, 8 million are considered to be agricultural land.

The country affords good conditions for agriculture, forestry, and fisheries, and is industrially advanced despite few raw materials. The forest area is small but productive. Both coastal and deep-sea fishing are carried on intensively.

There are 208,000 farm holdings in Denmark, averaging 38 acres each. In 1954 milk production totaled 11,900 million pounds; pork, 1,060; beef and veal, 450; butter, 400; eggs, 310; and cheese, 180.

In 1955, 41.5% of agricultural land was planted in grain. There is some commercial gardening and fruit growing. Final results, in metric tons, of the 1954 harvest were: wheat, 292,000; rye, 276,000; barley, 2,045,000; oats, 820,000; mixed grains and legumes, 798,000; sugar beets for fodder, 1,353,000; and sugar beets for manufacture, 1,694,000.

Clay and chalk on Jutland's east coast provide materials for a large cement industry (1,019,000 metric tons in 1954). The iron and metal industry and the textile and clothing industries are large consumers of foreign raw materials. Other important industries are brewing, industrial and edible oils, leather, and wood products. Danish china, stoneware, and silver are considered to be among the best and loveliest in the world. The general index of industrial production (1935 = 100) averaged 183 for the first half of 1955, as compared with 180 for the full year 1954.

Fishing provided a livelihood for 14,500 persons in 1950, with about 5,400 others finding an extra source of income in this occupation. Herring, cod, plaice, and fish for industrial purposes comprise the bulk of the catch, which in 1954 had an estimated value of 225 million kroner.

Foreign Trade.—Exports in 1954 amounted to 6,550 million kroner, and imports were valued at 8,034 million kroner. Thus, the total import surplus was 1,484 million kroner, compared with 730 million kroner in 1953. This feature, which has marked Danish economy since World War II, has caused permanent scarcity of foreign currency. As a result the Danish debt to the European Payments Union (U.S.\$236.4 million in August 1955) has increased. To counteract this development the government has endeavored to restrict home consumption through higher taxes and duties, and by overbalancing the budget.

During the second half of 1955, the export of industrial goods increased; and after Oct. 1, 1955, Denmark received essentially higher prices for agricultural products, including butter (8,844 metric tons exported during the first half of 1955). Denmark's major countries of trade, with 1954 value in thousands of kroner, are the United Kingdom (exports, 2,399,578; imports, 2,156,126), Germany (1,006,541; 1,656,055), the United States (489,091; 395,750), and Sweden (429,217; 743,974).

Transportation and Communication.—The Danish railway network (including train ferries) consists of 3,120 miles, of which more than half—including all main lines—is owned by the central government. On Jan. 1, 1953, there were 5,146 miles of main highways and 28,108 miles of byroads; and on Jan. 1, 1955, there were 385,300 motor vehicles of all types. During 1954 the merchant fleet increased by 159,600 gross tons to a total of 1,585,000 gross tons.

As of Jan. 1, 1954, there were 825,879 telephones; and in April 1955 there were 1,327,000 registered radio receivers. The broadcasting system is operated by the government, and Denmark has regular television broadcasts.

Principal Events, 1955.—Following the death of

Premier Hans Hedtoft (q.v.) on Jan. 29, 1955, the foreign minister, Hans Christian Hansen, was appointed by the king to the premiership, holding it concurrently with his former post.

On March 8 the Danish government announced that it had appointed a commission, headed by Niels Bohr, to develop peaceful uses of atomic energy and to cooperate with the American and British commissions.

In the field of foreign affairs, Denmark and West Germany signed a treaty in March which settled the contested rights of German and Danish minorities within the respective countries; and on April 19 the Folketing ratified by a large majority (145 to 24) the Paris agreements of Oct. 23, 1954, which permitted West Germany to rearm within NATO.

On April 2, Denmark celebrated the sesquicentennial of the birth of Hans Christian Andersen, beloved writer of children's stories. The main observance was held in Odense, the writer's birthplace.

LITHGOW OSBORNE,
President, American-Scandinavian Foundation.

DENTISTRY. Some of the most interesting and significant items which occurred in the realm of dentistry during the past year are summarized in the following paragraphs.

Prevention.—The ever-widening fight against dental caries has extended to include Egypt. Its principal city of Cairo has now undertaken the artificial fluoridation of its communal water supply. While fluoridation of drinking water is considered the most effective weapon for the control of dental decay in children, it is still somewhat of a controversial issue in the United States. The opponents of fluoridation base their claims on the possible unknown harmful effects of the long-term ingestion of fluoride. They urge a conservative, cautious approach rather than a wholesale fluoridation program. There is also considerable resistance to the compulsory ingestion of a potentially toxic substance, even if in minute doses, for the reduction in incidence of a noncontagious disease.

Although there are about 1,100 communities in the United States whose public water supplies are fluoridated, it is to be noted that at least one municipality has discontinued the program at the wish of its citizens as expressed in a referendum. As a means of determining the wishes of the people on the question, without compulsion, the referendum would appear to be the method of choice.

National Defense.—The so-called doctor draft law, officially known as HR3005, was signed by President Eisenhower on June 30, 1955. By this action, the authority to make special draft calls on dentists and physicians will be continued for two more years. The original enactment, passed in 1950 with the support and approval of the American Dental Association, has been modified in some of its features. According to the new law, the age limit for the drafting of dentists is lowered from 51 to 46 years. It further provides that dentists rejected for a dental commission in the armed forces solely for physical reasons shall no longer be liable for military service upon reaching age 35. The American Dental Association feels that this two-year extension does not help solve the basic problem of creating a Dental Corps with real career appeal which would attract the most qualified personnel.

The strategic and professional value of the

dentist as a member of disaster casualty teams has been recognized and reevaluated. Although dentists are familiar with the basic medical sciences, the anatomy and physiology of the body as a whole, and the use of drugs and anesthetics, the average practitioner has little actual experience in the treatment of body injuries. In the event of a peacetime or wartime disaster, if the dentist were called upon to render casualty care, he would not be able to render such service as efficiently as he should. Recognizing the trend of the times, the Council on Dental Education of the American Dental Association and the Federal Civil Defense Administration are fostering the inclusion of casualty-care courses in the curricula of all dental schools, and well-organized courses of training in this important subject are now being given in several schools throughout the United States. It is anticipated that such courses will be made a permanent requirement in the program of all dental schools.

Electrical Anesthesia.—Dental scientists carrying on the endless search for methods of eliminating pain and suffering paused during the past year to reconsider the potentialities of what may be termed "electrical anesthesia" for dental cavity preparation. While the idea is not new, attention has recently been focused on its promising possibilities. By the use of a simple, specially designed apparatus, an extremely minute current of electricity is allowed to pass from the operative instrument to the tooth. Experimenters claim that the anesthesia thus produced reduces by a high percentage the pain that may accompany drilling or tooth preparation.

Ultrasonic Drill.—During the past year further research and experimentation has been done on the recently introduced ultrasonic dental drill. This apparatus, designed to cut tooth structure more or less painlessly by applying ultrasonic vibrations to a cutting instrument, has held out considerable promise of becoming a most valuable adjunct to the armamentarium of the dentist. The Dental Information Bureau recently supervised a demonstration of the instrument and its technic, in order to make an accurate appraisal of its development. As a result of this demonstration, the bureau felt that, while the technic still holds promise of great usefulness, it is still, and will be for some time to come, strictly in the experimental stage.

EUGENE S. SOZZI,
Contributing Editor, "Mid-Town Dental Journal," New York City.

DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE. On April 11, 1953, the department was created from the Federal Security Agency, which since 1939 had administered the major programs for the country's health, education, and economic security. The units that constitute the department are: the Social Security Administration, Public Health Service, Office of Education, Food and Drug Administration, Office of Vocational Rehabilitation, Saint Elizabeths Hospital, and three federally aided corporations—Howard University, Gallaudet College, and the American Printing House for the Blind.

The Social Security Administration (see SOCIAL SECURITY) administers the federal system of old-age and survivors insurance, and is also responsible for federal activities in the state-federal public assistance programs for aid to the needy aged, needy blind, dependent children, and permanently and totally disabled persons. Through its Children's Bureau (see CHILD WELFARE),

grants are authorized to states for maternal and child health services, services for crippled children, and child welfare services. Responsibility for promoting the establishment of and supervising the operation of federal credit unions is also lodged with the Social Security Administration.

The Public Health Service (see PUBLIC HEALTH) works with the states on health problems and conducts major research programs in cancer, heart disease, arthritis and metabolic diseases, dental problems, mental health, neurological diseases and blindness, and microbiology. Grants are made by the service to universities, hospitals, and other research organizations for additional research. The hospital survey and construction program is administered by the service.

The Office of Education (q.v.) collects and disseminates information on schools and school systems, colleges and universities, libraries, and programs of instruction and administrative procedures. It serves in an advisory and consultative capacity to school officials, administrative and professional staffs of colleges and universities, representatives of foreign countries, and students of education; and administers grant-in-aid funds for special programs.

The Food and Drug Administration (q.v.) protects consumers and ethical producers by enforcing federal laws prohibiting interstate shipment of impure or mislabeled foods, drugs, and cosmetics.

The Office of Vocational Rehabilitation cooperates with the states in restoring disabled civilians to useful employment by establishing standards, giving technical assistance, and certifying federal grants to states according to a formula set by law.

Also under jurisdiction of the department are Saint Elizabeths Hospital, for the mentally ill; Howard University, for Negroes; and Gallaudet College, for the deaf, each located in Washington, D.C.; and the American Printing House for the Blind, in Louisville, Ky., which provides textbooks, tangible apparatus, and other materials, without cost, to schools for the blind.

M. B. FOLSOM,

Secretary of Health, Education, and Welfare.*

DERMATOLOGY. A variety of practical and theoretical advances marked the progress of dermatology in 1954-55. Some of the more interesting and significant of these are reviewed below.

Syphilis and the Venereal Diseases.—Because of its connotation with respect to the state of public health, it was an encouraging and notable event when Joseph E. Moore, editor of the *American Journal of Syphilis, Gonorrhea and the Venereal Diseases*, was able to conclude publication of his magazine with the November 1954 issue. The incidence of these diseases has diminished—for they are now easy to cure with the antibiotic drugs—and investigative interest in them has waned. With the January 1955 issue, the *A.M.A. Archives of Dermatology and Syphilology* changed its name to *A.M.A. Archives of Dermatology*.

It is noteworthy that the treponema pallidum immobilization and related tests have made the

diagnosis of syphilis serologically almost fool-proof; they approach absolute specificity, according to Charles R. Rein. Tetracycline has been found by A. Maynard and collaborators to be effective in lymphogranuloma venereum.

Glanders.—This infection, although rare in human beings, has been uniformly fatal whenever it occurred in the past. The Turkish Ministry of Health found records of 18 such cases in the decade 1938-48. The first patient to be cured was one treated with streptomycin, penicillin, and sulfadiazine in 1949. Two others have responded to aureomycin and streptomycin, in 1953 and in 1954. It seems that *Malleomyces mallei* may now be added to the list of bacteria no longer greatly to be feared.

Ecthyma Gangrenosum.—A disease of infants that begins with characteristic small ecchymoses and blebs and progresses with ulcerative and gangrenous lesions has long been known by this name. According to A. M. Hand it was recognized in 1917 by E. Fraenkel as a manifestation of *Pseudomonas aeruginosa* septicemia, but this fact has not become common knowledge. Hand was able to cure 3 of 5 cases by the use of polymyxin B. The rash which occurs early in the disease is recognizable clinically, and its presence should make diagnosis possible at a time when treatment may be effectual.

Moist Warts.—Condylomata acuminata are usually treated with podophyllin, an effectual agent popularized in recent years. However, J. W. Ward and collaborators have reported that a pregnant woman with extensive anogenital condylomata was treated with podophyllin, and died of encephalopathy. The drug, despite its topical, not internal, administration, was evidently toxic. Prior to this report, few dermatologists were aware that the external application of podophyllin is attended by the possibility of dangerous percutaneous absorption.

Milkers' Nodules.—Presumably due to a virus and found frequently on the fingers of farmers who contract the disease from cattle, this innocuous infection is interesting but is incompletely understood. For the first time it has been experimentally inoculated from one human being to another, and from the second individual to a third volunteer. C. E. Sonck and K. Penttinen accomplished this by rubbing biopsy material onto the eroded skin of the forearm, but they were not successful in cultivating the virus in vitro.

Pigmentation.—The biochemistry of melanin is under constant study. It has been shown in the past that melanocytes in the albino are present, but, lacking tyrosinase, they are not able to elaborate melanin. In contrast, melanocytes in vitiligo are absent, and in their absence melanin is, of course, not elaborated. A. Kukita and Thomas B. Fitzpatrick studied melanogenesis by autoradiographic methods. They exposed hair bulb explants to solutions of radioactive tyrosine, so that melanocytes containing tyrosinase might be identified. Tyrosinase-containing melanocytes of the hair matrix converted radioactive tyrosine into melanin granules that remained fixed to the mitochondria. After the unfixed labeled tyrosine in solution was washed out, autoradiography demonstrated the presence of the labeled melanin. So tested, the melanocytes of albino hair bulbs were found unable to convert labeled tyrosine into melanin.

Melanotic spots on the lips of patients with intestinal polyposis were described in a classic essay by Harold Jeghers and collaborators in

* Appointed on July 13, 1955 (effective August 1), following the resignation of Oveta Culp Hobby.

1949. Numerous recent publications concerned with the Peutz-Jeghers syndrome, as it is called, have only elaborated on their observations. If a young adult with dark, freckle-like lesions of the oral mucosae, and perhaps of the skin about the nose and on the fingers and toes, suffers with episodes of abdominal pain, cramping, intestinal obstruction, and perhaps rectal bleeding, he probably has intestinal polyposis.

Lupus Erythematosus.—Systemic lupus erythematosus continues to receive intensive study. The "L. E. cell" phenomenon, characterized by necrobiosis, agglutination, and phagocytosis of the nuclei of polymorphonuclear leukocytes, is now known to result not only from the specific disease, but also from the effects of certain drugs. Hydralazine (Apresoline) is one of these. The syndrome it produces in some individuals, when it is ill-tolerated, differs in no particular from systemic lupus erythematosus, and it is responsive to treatment with cortisone and corticotropin. It was observed by J. C. Muller and collaborators in 7 of 53 patients who had received hydralazine for periods of from 4 to 23 months. Richard Weiss and collaborators discovered that the lupus erythematosus-like disease caused by hydralazine can be induced in dogs, so that an experimental animal is now available for the pursuit of investigation.

Books.—Recent significant publications include the second edition of *Précis de mycologie*, by M. Langeron, revised by R. Vanbreuseghem; *Viral and Rickettsial Diseases of the Skin, Eye, and Mucous Membranes*, by Harvey Blank and collaborators; *Physiology and Biochemistry of the Skin*, by Stephen Rothman; and *Systemic Associations and Treatment of Skin Diseases*, by Kurt Wiener.

DETROIT. Fifth largest city in the United States, Detroit, Mich., has an estimated population (1955) of 1,902,000 (1950 census: 1,849,568) in an area of 139.6 square miles. Metropolitan Detroit, including Wayne, Macomb, Oakland, and part of Washtenaw counties, covers 1,965 square miles with a population of 3,515,000 in 1955 (1950 census: 3,016,197).

The city government is nonpartisan, headed by a mayor and nine-man City Council, all elected to four-year terms in 1953. The incumbent mayor is Albert E. Cobo.

Tax budget (1955-56 fiscal year): \$103,486,866. Total city budget: \$214,602,634. School budget (separated for the first time in 1955-56): \$113,219,410. City tax rate (1955): \$35.07 per \$1,000 assessed valuation (includes municipal and school taxes separately assessed). Net long-term debt: \$336,821,000. Public school enrollment (Sept. 30, 1955): 272,528, including 169,584 kindergarten and elementary, 91,240 junior and senior high school, 11,704 trade and special students. Wayne (municipal) University enrollment (1955): 18,499.

Value of imports and exports through the customs district of Michigan (1954): \$1,587,000,000; estimated value in 1955: \$1,750,000,000. Employment in metropolitan area (1955 estimate): 700,000 in manufacturing and 630,000 in nonmanufacturing; unemployment: 60,000. Gross factory product of Wayne County (1955 estimate): \$14 billion. Wayne County retail sales (1955 estimate): \$4.9 billion.

Automobiles made the motor city's two big stories in 1955. Beginning in the summer the United Automobile Workers (CIO) signed a series of three-year labor contracts with the automobile manufacturers which included a new security principle inaccurately called the guaranteed annual wage. By any name, however, the

industry funds set up to pay unemployment benefits supplementary to state-administered insurance were considered a revolutionary economic innovation (see also LABOR). While the National Association of Manufacturers began a fight to outlaw the contracts, CIO President Walter Reuther promised to extend the pattern to other key industries. Each of the UAW negotiations with the big three motor companies was concluded in marathon bargaining sessions that extended a few hours beyond strike deadlines. The resulting work losses, however, were slight.

Strikes, in fact, were unthinkable because Detroit was in the midst of its biggest automobile boom in history. Production in the first three quarters of the year was greater than in any previous full year except 1950 and 1953 (see also AUTOMOBILES). And the boom seemed still young. While turning out about 9 million cars and trucks in 1955, the major manufacturers all announced plans for expansion. At least one resumed production on an overtime basis reminiscent of wartime.

Along the Detroit River the city continued clearing industrial slums and constructing the Civic Center. The City-County Building in the center was opened in 1955, the Ford Auditorium neared completion, and ground was broken for a Convention Hall and Exhibits Building. (See also HIGHWAYS.)

GORDON HARRISON,
Editorial Writer, "The Detroit News."

DE VOTO, Bernard (Augustine), American literary critic, essayist, and historian: b. Ogden, Utah, Jan. 11, 1897; d. New York, N.Y., Nov. 13, 1955. During an unusually varied career as historian, literary critic, and teacher, he won the reputation of being a highly independent and vigorous critic of American culture, especially in his column, "The Easy Chair," in *Harper's Magazine*.

After a year at the University of Utah, he entered Harvard College in the fall of 1915, where philosophy was his main interest and where he studied English under Dean Le Baron Briggs.

Bernard De Voto
(d. Nov. 13, 1955)

WIDE WORLD

Returning to Harvard after World War I, he was graduated in 1920. From 1922 he taught English at Northwestern University until 1927, when he moved to Cambridge, Mass. There, after two years of studying and writing, he became an instructor at Harvard (1929-36). In 1935 he took over for *Harper's* the writing of "The Easy Chair," a post which he was to occupy for the next 20 years. Following two years (1936-38) as editor of the *Saturday Review of Literature*, he returned once more to Cambridge to devote all of his time to writing.

Sometimes compared with H. L. Mencken because of the pungency with which he expressed his opinions, De Voto's strong views on literary questions and social issues kept him almost constantly engaged in controversy, which he greatly enjoyed. During the ideology-dominated late 1930's he refused to assume a definite socio-political position or to subscribe to any of the major literary orthodoxies, most of which he attacked sharply. Civil liberties and the conservation of natural resources were the most frequently discussed of the many causes he championed in his monthly column.

One of the most versatile of contemporary writers, the extraordinarily wide range of his work included light fiction, essays, social history, serious fiction, crusading journalism, and literary criticism. In the trilogy, *The Year of Decision: 1846* (1943); *Across the Wide Missouri* (1947), winner of the 1948 Pulitzer Prize in history; and *The Course of Empire* (1952), he examined in a masterly and scholarly way the Western expansion of America. An authority on Mark Twain, De Voto was the author of several books on that writer, including *Mark Twain's America* (1932). Other of his better-known books are a novel, *We Accept With Pleasure* (1934); *Forays and Rebuttals* (1936), essays; *The Literary Fallacy* (1944), literary criticism; *The World of Fiction* (1950); and *The Easy Chair* (1955), essays from *Harper's*. (See also AMERICAN LITERATURE.)

DISCIPLES OF CHRIST. Total membership in the United States in 1955 was 1,882,377, and world membership, organized in 8,830 congregations, was 2,045,943, with 136,613 new members added during the year preceding. Contributions for the year totaled \$75,955,232.30. The year 1955-56 was being observed with emphasis on the themes "Our Church in a Changing America" and "Our Church A Teaching Church."

Overseas missions are maintained in the Union of South Africa, the Belgian Congo, Argentina, India, Japan, Jamaica, Paraguay, Mexico, the Philippines, Puerto Rico, and Thailand. Christmount, a national Christian Assembly Ground, has been established at Black Mountain, N.C. The Council on Christian Unity was organized in 1955 to extend efforts for church union through lectures and conferences.

Twelve area Christian assemblies were held during the fall of 1955 in Lynchburg, Atlanta, Pittsburgh, Cincinnati, St. Louis, Omaha, Colorado Springs, Spokane, Bakersfield, Wichita, Fort Worth, and Memphis. Their purpose was to review the first five years of the long-range program adopted in 1950 and to make plans for the next five years. The World Convention of Churches of Christ was held in Toronto, August 16-21.

National headquarters of the International Convention of Disciples of Christ are located at 620 K of P Building, Indianapolis, Ind. Publications are the *World Call*, a monthly, and *The Christian-Evangelist*, a weekly.

GAINES M. COOK,
Executive Secretary.

DISNEYLAND

"Casey Jr." carries children through Fantasyland, a section of the Disneyland amusement park.

DISNEYLAND. Located in Anaheim, Orange County, California, 25 miles southeast of downtown Los Angeles, Disneyland is a \$17 million amusement center founded by Walt Disney and comprising five major areas extending in time from the ageless era of fantasy through America's earliest days and into the world of tomorrow. The entire project covers 160 acres, of which 100 are for parking. Disneyland's public opening on July 18, 1955, attracted nearly 30,000 visitors.

First of Disneyland's five areas is Main Street, U.S.A., in which two blocks of shops, all built to scale in the Gay Nineties fashion, and open for business, line the street. A horse-drawn streetcar trundles from Town Square to the Plaza, from which the four "lands" radiate like slices of pie. To the east is Tomorrowland, where science and industry present their plans for the future. Rides such as TWA's Rocket Ride to the Moon and Space Station X-1 are based on factual technical data. Fantasyland, where Disney cartoon characters become animated realities, is entered through a fairyland castle and lies to the north of the Plaza. West of the Plaza is Frontierland, based on early American history and ideals. The *Mark Twain*, a 105-foot stern-wheeler, docks in Frontierland, while the Santa Fe and Disneyland freight train has its station there, and stages, wagons, and mule train can be boarded for trips through simulated mountain and desert country. Adventureland, where tropical rivers and their flora and fauna are represented, is entered through a Polynesian type settlement. Canvas-topped boats steam down the Adventureland river past lifelike animals and cannibals.

According to Walt Disney, Disneyland will not be finished so long as his imagination can create new features for the amusement center. Plans call for the addition of International Street and the opening of Holiday Land in 1956.

C. V. WOOD, JR.,

Vice President and General Manager of Disneyland, Inc.

DISPLACED PERSONS. See REFUGEES AND DISPLACED PERSONS.

DISTILLING INDUSTRY. *Production.*—The production of beverage distilled spirits at registered and fruit distilleries during the fiscal year ended June 30, 1955, compared with audited figures for the fiscal year 1954, was as follows, in tax gallons:*

* As used herein, a tax or proof gallon is a standard United States gallon of 231 cubic inches containing 50% of ethyl alcohol by volume; a wine gallon is a standard United States gallon regardless of proof.

DISTRICT OF COLUMBIA

	July 1, 1954- June 30, 1955	July 1, 1953- June 30, 1954
Whiskey.....	103,927,044	102,541,246
Brandy.....	4,007,868	5,778,596
Rum.....	2,004,883	1,830,164
Gin.....	16,558,549	13,612,183
Vodka.....	2,414,620	867,842
Spirits.....	53,277,317	60,366,997
Total.....	182,190,281	184,997,028

Rectified Spirits.—Data on rectified spirits in the fiscal year 1955, with 1954 figures in parentheses, are as follows: rectifying plants used 81,144,051 proof gallons of domestic and imported spirits (89,562,058); production by rectification amounted to 81,854,638 proof gallons (90,369,825). Whiskey accounted for 72,408,334 gallons of the total production by rectification (77,609,934).

Output for Consumption.—The bottled output of domestic distilled spirits, plus imported spirits bottled after withdrawal from customs warehouses, during the calendar year 1954 totaled 169,231,673 wine gallons, compared with 177,391,900 gallons during 1952, a decrease of 8,160,227 gallons, or 4.6%. Whiskey bottled during 1954 amounted to 137,185,136 wine gallons, accounting for 81% of total distilled spirits bottled, as against 145,638,632 gallons during 1953, or 82.1% of total spirits. Of the total whiskey bottled in 1954, spirit blends amounted to 82,626,746 gallons; bonded, 13,200,392; straight, 39,259,855; and blended straights, 2,098,143. The remainder of the bottled output consisted of gin, 18,395,254 gallons; rum (bottled in continental United States and not including rum imported from Puerto Rico), 702,420; brandy, 3,259,678; cordials, liqueurs, and similar output, 5,686,248; vodka, 3,543,314; and miscellaneous, 459,623.

Withdrawals.—Tax-paid and tax-free withdrawals (in tax gallons) during the fiscal year 1955, compared with 1954, were as follows:

	July 1, 1954- June 30, 1955	July 1, 1953- June 30, 1954
Tax-paid withdrawals:		
Whiskey, bottled-in-bond ¹ ..	13,137,465	13,652,766
Whiskey, total.....	74,356,096	75,698,645
Brandy.....	3,241,475	3,075,152
Rum.....	276,542	299,247
Gin.....	15,947,003	12,778,285
Vodka.....	2,390,353	745,033
Spirits ²	47,107,330	50,970,570
Alcohol ³	9,803,516	15,223,740
Total.....	153,122,315	158,790,672
Tax-free withdrawals:		
For fortification of wine....	28,308,367	25,339,062
For denaturation.....	1,735,791	1,638,963
For export.....	1,736,556	3,474,005
Transfers to customs manufacturing bonded warehouses.....	803,379	3,073,553
For vessels and aircraft....	9,905	3,592
For use of the United States.....	468	1,687
To foreign trade zones.....	44,251	22,178
Total.....	32,638,717	33,553,040

¹ Included in total whiskey. ² Produced at registered distilleries. ³ Produced at industrial alcohol plants.

Apparent Consumption.—The apparent consumption of distilled spirits in the United States during the calendar year 1954, as compiled by the Distilled Spirits Institute, Inc., amounted to 189,470,688 wine gallons, a decrease of 2.7% compared with 1953. These figures are based on actual wholesale and retail sales in the monopoly states, and on tax collections or gallonage shipments to wholesalers in the license states. Consumption in the license states amounted to 136,955,928 gallons, or 72.3% of the total consumption, and 52,514,760 gallons in the monopoly states, 27.7% of the total.

The following table shows apparent consumption in the 10 leading states in 1954, compared

with 1953 (in wine gallons), and indicates the type of control:

	1954	1953
New York.....	24,107,193	23,934,753 (license)
California.....	19,704,314	19,707,741 (license)
Illinois.....	13,588,678	14,369,475 (license)
Ohio.....	10,929,657	11,237,176 (monopoly)
Pennsylvania.....	9,508,637	10,046,106 (monopoly)
New Jersey.....	8,535,992	8,443,335 (license)
Michigan.....	8,448,017	8,555,682 (monopoly)
Texas.....	7,184,359	7,164,164 (license)
Massachusetts.....	6,796,091	6,664,545 (license)
Florida.....	5,785,598	5,856,102 (license)

Per capita consumption of distilled spirits in the United States during 1954 was 1.18 wine gallons.

Stocks.—Stocks of whiskey and other distilled spirits remaining in internal-revenue bonded warehouses as of June 30, 1955, compared with June 30, 1954, at original entry gauge and before determination of losses owing to leakage, evaporation, and related factors, were as follows (in tax gallons):

	June 30, 1955	June 30, 1954
Whiskey.....	715,860,858	720,698,733
Brandy.....	12,520,443	14,215,932
Rum.....	1,056,378	1,189,224
Gin.....	1,759,529	1,505,214
Vodka.....	138,455	172,453
Spirits.....	110,160,340	126,546,591
Total.....	841,496,003	864,328,167

Revenues.—Revenues accruing to the federal government from distilled spirits during the calendar year 1954 amounted to \$1,911,433,000, a decrease of 3.85% compared with 1953, and accounted for 69.71% of federal collections from alcoholic beverages. Taxes from beer amounted to 27.17% of the total alcoholic beverage receipts of \$2,741,907,000, and wine accounted for 3.12%. The federal excise tax rate on distilled spirits was \$10.50 per proof gallon.

Imports.—United States dutiable imports for consumption of distilled spirits during the calendar year 1954 amounted to 22,127,106 tax gallons, with whiskey comprising 20,157,647 gallons of the total. In addition, 1,948,106 gallons of spirits were received from Puerto Rico and the Virgin Islands.

Exports.—Exports of distilled spirits from the United States to foreign destinations (exclusive of military shipments) amounted to 3,933,505 proof gallons. In addition, 580,763 gallons were shipped to Puerto Rico, the Virgin Islands, Alaska, and Guam.

Distillers' Dried Grains.—Production of distillers' dried grains at registered distilleries and industrial alcohol plants during 1954 consisted of 123,200 tons of dark grains, 65,300 tons of light grains, and 53,700 tons of dried solubles, or a total of 242,200 tons.

Canada.—Beverage distilled spirits produced in Canada during 1953 amounted to 17,925,007 imperial proof gallons, compared with 16,694,807 gallons in 1952. Net sales of potable spirits during 1953 amounted to 12,445,166 proof gallons valued at \$97,715,878. Imports of distilled spirits during that year amounted to 3,867,477 proof gallons, with exports amounting to 7,376,492 gallons.

HOWARD T. JONES,
Executive Secretary, Distilled Spirits Institute, Inc.

DISTRICT OF COLUMBIA. This federal district of the United States comprises an entirely urban area of 61 square miles, and is coextensive with the city of Washington, the national capital. Population: (1950) 802,178; (est., July 1, 1955) 831,000.

Government.—Administration is handled by a board of three commissioners, two of whom are civilians appointed by the president of the United States, with the consent of the Senate, and the third, a member selected from the Corps of Engineers of the U.S. Army. Commissioners in 1955 were: Samuel Spencer, president, Robert E. McLaughlin, and Brig. Gen. Thomas A. Lane. The secretary of the board was G. M. Thormett; finance officer, James L. Martin; corporation counsel, Vernon West; and superintendent of schools, Dr. Hobart M. Corning.

Legislative power is vested in the U.S. Congress, which generally seeks advice from the Board of Commissioners regarding proposed legislation. District residents do not vote in elections. A federal court of appeals and a federal district court serve the District.

Finances.—Treasury receipts (1954-55 fiscal year): \$179,153,977; approximate expenditures, \$171,313,360; treasury balance, \$12,221,037; long-term indebtedness, \$1,900,000.

Taxation.—District tax revenue (1954-55 fiscal year): \$103,172,096, including \$17,852,735 from a 1% food sales tax, a 3% tax on room accommodations furnished to transients, a 2% tax on all other retail sales, and selective sales and gross receipts taxes; \$2,634,849 from licensing; \$5,796,194 from individual income taxes; \$6,658,195 from corporate franchise taxes; and \$48,495,410 from property taxes. The District has no poll tax.

Banking.—As of June 30, 1955, the District's 8 national banks had \$920,343,000 in assets, \$694,661,000 in demand deposits, and \$163,063,000 in time deposits; 9 other banks and 22 branches had \$530,588,000 in assets, \$329,416,000 in demand deposits, and \$155,950,000 in time deposits.

Education.—School attendance is compulsory for all between the ages of 7 and 16, inclusive. Operating expenditures of \$28,860,556 (\$308.46

¹ Mentally ill District residents are hospitalized at St. Elizabeths Hospital, a federal institution. ² Daily average, 1954. ³ Maryland School for the Blind, Overlea, Md., maintains District blind children at District expense. ⁴ Columbia Institution for the Deaf, Washington, D.C., maintains District deaf children at District expense. ⁵ Includes 213 boys committed to the National Training School for Boys. ⁶ Average for 1954-55.

UNITED PRESS

Automobiles are permitted to park in center of Washington's Pennsylvania Avenue during July 1955 transit strike.

Social Welfare.—Public welfare expenditures from federal and District funds (excluding institutional costs) for the 1954-55 fiscal year totaled \$7,654,060, including \$2,086,949 for old-age assistance, \$3,243,610 for dependent children, \$189,186 for the needy blind, and \$1,671,311 for the disabled; a monthly average of 15,727 persons received public assistance. Operating expenditures for welfare institutions totaled \$3,670,817; for correctional and penal institutions, \$4,214,820.

Labor Force.—In the calendar year 1954, employers paid an estimated \$795,721,450 in wages, representing a .1% decrease from the 1953 figure, to an average of 217,265 workers covered by the District Unemployment Compensation Act. Average covered employment and wages paid were as follows: contract construction, 16,896 employees (\$69,578,653); finance, insurance, and real estate, 23,394 (\$73,957,856); manufacturing, 15,748 (\$71,718,583); service industries, 50,045 (\$176,089,280); transportation, communication, and other public utilities, 21,273 (\$91,277,786); wholesale and retail trade, 89,811 (\$312,784,149); and other, 98 (\$315,143).

Manufacturing.—In 1954, manufactures engaged 15,748 persons covered by the District Unemployment Compensation Act, to whom \$71,718,583 was paid in wages by 531 employers. The two major manufactures, printing and publishing and food processing, employed 9,467 and 3,793 covered workers, respectively. Value added by manufacture in the District totaled \$150,687,000 in 1953.

Transportation and Communications.—Expenditures for road and highway maintenance in the 1954-55 fiscal year totaled \$18,280,228, and newly completed construction and reconstruction aggregated 30.53 miles.

Highways and roads on April 1, 1955, totaled 1,200 miles, all of which were surfaced. Registered motor vehicles numbered 192,528 on Sept. 30, 1955, including 158,094 passenger cars. There were 6 railroads operating 34 track miles within the District (1955) and 10 regularly scheduled airlines and 1 public airport.

Communications media (1955) included 7 AM and 9 FM radio stations and 4 operating television outlets; 3 daily newspapers (circulation, 779,804) and 4 weekly newspapers (circulation, 802,178); and (Jan. 1, 1955) 253,454 business and 284,032 residential telephones.

Principal Events, 1955.—The 52-day transit strike, which had crippled the District's trans-

portation facilities since July 1, ended on August 22 after an act of Congress gave the District commissioners power to negotiate a wage settlement. The act, which also cancelled the Capital Transit Company's franchise after one year, authorized fare increases to provide revenue for the wage increase granted. Racial discrimination was eliminated as a factor in gaining employment on the company's cars and buses under an agreement announced January 13 by the president's Government Contract Committee.

Clark Calvin Griffith (q.v.), owner of the Washington Senators baseball team and co-founder of the American League, died in Washington on October 27. Clark R. Griffith was appointed president of the club to succeed his father.

Octagon House, which served as the executive mansion after the White House was destroyed by fire in 1814, was opened to the public on November 10, after extensive restoration.

DIVIDENDS. See PROFITS AND DIVIDENDS.

DIVORCE. See MARRIAGE AND DIVORCE.

DODECANESE ISLANDS. A group of 14 inhabited islands and some 40 islets and reefs in the southeastern Aegean Sea, forming a prefecture of Greece. Area, 1,035 square miles; pop. (1951), 121,074. Rhodes (537 sq. mi.) is the main island; and the city of Rhodes (24,186) is the capital. Chief crops are olives, grapes, tobacco, and oranges. Sponge fishing and sheep and goat raising are important. Handicrafts include pottery, leather goods, silk, copperwork, and carpets.

DOG SHOWS. See SPORTS, GAMES, AND SHOWS.

DOMINICA. See WINDWARD ISLANDS.

DOMINICAN REPUBLIC. A Caribbean republic comprising the eastern part of the island of Hispaniola. Area, 18,641 square miles; pop. (est. mid-1955), 2,404,000, mainly of mixed white and Negro descent. Chief cities and populations (Jan. 1, 1954): Ciudad Trujillo (the capital), 221,558; Santiago de los Caballeros, 61,406; and San Pedro de Macoris, 21,580.

Government.—The legislature consists of a Senate of 23 members and a Chamber of Deputies of 52. Senators and deputies are elected for 5-year terms. The president is also elected by popular vote for a 5-year term. Generalissimo Rafael Leonidas Trujillo Molina has dominated the government since 1930. His brother, Gen. Hector B. Trujillo Molina, was elected president in an unopposed election in 1952.

Education and Religion.—In 1953 there were 286 elementary and junior high schools (81,622 pupils); 1,221 emergency rural schools (68,303); and 916 rural grammar schools (98,873). Enrollment in high schools totaled 6,679; in trade schools, 8,814; and in special schools, 99,829. The University of Santo Domingo had 4,794 students. Roman Catholicism is the state religion. There is freedom of worship for other faiths.

Finance.—Revenue in 1955 was estimated at 108.1 million pesos; expenditure, 105.5 million. The Dominican peso is equal to the United States dollar. The public debt was retired in 1953.

Production.—The all-important sugar crop is grown mainly on estates in the south. Over 60,000 workers are employed in the country's 16 sugar centrals. Sugar production in 1954 (prelim.) totaled 772,000 short tons (raw value), as compared with 699,000 in 1953. Other major cash crops are: coffee, 460,000 bags (132.3 pounds each) in 1954-55 (prelim.); cacao, 84,024,000 pounds in 1954-55 (prelim.); and tobacco, 41.5 million pounds in 1954. Subsistence crops include corn, rice, sweet potatoes, dry beans, plantains, and peanuts.

In 1953 there were 3,529 industrial establishments employing 60,025 wage earners and hav-

ing a gross sales value of 154.9 million pesos. Chief manufactures are tobacco products, chocolate, textiles, beverages, peanut oil, furniture, cement, tiles, bricks, straw hats, soap, hides, shoes, and fertilizer. The republic exports some 120,000 tons of high-grade iron ore annually. Electricity output in 1953 totaled 167.5 million kw.-hr., a rise of 50.1% over that of 1952. Gross national product was 434.7 million pesos in 1953, a 5.1% increase over the 1952 figure.

Foreign Trade.—Exports in 1954 totaled 119.73 million pesos; imports, 82.83 million. Sugar exports were valued at 40.1 million pesos; cacao, chocolate, and cocoa products, 32.3 million; and coffee, 31.4 million. Imports are mainly machinery and vehicles, textiles, foodstuffs, iron and steel products, fuels, and lubricants. The United States took 56.6% of the republic's 1954 exports and provided 64.5% of imports.

Transportation and Communications.—The highway network in 1953 totaled 2,100 miles, including 1,450 of all-weather roads. Two government-owned railways aggregating 152 miles offer irregular service. Sugar firms have several hundred miles of private lines. International airlines and a domestic line provide regular air services. Passenger cars numbered 5,794 in 1955; trucks, 5,034; telephones, 8,900 (1955); radios, 100,000 (1952); television sets, 1,200 (March 1954). There were 5 daily newspapers in 1952 with a total circulation of 54,000.

Principal Events, 1955.—In preparation for the international fair scheduled to take place in Ciudad Trujillo from Dec. 20, 1955, to Feb. 27, 1956, an intensive construction program was under way, including the erection of six pavilions which are to remain as permanent government buildings. The 1955 public works program also included construction of bridges, highways, housing, port improvement, and irrigation. Construction by a mixed Dominican-American company of a giant shipyard and drydock development at Rio Haina near Ciudad Trujillo commenced in February. When completed in 1959 the facilities will be capable of servicing the world's largest ships.

Following the passage of legislation preparing the way for the nationalization of the electric and telephone industries, the government purchased the electric company in early 1955 and proceeded to negotiate for the purchase of the telephone company. The government's literacy drive was renewed with vigor in 1955, with attendance in literacy courses made mandatory for all illiterate persons between 14 and 60. Following passage on May 11 of a bill granting amnesty to political prisoners, President Trujillo offered government aid to voluntary exiles who desired to return.

DOWNES, (Edwin) Olin, American music critic: b. Evanston, Ill., Jan. 27, 1886; d. New York, N.Y., Aug. 22, 1955. As senior music critic for the *New York Times*, he possessed a profound knowledge of his subject and a unique gift for expressing its elusive qualities.

Taken to Boston, Mass., by his parents in his early youth, Olin Downes embarked on a career in music at the age of eight. Although his formal education ended with elementary school, he continued private study of piano, musicology, harmony, and music appreciation. In 1906, after a brief period of acting as vocal accompanist, teaching piano, and playing viola in a string

quartet, he was appointed music critic to the *Boston Post*. While in Boston he conducted music courses at Boston and Harvard universities. In 1924 he succeeded Richard Aldrich as music critic for the *New York Times*.

In addition to his outstanding reputation as a critic, Downes was a popular lecturer. He gave a series of lectures at the Brooklyn Academy of Music (1932-34), and participated in a joint lecture-recital series with Walter Gieseking, the famous pianist, at Town Hall in New York (1934). He also lectured at Chautauqua, N.Y., and at the Tanglewood music festivals in Massachusetts, and for a time was commentator for the Sunday afternoon broadcasts of the New York Philharmonic-Symphony Society. In 1938-39 he served as director of music for the New York World's Fair.

Always willing to listen objectively to the artistry of new composers and musicians, Downes early recognized the genius of Jean Sibelius, and was named commander of the Order of the White Rose of Finland for his championship of the Finnish composer. Besides numerous articles for periodicals, Downes also wrote *The Lure of Music* (1918) and *Symphonic Broadcasts* (1932, republished as *Symphonic Masterpieces* in 1935); and edited, with Elie Siegmeister, *A Treasury of American Song* (1940, 2d ed. 1943).

DUFF, Sir Lyman Poore, former chief justice of Canada: b. Meaford, Ont., Jan. 7, 1865; d. Ottawa, April 26, 1955.

Lyman Duff was educated at the University of Toronto (B.A. 1887) and the Osgoode Hall Law School (LL.B. 1889). Admitted to the bar of Ontario in 1893, he practiced briefly at Fergus before going to Victoria, B.C., where he became the law partner of Gordon Hunter, later chief justice of the province. After participating in a variety of important cases in which he demonstrated an extraordinary legal talent, he was named queen's counsel in 1899 and puisne justice of the Supreme Court of British Columbia in 1904.

In 1906, Sir Wilfrid Laurier, then prime minister, appointed him justice of the Supreme Court of Canada, a position he held until 1933, when he became chief justice following the resignation of Francis A. Anglin. The present law of Canada is to a great extent the product of his interpretations of the cases that confronted him. After his term was twice extended by the government beyond the normal retirement age of 75, he retired in 1944.

Justice Duff frequently acted as administrator of Canada in the absence of the governor general. In 1931 and again in 1940 it was his duty as representative of the king to open Parliament. The first occasion was the first time in the history of Canada that a Canadian opened the Canadian Parliament. He also served as head of a number of important royal commissions, including the commission investigating the Shell Contracts Committee (1916) and the Duff Commission on Transportation (1932). During World War I he nearly became prime minister when Conservative Party leader Sir Robert Borden, who was opposed by the Liberal Party, proposed that Justice Duff head the Union government of 1917. However, Sir Robert won control of the govern-

ment before a formal offer was made to the jurist.

Sir Lyman was the recipient of honorary degrees from a number of universities in Canada and the United States. In 1919 he was appointed to the Imperial Privy Council, the highest legal body in the British Commonwealth, and in 1934 he was created a Knight of the Grand Cross of St. Michael and St. George.

DULLES, John Foster, U.S. secretary of state: b. Washington, D.C., Feb. 25, 1888. Committed to the principle of negotiating from a position of strength, he labored throughout 1955 to achieve the reunification of Germany and to strengthen the West's far-flung system of defensive alliances.

Prior to his becoming secretary of state on Jan. 21, 1953, Dulles had served as a delegate to the San Francisco Conference (1945) and to the United Nations (1946-50), and as interim U.S. senator from New York (1949). From 1950 to 1953 he was Republican adviser to the Department of State, and in 1952 he wrote the foreign policy plank of the Republican Party platform.

Early in 1955, Dulles took a strong line against Communist China's threatened invasion of Formosa. After attending the first meeting of the Council of the Southeast Asia Treaty Organization (q.v.) in Bangkok (February 23-25), he visited Chiang Kai-shek in Formosa, where on March 3 he signed documents activating the United States-Nationalist China mutual aid treaty negotiated in December 1954. In a major foreign policy speech to the people of the United States on March 8, he warned Communist China against underestimating American willingness to meet a military challenge in the Far East. He repeated his contention, despite British opposition, that although the United States was not committed to the defense of the islands of Quemoy and Matsu, it would fight for them if their invasion constituted a threat to Formosa and the Pescadores.

At the Asian-African Conference (q.v.) in Bandung, Chou En-lai, premier of Communist China, proposed that his country and the United States hold discussions on the Formosa question. Dulles eventually announced that the United States was prepared to enter talks with Communist China without requiring the presence of Nationalist China, provided discussions were strictly confined to a cease-fire in the Formosa Strait.

Secretary Dulles subsequently hailed French ratification of the Paris agreements, which granted sovereignty to West Germany and provided for its admission to the North Atlantic Treaty Organization, and the signing on May 15 of the Austrian State Treaty.

On June 20-26, Dulles attended the tenth anniversary meeting of the United Nations in San Francisco, where final arrangements for the "Summit Conference" at Geneva were made. Following the Geneva Conference (q.v.), which resulted in some relaxation of tension between the East and West, Dulles went to the Geneva meeting of foreign ministers (October 27-November 16), where an unsuccessful attempt was made to implement the Big Four's directives on German reunification and European security, disarmament, and East-West contacts. During the period of negotiation, Dulles paid official visits to General Franco in Spain (November 1) and Marshal Tito in Yugoslavia (November 6).

Secretary Dulles' Middle Eastern policy was committed to winning over the Arab states on

one hand and at the same time remaining sympathetic toward Israel's Western orientation. On August 26 he offered a three-point program to further stability and progress in that area.

Du VIGNEAUD, Vincent, American biochemist: b. Chicago, Ill., May 18, 1901. He was awarded the 1955 Nobel Prize in chemistry on November 2 for his work on the synthesis of the hormone, oxytocin, and for his work toward the synthesis of another hormone, vasopressin.

After being graduated from the University of Illinois in 1923, he pursued graduate studies at Illinois and the University of Rochester School of Medicine (Ph.D., 1927). He did further work at the Johns Hopkins University Medical School, the Kaiser Wilhelm Institute in Dresden, and the University of Edinburgh Medical School before he returned to join the faculty at Illinois in 1929. From the George Washington University School of Medicine, where he became the head of the

biochemistry department from 1932 to 1938, he went to the Cornell University Medical College in 1938.

Du Vigneaud has attained scientific eminence for his work in taking apart and then synthesizing—recreating under artificial conditions—the oxytocin hormone secreted by the pituitary gland, a hormone which is of importance in childbirth and lactation. His work and that of his associates, described by the Nobel authorities as “a historic feat in biochemistry,” produced in October 1953 the first synthesis or test-tube production of oxytocin. Composed of eight of the different amino acids, the material was the most complex of its kind ever made by man. He has also worked on the synthesis of vasopressin, a hormone which keeps a check on organs such as the kidney and regulates blood pressure.

In 1946, du Vigneaud and his associates had also accomplished the long-attempted synthesis of penicillin G. As a result, the industrial production of penicillin, until then restricted to the laborious mold process, was made much easier.

On Dec. 8, 1955, it was announced that du Vigneaud was scheduled to receive the 1956 Willard Gibbs Medal of the American Chemical Society on May 18, 1956.

ECUADOR. A member of the United Nations and the Organization of American States, Ecuador is situated on the west coast of South America between Colombia and Peru, is approximately 100,000 square miles in area (including the Galápagos Islands (3,123 square miles), and has a population of 3,567,000 (United Nations est., July 1954). Census figures for 1950 show that about 58% of the population lives in the sierra (the central plateau region), and about 40% in the coastal area, although population patterns indicate a steady migration from the sierra to the coast, where work and land are more plentiful. Only 47,000 people live in the Oriente, the large lowland forest area east of the Andes which comprises about one half of Ecuador. Less than 10% of the population of this primarily Indian and mestizo country is white.

According to 1955 official estimates, Guayaquil, the largest city and major port and commercial center, has a population of 360,000; and Quito, the capital, 220,000.

Government.—Under the 1946 constitution, the president (José María Velasco Ibarra, who took office on Sept. 1, 1952) is elected directly for a 4-year term and may not succeed himself. Congress consists of a 45-member Senate (4-year terms), 33 of whom are elected on a popular basis by province and 12 of whom are

chosen by cultural and economic associations; and a 69-member Chamber of Deputies (2-year terms), generally 1 for each 50,000 inhabitants. The next general election is scheduled for June 1956. The traditional political parties of Ecuador include the Conservative (Catholic), the Liberal (divided into “Authentic” and “Independent”), the Socialist, and the Communist. New groups emerging are the Concentration of Democratic Forces (led by the exiled Dr. Carlos Guevara Moreno), which was victorious in the municipal elections of Nov. 7, 1955; “Velasquista committees” (personal followers of the president); and the Ecuadorian Revolutionary Action, or ARNE (a Falange-type group). On the whole, politics is a regional, economic struggle between the landed, protectionist interests in the sierra and the export-importing interests of the coast.

Education and Religion.—Primary education is free and compulsory in Ecuador. In 1952 there were 3,706 primary schools, with 7,487 teachers and 352,396 pupils; 182 secondary schools, with 1,031 teachers and 32,390 pupils; and 6 universities, with 411 teachers and 4,562 students. Although a campaign against illiteracy was begun in 1944, a 1953 government report stated that 50% of the population was illiterate. The constitution of Ecuador guarantees freedom of religion to all persons. Nevertheless, the Roman Catholic Church, led by Ecuador's first cardinal, Carlos María de la Torre, exercises considerable influence in all phases of the country's life.

Finances.—In 1954 the national budget was estimated at \$42,470,000 (converted at the official rate of 15 sucres to the U.S. dollar). National revenues during that year reached a record high of \$64,358,000, compared with \$54,077,933 in 1953; actual expenditures amounted to \$76,499,000, compared with \$61,287,400 in 1953. The internal debt was reported at \$17,908,866 in 1954; the foreign debt, \$51,911,264.

Agriculture and Industry.—Ecuador's economy is predominantly agricultural. Although most of the land is still uncultivated, a continuous development policy has greatly increased production in recent years. The principal export crops are bananas, the production of which totaled 870,000 tons in 1954, an increase of 37% over 1953; cacao (37,000 tons, an increase of 44%); coffee (28,000 tons, an increase of 25%); and rice (51,200 tons, a decrease of 45%). Domestic

products include maize (corn), the production of which totaled 129,000 tons in 1954, an increase of 35% over 1953; barley (92,000 tons, an increase of 14%); sugar (55,900 tons); and wheat (32,300 tons, an increase of 14%). The cultivation of cotton and tobacco is also being encouraged and expanded. In 1955 the railroad running from Quito to the northern port of San Lorenzo and linking the Andes with the Pacific Ocean was near completion; freight traffic was scheduled to begin by early 1956.

Industrial developments during 1955 included continued construction on the 14,000-kw. hydroelectric plant at Quito, which is scheduled for completion in 1958, and on a second cement plant near Riobamba to supplement the one at Guayaquil; and completion of the Quito water-supply project begun in 1947. The shortage of low-cost power remains a serious problem.

Labor organization is limited to workers in the major centers. The Confederación de Trabajadores del Ecuador (CTE), claiming some 60,000 members in 125 unions, has been affiliated with the Communist-dominated CTAL of Mexico. The relatively new Catholic Workers Confederation (CEDOC) has fewer than 10,000 members.

Foreign Trade.—Ecuador's trade program continues to expand. Exports for 1954 totaled \$100,220,000, as compared with \$75,680,000 in 1953; and imports, \$86,045,000 (\$63,400,000 in 1953). Principal export crops in 1954 were cacao (\$34,923,200), bananas (\$28,009,500), and coffee (\$27,086,200); other exports included rice, balsa, quinine-base drugs, Panama hats, minerals, and petroleum. Exports to the United States comprised 62% of the total, and imports from the United States, 55%. Ecuador is the world's leading exporter of bananas.

Transportation and Communication.—The Ecuadorian highway construction and improvement program, the purpose of which is to create a system of all-weather roads which will open up new and isolated areas, was further augmented in 1955. A total of 1,336 miles of roads (estimated to cost 844 million sucres, or over \$56 million) have been projected by the government. The program will be financed by increased taxes on gasoline sales, credit extended by the Export-Import Bank of Washington and the International Bank for Reconstruction and Development, and appropriations in the national budget. In addition, a major road-building project in Guayas Province at a cost of approximately \$25 million has been undertaken by the Guaya Highway Commission. In 1954 there were only 3,407 miles of all-weather roads in Ecuador. The Pan American Highway, running the length of the sierra, lacks an 87-mile section from Loja to Macará before connecting with Peru.

Approximately 718 miles of railway track serve Ecuador's 9 railways. It was expected that the important Quito-San Lorenzo extension of the Quito-Guayaquil line would be open to traffic in 1956. The international air routes of Panagra, Braniff, Avianca, Royal Dutch Airlines (KLM), and Transportes Aereos Nacionales (TAN) link Ecuador with the rest of the world. The airports at Quito and Guayaquil are scheduled for modernization.

Principal Events, 1955.—Before the Council of the Organization of American States (OAS) on Sept. 8, 1955, Ecuador formally charged Peru with massing naval elements along the coast, and 20,000-30,000 troops in the vicinity of El Oro and Loja provinces (Ecuador) on the disputed frontier. The United States, Argentina, Brazil,

and Chile, as guarantors of the 1942 Ecuador-Peru border treaty, sent a team to investigate the charge. The initial report of the inspection group (September 14), based on aerial reconnaissance, failed to verify any troop concentrations in the area. Ecuador subsequently withdrew her charges, crediting the swift action of the OAS with the prevention of Peruvian military action.

Reaffirming earlier declarations of sovereignty over a 200-mile belt of waters along their coasts, Chile, Peru, and Ecuador met in Quito, December 12-16, and established quota and licensing regulations for fishing in the area, despite refusal by the United States and other countries to recognize the validity of such action under international law.

ROBERT D. HAYTON,
Department of Political Science,
Hunter College.

EDEN, SIR (Robert) Anthony, British prime minister: b. Windlestone Hall, Durham County, England, June 12, 1897. On April 6, 1955, one day following the retirement of Winston Churchill, he was appointed prime minister of the United Kingdom by Queen Elizabeth II. He was unanimously elected leader of the Conservative Party on April 21, and retained his prime ministership through the Conservative Party's victory (344 seats to 277 for Labour) in the general elections held at his request on May 26.

A member of Parliament since 1923 and a ranking government figure since the 1930's, Eden had in recent years served as foreign secretary (1935-38 and 1940-45), leader of the House of Commons (1942-45), leader of the British delegation to the San Francisco Conference (1945), deputy leader of the opposition party (1945-51), and foreign secretary and deputy prime minister (1951-55).

Throughout 1955, Eden's activities were related to the West's determined but fruitless effort to reunify Germany in the face of Soviet opposition, and to strengthen existing ties with friendly Middle Eastern and Asian countries.

Prior to his appointment as prime minister, he attended the first meeting of the Southeast Asia Treaty Organization (q.v.) Council at Bangkok (February 23-25), and at the height of the Formosa crisis, Eden had proposed (March 8) a compromise whereby the Nationalist Chinese would abandon Quemoy and Matsu to the Chinese Communists for guarantees against attacks on Formosa and the Pescadores. On March 30 he announced the United Kingdom's adherence to the Baghdad Pact (q.v.).

After his appointment as prime minister, Eden attended the Geneva Conference (q.v.), where he offered three proposals to guarantee the Soviet Union's security in return for the reunification of Germany according to the plan he had submitted at the Berlin Conference in 1954. These included a security pact comprising the Big Four and a united Germany, demilitarization of a zone between the East and West, and delimitation of arms on each side in Germany and the countries neighboring Germany. During the conference of foreign ministers in October-November, the Soviet Union incorporated the latter proposal in its own security pact plan, but because the Soviet plan implied an indefinite division of Germany, it was disclaimed by the West.

Responding to the delicate Middle Eastern situation, Eden, on November 9, offered to mediate the Arab-Israeli dispute, but the offer was

rejected. On December 20 he announced important changes in his cabinet (see GREAT BRITAIN).

EDUCATION. School Segregation.—On May 31, 1955, the U.S. Supreme Court, in another historic decision, gave the job of ending racial segregation in public schools to lower federal courts and local school authorities. The court set no deadline for the beginning and ending of the transition, but made it clear that public disagreement would

WIDE WORLD

Negro and white students study together in Hoxie, Ark., school, following Supreme Court desegregation ruling.

not be permitted to stand in the way of the effective application of the principle that racial segregation in public education is unconstitutional.

In its unanimous opinion the court stated that local federal judges could take into account local conditions in determining whether school authorities were trying to end segregation as soon as practicable and in good faith. Desegregation was ordered to proceed "with all deliberate speed," a phrase which will probably be referred to frequently in the litigation that appears inevitable at the local level.

The ruling came slightly over a year after the court's original school segregation decision of May 17, 1954. The court had requested arguments by attorneys for both sides on how and when segregation should be ended. Lawyers for the National Association for the Advancement of Colored People (NAACP) had argued for the end of segregation by September 1956 at the latest; and attorneys for 10 states (Arkansas, Delaware, Florida, Kansas, Maryland, North Carolina, Oklahoma, South Carolina, Texas, and Virginia) and the District of Columbia had argued for no time limit and for authorization for federal district judges to weigh local problems in requiring adjustment to the decrees.

In a sense, the decision was a compromise in that no deadline was set. However, it was made clear that desegregation must proceed in "good faith." As one newspaper headline expressed it, "Court Upholds Principle, Gives Time."

The repercussions of the decision have been far reaching, especially in the Southern states

where the segregation issue had citizens aroused to fever pitch.¹ Some regarded the ruling as moderate and workable, even though it might produce years of litigation. However, in many Southern states the attitude was openly defiant. South Carolina reported "no slackening in its determination to maintain segregated schools to the maximum extent possible." In Georgia, Gov. Martin Griffin was quoted by the *Southern School News*, an objective reporting service on the progress of segregation, as declaring: "No matter how much the Supreme Court seeks to sugarcoat its bitter pill of tyranny, the people of Georgia and the South will not swallow it."

As schools opened in the fall of 1955, the situation regarding segregation was spotty. The *Southern School News* reported intensified opposition in seven states—Alabama, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, and Virginia. All of these states except Virginia opened the school year 1955–56 with a constitutional provision or statutory requirement permitting abolition of the public school system or assignment of pupils if desegregation should be enforced. In Virginia, six counties, including Prince Edward where one of the suits in the Supreme Court ruling originated, arranged their finances so that public support could be dropped immediately if courts ordered desegregation.

Progress in desegregation has been hailed rather optimistically by the NAACP. In a report issued May 14, the association's survey stated that nearly 250,000 Negro and white children were attending classes together in 500 public elementary and secondary schools that until 1954 had been segregated. "Admittedly," the report continues, "this is only a tiny minority of the 9,821,000 white and 2,397,000 Negro children enrolled in schools in the segregated areas."

West Virginia and Missouri, both border states, have done the "most effective job" of desegregation, according to the NAACP. In the 44 West Virginia counties in which Negro children of school age live, 29 have initiated desegregation, including 12 that have effected complete integration. In Missouri, 110 of the 177 school districts reporting Negro children have opened previously white schools to colored children.

St. Louis, Baltimore, and Washington have complied with the Supreme Court ruling and desegregated their schools. Some steps have been taken in communities in Texas, Oklahoma, and Kentucky. Arkansas has integrated in four of the state's 228 school districts in which children of both races live.

Petitions from Negro parents, usually backed by local branches of the NAACP, are "popping up all over the South," according to the September issue of *Southern School News*, which counted 118 petitions in 13 states at press time. Pressures of various kinds are being applied by anti-integration groups, whose activity has increased. By late 1955 there were 15 such organizations in the Southern states, including the States Rights League (South Carolina), the Federation for Constitutional Government (Tennessee), White America, Incorporated (Arkansas), and the Defenders of State Sovereignty and Individual Liberties (Virginia).

Educational TV.—With new stations going on the air in Chicago, Detroit, Miami, and Colum-

¹ Mandatory segregation laws were in effect in Alabama, Arkansas, Delaware, Florida, Mississippi, Missouri, North Carolina, Oklahoma, Georgia, Kentucky, Louisiana, Maryland, South Carolina, Tennessee, Texas, Virginia, and West Virginia. Permissive statutes were in effect in Arizona, Kansas, New Mexico, and Wyoming.

bus, the number of educational television stations in operation in the United States totaled 15 (out of 34 authorized) as of Sept. 30, 1955. Programs range from nursery school activities designed for viewing by preschool children to sociological studies of slum conditions, housing, etc. One station is conducting a series of programs on the religions of mankind; others have sequences on Shakespeare, atomic science, appreciation of art, and foreign languages.

Most of the stations offer college credit for some programs through the cooperation of local educational institutions. Station WQED in Pittsburgh operates an Adult High School of the Air. Courses can be taken for full credit toward a high school diploma, with final examinations administered by the Commonwealth of Pennsylvania and the Pittsburgh Board of Education.

The cost of educational television presents a serious problem. In San Francisco, for example, Station KQED, in operation a little over a year, broadcast an appeal for \$65,000 to continue on the air. Only three of the 15 stations in operation sold time for advertising. During the past two years national and local foundations have contributed over \$9 million for equipment and construction costs. The Fund for Adult Education (Ford Foundation) has been the chief backer of educational TV, with contributions of over \$5 million. Other millions have been contributed by universities, public school systems, and interested citizens.

Thirty-five colleges and universities now offer credit courses by television. The enrollment procedures are similar to those for other extension courses, with a limitation on the number of credits that can be earned. Many institutions provide a noncredit registration. For a small fee the enrollee receives a syllabus or supplementary reading lists. Noncredit enrollments far outnumber the credit students.

ELEMENTARY AND SECONDARY EDUCATION

U.S. School Enrollments.²—For the eleventh consecutive year, the total school enrollment in the United States increased. Public and private schools and colleges enrolled an estimated 39,557,000 students for the 1955-56 school year, an increase of 1,657,000 over the previous session, according to data compiled by the U.S. Office of Education.

As expected, the greatest increase occurred in the elementary schools. The total of 29,038,000 enrolled in 1955-56 represented an increase of 1,300,000 (4.7%) over the 27,738,000 reported for 1954-55. Approximately 12.6% (3,664,800) of the elementary pupils are enrolled in private and parochial schools.

The increased birth rate of the 1940's is having an increasingly greater effect on high school enrollments. The 1955-56 estimated enrollment in secondary schools totaled 7,680,000, an increase of 258,000 as compared with the 7,422,000 enrolled the previous session.

Approximately 10.5% of the high school pupils are in private and parochial schools, the enrollment of which increased from 774,800 in 1954-55 to 805,100 in 1955-56.

The peak in school enrollments is yet to be reached. By 1960 the public elementary and secondary school enrollment is expected to reach 37,363,000, an increase of 12,293,000 pupils in one decade, as compared with the 25,070,000 enrolled in 1949-50. Even a more rapid rate of

² For Canadian enrollment data, see the article CANADA.

ON YOUR NEXT TRIP
TRY TO PICK UP A
FEW NEW SCHOOLS!

JUSTUS IN THE MINNEAPOLIS STAR

—AND SOME MORE TEACHERS"

increase will occur between 1955 and 1965 when the full force of the increased birth rate now being felt in the elementary schools will strike the secondary schools and colleges.

In the next ten years it is anticipated that the total elementary school enrollment will increase by 7,921,000, or 28.6%, and the secondary school enrollment by 4,468,000, or 60.2%. By 1965 the U.S. Office of Education estimates that there will be 35,659,000 pupils in elementary schools and 11,890,000 in high schools.

Shortage of Teachers.—As school enrollments increase, the shortage of teachers continues to grow more acute. In 1954-55 there were 1,065,803 elementary and secondary teachers in the public schools of the United States, plus an estimated 136,000 in private and parochial schools, or a total of 1,201,800 teachers employed.

Of this number, 91,200, representing 8.6% of all teachers, held emergency certificates. Almost five sixths of the emergency teachers were concentrated in the elementary schools. In addition, there were many thousands of teachers who met only minimum standards of preparation.

Approximately 7.5% of the teachers leave the profession each year for various reasons (retirement, marriage, nonteaching positions, death, etc.). This means that 83,300 qualified teachers had to be replaced at the end of the 1954-55 session.

The 1955 *Teacher Supply and Demand Report* of the National Education Association states that 86,696 men and women graduated from United States colleges and universities in 1955 with standard preparation for teaching. Of this group, 35,278 completed four years of college preparation for teaching in elementary schools, and 51,418 for teaching in high schools.

On the basis of previous studies, however, it is estimated that only 79%, or 27,800, of the potential elementary teachers will actually accept teaching positions; in the high school field, only 56%, or 29,000 of the newly qualified teachers, will actually go into classroom service.

These 56,800 teachers are not enough even to care for the necessary replacements as indi-

"Schoolroom Progress U.S.A.," a two-car train exhibit depicting more than a century of progress in American educational facilities, is sponsored by THE ENCYCLOPEDIA AMERICANA and the Henry Ford Museum and Greenfield Village of Dearborn, Mich. The "Little Red Schoolhouse" car, shown above, contains authentic models of 19th century classrooms, with items from the Henry Ford Museum and Greenfield Village, including a log cabin school of 1810.

cated above. When the supply is increased by an estimated 25,000 emergency teachers who will enter the profession, there is still no provision for meeting the increased enrollment in 1955-56, which should have the services of 55,200 additional teachers.

To replace the emergency teachers employed in 1954-55 and to provide adequately for the increased enrollment in 1955-56 would require the services of 141,300 additional teachers. This shortage is being met by the employment of additional emergency teachers, by the re-entrance of former teachers into the profession, and by further overcrowding.

Nearly one million elementary school pupils are on half-day sessions because of the shortage of teachers or classrooms. This practice is most widespread at the lower grade levels, among the young children least prepared to learn effectively through individual, undirected effort.

A number of states offer scholarships to encourage college students to prepare for teaching, particularly in the elementary grades. In some cases the aid is in the form of loans which are cancelled at a given rate as the recipient teaches in the public schools of the state.

Recently many liberal arts colleges and state universities have added elementary education curriculums. Others have inaugurated "dual" programs to prepare for both elementary and high school teaching. Still others have introduced special summer programs to enable liberal arts graduates to qualify for elementary teaching.

School Building Needs.—The school building shortage has been mounting over a period of years. Back in 1930 it was estimated that 120,000 classrooms were needed to replace obsolete and overcrowded facilities. Little construction took place during the war years.

The School Facilities Survey of December 1953 reported a total of 245,417 classrooms currently needed: (1) to replace obsolete buildings, 126,680; (2) to house enrollment increases, 45,316; and (3) to relieve overcrowding, 73,421. This report was based on data received from 43 of the states. The estimated cost of these classrooms and related facilities was \$7,408,267,989.

Needed and projected school construction for the five-year period from September 1954 to September 1959, as reported by the various states, totaled 476,000 classrooms.³ Even this goal is not being reached at the current rate of construction. During 1954-55 some 60,000 new classrooms were built. Approximately 104,000

classrooms a year would have to be constructed during the remaining four years for the five-year goal to be achieved.

Many obstacles stand in the way. In various school divisions it will be necessary to float bond issues, raise debt limits, raise assessments, or provide state or federal aid to achieve the classroom goal by 1960.⁴

Total school construction, however, has expanded greatly. According to statistics compiled by the Commerce and Labor departments, over \$2.6 billion was spent on it in 1954, as compared with about \$100 million in 1945. The accelerated rate is continuing, and it is estimated that school construction in 1955 will approach \$3.25 billion.

Public Law 24, enacted by Congress in April 1955, provided \$70 million for needed classrooms in school districts adjacent to federal installations or defense projects, along with an additional \$20 million for current operating expenses of schools in those areas through the fiscal year 1955.⁵ Including funds requested for the fiscal year 1956, total financial assistance furnished by the federal government to schools in federally affected areas will amount to \$609 million for school construction and \$353 million for maintenance and operation.

White House Conference on Education.—The White House Conference on Education was held in Washington, D.C., Nov. 28—Dec. 1, 1955. Broadly conceived, the general purpose of the conference was to involve citizens and educators in a study of current educational problems.

During 1955, preliminary state and regional conferences were held, financed by an appropriation of \$900,000 provided by the 83d Congress. At these meetings educators and lay citizens identified and discussed educational problems in their areas. President Eisenhower, honorary chairman of the committee, appealed for "the most thorough, widespread, and concerted study that the American people have ever made of their educational problems." A national committee of 33 members, headed by Neil H. McElroy, president of Procter and Gamble Company, and made up of representative leaders in business, agriculture, industry, labor, education, publishing, and

⁴ Over 30 measures providing federal aid for school construction were introduced during the first session of the 84th Congress. One provided \$500 million a year for two years for grants-in-aid to the states. Another provided 50-50 matching grants over a six-year period. Still another provided a five-year program for the purchase of construction bonds, for school construction loans, and for direct grants-in-aid. None of these bills was enacted.

⁵ The program of federal financial assistance to schools in federally affected areas was originally authorized by Congress in 1950 under Public Laws 815 and 874. The Eighty-third Congress extended the program to June 30, 1956.

³ These figures are based on the school building plans of the various states. School housing officials regard it as a realistic goal of minimum needs and not necessarily an assurance that needs will be adequately met.

The "Schoolroom Progress U.S.A." educational exhibit was launched at Philadelphia on Sept. 21, 1955, and will visit hundreds of major cities during its three-to-five-year tour of the U.S. The modern classroom car, shown above, depicts five rooms, showing the most modern classroom architecture, equipment, and audio-visual devices, along with architect's drawings and photographs of outstanding examples of today's school buildings and classrooms.

other fields, was appointed by President Eisenhower and charged with the general responsibility for the program of the conference.

Six main topics were recommended for the local and state conferences, and these became the agenda for the national conference: (1) What should the schools accomplish? (2) In what ways can the schools be operated more efficiently and economically? (3) What are the school building needs? (4) How can enough good teachers be secured and kept on the job? (5) How can the schools be financed, built, and operated? (6) How can a continuing public interest in education be obtained?

Provision was made for the traveling expenses to Washington of 1,400 representatives from the various states and territories, allocated on the basis of population with no state having less than ten representatives. In addition, invitations were issued to 300 national organizations to send representatives. Congressmen, educational specialists, foreign observers, and special guests made up the balance of the 2,000 persons who participated in the conference.

Highlighting both the discussions and the final report of the conference was the strong stand taken for federal aid to education. By a ratio of over two to one, the conference delegates supported this solution to the financial problems facing the schools. In their discussions the delegates were overwhelmingly in favor of federal aid for school construction. About half even favored federal funds to aid the daily operation of schools.

A majority agreed that federal funds should be granted only on the basis of demonstrated need. There was almost unanimous opposition to any federal control over the use of allocated funds in local school districts. A large majority of the delegates opposed the use of tax funds for the support of private and parochial schools.

The need for some form of federal aid was expressed in a five-minute filmed message from President Eisenhower. This stand was reiterated in person by Vice President Nixon, the opening speaker. However, it was the address of Secretary of Health, Education, and Welfare Marion B. Folsom, the final speaker of the four-day conference, which convinced observers that the administration was now ready to move on this issue.

Secretary Folsom said that the bill which the administration will present to Congress will be drawn up on the basis of these general principles: (1) aid in building schools should not reduce the incentive for state and local effort; (2) assistance should be distributed according to need; and (3) freedom of local school systems should not be endangered. (New York Times, Dec. 4, 1955.)

HIGHER EDUCATION

College and University Enrollments.—The 1954 fall enrollments in institutions of higher education totaled 2,499,750, an increase of 249,049, or 11.1%, over the number enrolled in the fall of 1953. Women constituted approximately 36% of the total enrollment. In 1954 there were 1,601,984 men and 897,766 women. The proportion of men students is increasing slightly.

Comparative fall enrollment data for 1953 and 1954, by type of institution, as reported to the U.S. Office of Education, are shown in the accompanying table.

ENROLLMENT IN INSTITUTIONS OF HIGHER EDUCATION, 1953 AND 1954

Type of institution and number reported*	Fall enrollment		Gain (%)
	1953	1954	
Universities (141).....	1,080,950	1,166,459	7.9
Liberal arts colleges (723).....	578,835	637,449	10.1
Separately organized professional schools:			
Teachers colleges (193).....	185,945	216,032	16.2
Technological schools (48).....	74,458	80,228	7.7
Theological schools (114).....	27,385	28,760	5.0
Other (125).....	51,037	54,838	7.4
Junior colleges (513).....	252,091	315,984	25.3
All institutions (1,857).....	2,250,701	2,499,750	11.1

* Figures in parentheses represent number of institutions of each type reported in the fall of 1954.

It will be noted in the table that junior colleges, with an increase in enrollment of 25.3%, registered the greatest gain from 1953 to 1954. Separately organized teachers colleges gained 16.2% in enrollment, which is also considerably in excess of the average increase of 11.1% for all institutions. The increase in number of first-time students in both of these types of institutions also exceeded the national average.

By type of control, the publicly controlled institutions increased 15.9% in enrollment between 1953 and 1954, while the privately controlled increased 5.5%. In enrollment of first-time students, the increases were 14.2% and 9.9%, respectively.

The 1955 estimated fall enrollment for all institutions of higher learning was 2,591,000 (1,666,000 men and 925,000 women), an increase of 91,250, or 3.65%, over the number enrolled in the fall of 1954. The U.S. Office of Education estimated the number of first-time students in the fall of 1955 to be 637,000.

The enrollment of college-grade students is currently the largest in the history of the United States, exceeding even the peak reached during 1946-50 when over a million veterans were enrolled each year. Statisticians now predict a further rise in enrollments in the next few years

that threatens to engulf the country's colleges and universities.

Typical of the studies that have been made is *The Impending Tidal Wave of Students*, published by the American Association of Collegiate Registrars and Admissions Officers, which, on the basis of current birth rates and school enrollments, makes the following predictions:

(1) Approximately one third of our youth of college age now attend college. If there is no further increase in the percentage of college-age youth attending college, and the only increase is in the number of college-age youth in the population, there will be over 4 million in our colleges and universities by 1970.

(2) If the trend of increasing proportional attendance continues until 1962 at the rate of 1% a year—the pattern established over the last 20 years—there will be approximately 5½ million students enrolled by 1970 (40% of college-age youth attending).

(3) If the proportional attendance continues to increase by 1% a year until 1970, which is entirely possible, there will be 6½ million students enrolled (50% of college-age youth attending), which is more than two and one-half times the present enrollment.

Projected enrollments, according to the foregoing three bases of prediction (percentages of youth of college age enrolled), are as follows:

Year	(1) 31% enrolled	(2) 40% enrolled	(3) 50% enrolled
1955-56.....	2,505,206	2,747,645	2,747,645
1960-61.....	2,874,678	3,616,531	3,616,531
1965-66.....	3,617,874	4,667,979	5,134,778
1970-71.....	4,219,047	5,443,932	6,668,817

The rapid growth of higher education in the United States is difficult to realize. U.S. Office of Education statistics cited in the above-mentioned bulletin tell the story briefly. In 1900 there were 238,210 students in the country's colleges and universities; in 1910, 339,578; in 1920, 531,339; in 1930, 1,082,443; in 1940, 1,499,109; and in 1950, 2,439,910. The estimate of over 4,200,000 students by 1970 is a conservative one. Unless there is a change in our philosophy of higher education, a much larger number can be expected.⁶

Plight of the Colleges.—In 1954 the *Economic Report of the President* (transmitted to Congress on Jan. 28, 1954) estimated that United States colleges were already \$6 billion behind in their building programs. On Aug. 11, 1955, President Eisenhower signed Public Law 345 continuing and expanding the present college housing loan program to provide student facilities. Loans can now be made for service facilities, such as dining halls, cafeterias, and student unions. The loan fund was raised to \$500 million, of which \$100 million was made available for auxiliary facilities; the rate of interest is 2¾%.

Nearly half of the nation's colleges and universities are operating in the red, according to a survey made by the Council for Financial Aid to Education.⁷ Although tuition fees in the 753 reporting institutions have risen 26% since 1947-48, the average cost of operation has in-

⁶ As evidence of the impact of the higher birth-rate on potential college attendance, it should be noted that in 1953 there were 8,001,654 young people of college age in the United States. By 1960 this number will have risen 16% to 9,273,157; by 1965, 46% to 11,669,949; and by 1970, 70% to 13,609,831. In other words in the period 1954-70 there will be an actual increase of 5½ million in the number of young people of college age.

⁷ See "The Financial Status of Colleges and Universities in the United States," *Higher Education*, May 1, 1955.

creased 50%. Faculty salaries have risen an average of 88%, as compared with a 93.4% increase in the cost of living during this period. The 753 institutions participating in the CFAE survey reported a need of \$2.5 billion for buildings and equipment over the next 10 years, plus \$3 billion in additional endowment to meet mounting costs of operation, especially faculty salaries.

Grants for Faculty Salaries.—The Ford Foundation announced on March 6, 1955, the allocation of \$50 million to raise faculty salaries, and appointed a committee of educators and businessmen to advise on its distribution. Between 50 and 100 private, regionally accredited liberal arts institutions will receive grants ranging from \$100,000 to \$1 million, and will be expected to raise matching funds from other sources.

On December 12, the Ford Foundation allocated an additional \$210 million for the same purpose, the money to be divided among all 615 private, 4-year liberal arts and science colleges and universities in the United States. With \$90 million for private medical schools and \$200 million for voluntary hospitals allocated on the same date, the new grants total \$500 million, the largest amount ever given for philanthropic purposes at one time.

Aid from Corporations.—American business firms are giving millions to help American colleges. The *New York Times* ("The Corporation and the Campus," April 17, 1955) estimated that corporate giving in 1955 would total \$100 million, in addition to the \$50 million Ford Foundation grant for faculty salaries.

Among gifts announced in 1955 were \$1 million from U.S. Steel Corporation to over 400 colleges in 43 states, its second annual grant; \$150,000 from Standard Oil of Indiana to liberal arts colleges in the Midwest; and \$42,000 from International Harvester Company to 11 state associations of colleges. General Electric Company has offered to match dollar-for-dollar gifts up to \$1,000 a year which its employees make to the colleges from which they graduated (\$250,000 was expended under this program in 1955). The company spent an additional \$1 million on scholarships, fellowships, grants, and equipment assistance.

National Scholarship Fund.—In September 1955 the Ford Foundation, together with the Carnegie Corporation and several business firms, announced the formation of the National Merit Scholarship Corporation. With a \$20 million grant from Ford and \$500,000 from Carnegie, the project is the largest independent scholarship program ever established in the United States. The group will award \$1 million a year for 10 years in four-year scholarships. An additional \$8 million is available for matching contributions from business and industry, plus \$2.5 million for developing and operating the program.

Awards will be based on student needs and will range from an honorary \$100 grant to full tuition and living costs. The average four-year scholarship is estimated to cost about \$6,000. It is expected that approximately 350 grants will be made to high school seniors during the first year of the program.

Two other important grants have been announced: the Sears-Roebuck Foundation has made a grant of \$600,000 for 100 student awards the first year, and Time, Incorporated, has allotted \$30,000 for five scholarships. Other corporations are expected to join the movement.

In an article announcing the Ford grant, the *New York Times* (Sept. 11, 1955) comments on

the increase in the number and value of scholarships available to college students. In 1936 there were 72,505 scholarships and fellowships available at a value of \$11,440,000. By 1950 the number had increased to 156,923, with a total value of \$41,700,000. It is estimated that about 200,000 scholarships and fellowships, valued at more than \$50 million, are now available to college students.

Degrees Conferred.—The U.S. Office of Education reports that 358,699 earned degrees were conferred by higher educational institutions in 1953–54. By type of degree, the awards were distributed as follows: bachelor's and first professional, 292,880 (187,500 men and 105,380 women); master's and second professional, 56,823 (38,147 men and 18,676 women); doctor's, 8,996 (8,181 men and 815 women).

Over 10,000 degrees were conferred in each of five major fields: education, 74,846 (20.9% of all degrees); business and commerce, exclusive of accounting, 35,164 (10.1%); engineering, all fields, 27,127 (7.6%); English, 14,596 (4.1%); and history, 10,960 (3.1%).

The most popular fields for the various degrees, and the number awarded in each were as follows: Bachelor's and first professional—education, 47,383; business and commerce, 33,483; and engineering, 22,329. Master's and second professional—education, 26,075; engineering, 7,398; and business and commerce, 3,623. Doctor's—education, 1,388; chemistry, 1,013; and psychology, 619.

EGYPT. This Arabic-speaking country of northeastern Africa (area, 386,198 square miles) lies east of Libya and west of Palestine and the Red Sea. Almost 97% of Egypt is desert; only the Nile Valley, its delta, and a few oases in the Western Desert are cultivable.

Population.—Egypt's population was officially estimated at 23,240,000 on July 1, 1955. The capital city is Cairo (pop., 1953 est., 2,500,000), and Alexandria (1953 est., 1,000,000) is the chief port. Other leading cities, with 1953 population estimates, are Port Said (200,000), Tanta (180,000), and the textile "workers' city" of Mahalla el Kubra (180,000). The nomadic population (1953 est.) is close to 100,000.

Government.—During 1955, scheduled to be the last year of the transitional government of the Revolution, executive power remained in the hands of the Revolution Command Council established in 1952, though the membership of this purely military group was reduced from 11 to 9 officers. The Republic of Egypt, proclaimed in 1953, remained without a president after the fall of Gen. Mohammed Naguib on Nov. 14, 1954. A cabinet, partly civilian in composition, shared the duties of the presidency with the premier, Lieut. Col. Gamal Abd el-Nasser. The government was assisted in forwarding its ambitious reconstruction program by a National Production Council and a Permanent Council for Public Services; the former promoted the economic development of Egypt, and the latter coordinated the welfare activities of various ministries.

The Revolution Command Council renewed its pledge to establish parliamentary government early in 1956, and a new Egyptian Constitution, drafted by a 50-man committee, was promised (announced for Jan. 15, 1956). Government plans included representation for all classes in the proposed Parliament, the continued suppression of political parties, and the abolition of all religious (Moslem and non-Moslem) courts. As of January 1956, the civil courts are to be entrusted with the administration of Islamic law, as well as the religious laws of the various Christian and Jewish minority communities.

Finance.—The healthy state of Egypt's economy was reflected in the record budget estimates of July 1955.

Egypt's reserves of foreign currency (including gold, sterling, and dollars) rose to £E276 million¹ in April 1955 (£E265 million in 1953); the total ordinary accounts of the government in the National Bank of Egypt rose to £E38,250,000; the total value of treasury bills fell to £E54 million in May 1955 (£E99.5 million in February 1954); total deposits in banks rose to £E283.5 million in April 1955 (£E218.5 million at the end of 1952); and total deposits in savings banks, over the same period, rose from £E30 million to £E52.8 million. Meanwhile, the number of bank notes in circulation decreased to £E167.8 million.

According to government estimates of revenue and expenditure, Egypt's total budget for 1955–56 balanced at £E315,258,972 (£E303,003,333 for 1954–55). The new budget was divided into three separate, independently financed budgets. The ordinary budget balanced at £E238,300,000; a budget for the development of the national economy balanced at £E54,248,972; and a budget for the Permanent Council for Public Services balanced at £E22,710,000. The greatest increases in expenditure were allocated to health and education. The government found no need to impose new taxes or to raise existing ones.

Religion and Education.—More than 91% of Egyptians are Sunnite Moslems. The Coptic Christians (6.8%) have been well treated by the Revolutionary government, as have Egypt's small Eastern Christian, Roman Catholic, Protestant, and Oriental Jewish communities.

Primary schooling is free and compulsory, and secondary schooling is free. In 1954 there were 7,492 primary schools (1,438,465 pupils); 595 secondary schools (361,650 students); 85 industrial, commercial, and agricultural schools (27,129 students); and 80 teacher training schools (23,000 students). The Institute for Popular Culture, sponsoring a wide variety of adult education programs, enrolled 18,196 men and women in its 18 urban centers.

The University of Cairo (20,771 men and women students enrolled in 1954), the University of Alexandria (9,624 students), and the University of Heliopolis (16,039 students) are all government supported. The Moslem University of al-Azhar (founded in the 10th century) had 32,739 students in its colleges and affiliated institutes. The American University at Cairo had about 900 students.

Agriculture and Industry.—The Revolutionary government, after making a systematic survey of Egypt's economy, embarked on long-range development plans. It was recognized that the nation's most serious problems stemmed from the overpopulation of a relatively small cultivated area (about 6 million feddans in 1954; 1 feddan = 1.038 acres); that the population was growing at a rate of over 500,000 a year; and that agriculture (in which about 73% of the population was engaged) contributed about one third of the national income.

The government accordingly determined on the following economic development policies: (1) exploitation of all natural resources; (2) large-scale land reclamation, industrialization, and extended public services (to raise the general standard of living); and (3) increased production in all fields (to raise the national income). It promoted economic stability by avoiding inflation (seeking increased funds for development projects through internal and external loans), and created favorable conditions for private (foreign and domestic) investment in Egypt. By 1955, new private investment exceeded £E11.6 million (£E7.9 million in 1953).

Furthermore, the government sought to improve the balance-of-payments position through diversification of exports, continued restrictions on luxury imports and on imports of commodities produced domestically, and the encouragement of tourism and transit trade. In 1954 there was a balance-of-payments surplus of over £E3 million, as compared with a deficit of over £E8 million in 1953. A total of 300,000 tourists visited Egypt in the year 1954–55.

The kingpin of the government's public utility projects is the High Dam to be built on the Nile 4 miles south of the present Aswân Dam.

¹ At the official rate, the Egyptian pound (£E = U.S.\$2.872).

UNITED PRESS

(Left) Egyptian troops race toward police station, dynamited by Israelis during Gaza strip incidents in 1955. (Right) U.S. Assistant Secretary of State George V. Allen (l.) and U.S. Ambassador Henry Byroade (r.) greet Egyptian Premier Nasser, Oct 1, 1955, during efforts to persuade Egypt to cancel its arms deal with Czechoslovakia.

This dam, which is to have four times the capacity of Hoover Dam, is expected to provide 2 million more feddans of cultivable land and from 6 to 10 billion kw.-hr. of electric power for industry. With its ancillary works, it will cost about £E209 million and will take 10 years to build. When completed, it will presumably increase the national income by more than 20%. Foreign loans will be necessary to help construct the High Dam. Offers of aid from the USSR, disclosed in October 1955, were part of the Soviet penetration of the Middle East (see below, *Principal Events*, 1955). The Egyptian government, however, preferred to obtain a loan from the International Bank for Reconstruction and Development, with which negotiations were in progress, and assistance from the United States.

In rural areas the policies of the Revolution were actively advanced during 1955. Potable water was brought to many villages; by August, 140,000 feddans of confiscated land had been distributed to the peasants; more rural social centers for health and education were completed, bringing the total to 180 (161 in 1953); and silos for grain storage were constructed. Work in the new Liberation (al-Tahrir) Province (600,000 feddans in the western Nile Delta) was pushed energetically. This is one of two pilot demonstration projects undertaken partly with United States aid. The second one (80,000 feddans) is in Beheira and Faiyûm provinces. By mid-1955, 2,000 feddans had been reclaimed in the latter, and 10,000 feddans in Liberation Province.

The total cotton acreage was 1,579,427 feddans (1,324,304 feddans in 1953). Cotton production in 1954-55 totaled 7,746,358 kantars (1 kantar = 99.05 pounds). With a carry-over of 1,671,292 kantars (from September 1954), the season's cotton supply was 9,417,650 kantars. Other crops in 1954 included 8.2 million kantars of sugarcane, 12.3 million ardebs² of corn, 11.5 million ardebs of wheat, and 1,093,000 metric tons of rough rice.

In the industrial field the textile industries still ranked first in 1954-55. (A total of 64,340 metric tons of cotton yarn and 241,000 metric tons of woven cotton fabrics was produced in 1954.) Other well-established industries included

food processing, cigarette, chemical, and metal manufactures, leather and leather goods, cement, soap, matches, glass, paper, beer, vegetable oils, and cotton ginning and pressing.

Half a dozen foreign and two Egyptian oil companies continued to exploit or search for oil in 1955. They all operated under equal rights, and some new wells were discovered. Crude oil production amounted to 2,388,420 metric tons in 1954; 2,376,330 metric tons of oil were refined in Egypt, and domestic oil supplied 55% of Egypt's needs. Other minerals (with production figures for 1953-54) include phosphate (484,176 metric tons), manganese (278,806 metric tons), iron ore and oxides, salt, talc, soda, and gold.

Foreign Trade.—In 1954 the total value of exports was £E138.3 million (£E135.8 million in 1953); of imports, £E159.6 million (£E174.7 million in 1953). Egypt's trade in 1954 was carried on chiefly with the following countries:

	Exports (millions) £E18.2	Imports (millions) £E 3.9
India.....	15.8	15.4
France.....	14.3	20.0
United Kingdom.....	11.4	17.8
West Germany.....	10.4	12.0
Italy.....	6.8	0.9
Japan.....	6.4	27.7
United States.....		

Between Sept. 1, 1954, and Aug. 31, 1955, Egypt exported 5,500,113 kantars of cotton (7,223,425 kantars in 1953-54). On Sept. 27, 1955, the Alexandria Cotton Futures Market, which had been closed since November 1952, reopened with controls to ensure equilibrium with Liverpool.

Transportation and Communications.—Egypt has 1,782 miles of paved and 7,163 miles of unpaved roads (1951-52), 88,892 motor vehicles (Dec. 31, 1953), 135,388 telephones (1954), and 305,000 licensed radio receivers (1953). Expansion in all fields of communication, initiated in 1953-54, was continued in 1955. A direct telephone link was established with Syria via Amman, Jordan. The Egyptian State Railways, reorganized as an independent agency in 1954, operated over 3,938 miles of track. MISRAIR, an Egyptian subsidized airline, serviced the entire Middle East; and a civil aviation agreement was signed with Syria on July 3, 1955, providing for regular air services between the two countries.

² 1 ardeb of corn = 309 pounds; 1 ardeb of wheat = 331 pounds.

The Suez Canal Company, registered as an Egyptian firm with headquarters in Paris, holds a concession due to expire in 1968. Receipts from Suez Canal dues reached £E30.3 million in 1954 (£E28.9 million in 1953). A record 13,215 ships passed through the canal in 1954, carrying 102,493,851 net tons of freight.

Principal Events, 1955. Foreign Affairs.—Egyptian leaders made many significant foreign policy statements in the course of the year. In these they declared that they sought the closest possible unity with the Sudan; abjured war with Israel, but stated that Egyptian territory would be defended against aggression; and took a firm stand against defensive alliances with any non-Arab power.

At an Arab conference held in Cairo on January 22–February 6, Egypt, in cooperation with Syria and Saudi Arabia, led a strong protest movement against the pending Turkish–Iraqi pact (signed February 24). Later in the year, on October 20 and 27, Egypt signed mutual defense treaties with Syria and Saudi Arabia, respectively. At the Asian–African Conference (q.v.), held at Bandung, Indonesia, on April 18–24, Premier Nasser urged peaceful coexistence between the Communist bloc and the West, limitation of armaments, and collaboration with the United Nations. Nasser's work as a committee chairman at this conference won him much praise, and he helped to obtain the expressed support of all the Asian nations for the Arabs of Palestine and of French North Africa.

In the Sudan, Egypt faced a delicate situation in 1955. After the deposition of President Naguib in 1954, the cordiality of the Egyptian–Sudanese entente had cooled. The pressure politics of Maj. Salah Salem, Egyptian minister of national guidance and minister of state for Sudan affairs, now became increasingly distasteful to the Sudanese. A strong movement developed in the Sudan against political union with Egypt, and there was sharp disagreement over the allocation of the Nile flood waters. On August 29, Salem resigned, and Premier Nasser personally took over the direction of Egypt's Sudan policy. On October 29, it was announced that Egypt had accepted the principle of a plebiscite in the Sudan on its future political status.

Egyptian–Israeli relations constituted the worst problem of the year. The Gaza strip and El 'Auja demilitarized zone were frequently the scene of fighting. Despite appeals and warnings to both sides by the United States, Great Britain, and the United Nations, the situation continued to deteriorate. On March 29, the U.N. Security Council condemned Israel for an attack on the Gaza strip on February 28, and both sides were censured several times by the Egyptian–Israeli Mixed Armistice Commission. Early in June, Premier Nasser warned Israel that any attempt to occupy the Gaza strip would lead to war. Unremitting efforts by Maj. Gen. E. L. M. Burns, chief of staff of the U.N. Truce Supervision Organization in Palestine, led to triangular talks beginning June 28. Burns paid tribute to Egypt (in May) for giving "full cooperation" to the armistice commission in its efforts to maintain peace. But these were unsuccessful, and were ended on August 24. There was a recurrence of fighting soon thereafter, and again in late September. On October 2, both sides withdrew their troops from El 'Auja zone. A month later, on November 2, however, the heaviest fighting since the 1949 armistice occurred, with an Israeli attack on an Egyptian post in the zone.

(For further details of the Egyptian–Israeli conflict, see ISRAEL.)

The political issues leading to this explosive situation were of long standing. A state of war technically continued to exist after the armistice of 1949, and Egypt refused to consider negotiating a peace treaty until the United Nations resolutions of November 1947 were implemented in Palestine. When it came to the United Nations-sponsored talks on border security, Egypt would negotiate only under the auspices of the U.N. Truce Supervision Organization, lest direct negotiations imply recognition of Israel.

In the absence of a peace treaty, Egypt participated with the other Arab League countries in an economic boycott of Israel. To make sure that strategic materials were not being carried to Israel, on July 3, 1955, Egyptians even fired on and searched the British ship *Anshun* in the Gulf of Aqaba, which Egypt considers part of its territorial waters.

On September 27, Premier Nasser announced a barter agreement with Czechoslovakia, a "strictly commercial" exchange of heavy arms and planes for Egyptian cotton and rice. When the United States, disturbed by this extension of Soviet bloc influence into the Middle East, expressed its concern, the Egyptians explained their position thus: After the February attack in the Gaza strip, Egypt had turned first to the West for help, but the West had denied all appeals for heavy arms (except under the terms of a mutual security agreement, which Egypt refused to sign). Egypt then learned that France was sending jet planes and heavy arms to Israel. National security required that heavy arms be obtained, without strings attached, from any available source, and no reorientation of policy toward the West was implied. Egypt had been urgently in need of cotton markets, and the Czech accord is merely the latest in a series of economic agreements with the Soviet bloc.

Egypt had good relations with two of the three major Western powers in 1955. The British

"ADDITIONAL DANGER OF 'FOOTHOLDS'"

PLETCHER IN THE SIOUX CITY JOURNAL

evacuation of the Suez Canal Zone progressed smoothly and ahead of schedule. A revised sterling releases agreement was signed in Cairo on August 29, doubling the annual release (to £20 million) between 1956 and 1960. On February 23, the United States and Egypt signed four agreements allocating \$23,337,000 in United States aid for development projects and technical cooperation in public health programs. But relations with France deteriorated because of Egyptian support of nationalist movements in Tunisia, Algeria, and Morocco.

Internal Conditions.—On the home front the year 1955 opened with public trials of Moslem Brotherhood terrorists (15 were sentenced to death between Dec. 14, 1954, and Jan. 19, 1955), Zionist spies (2 were sentenced to hang on January 27), and Communists. Stern action was taken against narcotics smugglers and forgers, and tax evaders, and gambling was outlawed for all Egyptians. Press censorship was continued, but free discussion of the future form of government was allowed after May.

During the year, Egypt was host to Arab postal, medical, and scientific congresses and a regional meeting of the World Health Organization. More archaeological discoveries were made, and the great 32-foot statue of Rameses II was brought from Memphis and erected in Cairo.

CHRISTINA PHELPS HARRIS,

Stanford University.*

EINSTEIN, Albert, German-Swiss-American theoretical physicist; b. Ulm, Germany, March 14, 1879; d. Princeton, N.J., April 18, 1955. Devoting his life to the quest for the basic laws governing the universe, he originated the theory of relativity which, more than any previous concept, has broadened man's understanding of the cosmos. He also was the first to explain the photoelectric effect, which eventually made possible, among other technological advances, the development of talking motion pictures, television, and methods of electronic control. Einstein also explained the phenomenon known as the Brownian motion, thereby providing direct proof of the existence of the molecule and enabling experimental scientists to observe the effects of molecules in motion and to determine their number in any given unit of volume.

Born of unorthodox Jewish parents, Albert Einstein grew up in Munich, Germany, where his father operated an electrical supply works. In 1894, when the business failed, the family moved to Milan, Italy, but young Einstein remained to continue his schooling at the Luitpold Gymnasium. Unwilling to adjust to a philosophy of education that was alien to his inquisitive nature, he left Munich soon afterward to join his parents in Italy. Subsequently he studied at the cantonal school in Aarau, Switzerland, and at the Federal Institute of Technology in Zurich (1896-1900). In 1902 he was appointed examiner of patents in Bern, a position he held until 1909. During these years he became a citizen of Switzerland, obtained his Ph.D. degree at the University of Zurich, and published his first scientific papers, including *The Electrodynamics of Moving Bodies* (1905), his initial statement of the epoch-making "special" theory of relativity.

The young scientist's work impressed Max Planck, the German physicist who originated the quantum theory, and as a result he was appointed adjunct professor of theoretical physics at the University of Zurich in 1909. In 1911 he was

named to the chair of physics at the German University in Prague, and a year later, full professor of theoretical physics at the Federal Institute of Technology in Zurich. He became director of the Kaiser Wilhelm Institute for Physics in Berlin in 1914, after which he resumed his German citizenship.

In 1916 he published his "general" theory of relativity, which was effectively corroborated by photographic observations made during the eclipse of the sun in 1919 and subsequently; and in 1929 he published his first of many attempts to develop a unified field theory.

In 1932, while Einstein was visiting professor at the California Institute of Technology, he was invited to join the staff of the then-planned Institute for Advanced Study at Princeton, N.J. Although he returned to Europe in 1932 and early 1933 for brief visits to England and Belgium, the advent of the Nazi regime in Germany forced him to abandon his homeland, and in 1933 he arrived at the Institute for Advanced Study as professor of mathematics and theoretical physics, devoting full time to his research. His property in Germany was confiscated by the Nazis in the following year, and his German citizenship was taken from him. In 1940 he became a citizen of the United States. Although he retired in April 1945, he continued his research into the twilight of his life, hoping to discover the one all-embracing law of the cosmos.

Dr. Einstein died of a ruptured aorta at the age of 76 at the Princeton Hospital. His body was cremated, but at the request of his elder son, Hans Albert, his brain was removed for scientific study at the hospital. He had been married twice: in 1901, to a Serbian fellow student, Mileva Maréc, by whom he had two children, Hans Albert and Eduard, and from whom he was divorced in 1916; and in 1917, to Elsa Einstein, a cousin, who died in 1936.

Professor Einstein's life at Princeton was a deliberately cloistered one. Nevertheless he spoke out on political and moral issues that were of concern to him. On Aug. 2, 1939, inspired by fellow scientists, he wrote his now-famous letter to President Franklin D. Roosevelt warning him of the reported large-scale nature of German research in nuclear fission and urging "quick action" by the administration in investigating the possible application of nuclear research to military weapons. This led eventually to the vast Manhattan Project that culminated in the production of the atomic bomb. After the devastating atomic bombings of Hiroshima and Nagasaki, Japan, in August 1945, he devoted much of his time and energy to arousing mankind to the terrible potential of atomic warfare and to the folly of international disunity. He became chairman of the Emergency Committee of Atomic Scientists, a group that strongly advocated supranational control of atomic energy. His ultimate belief was that only total disarmament and a world federation could bring lasting peace.

Einstein had a profound compassion for the politically and economically oppressed. His political ideal was democracy, and he felt that economic planning was a necessary means of eliminating the inequalities inherent in contemporary political and economic systems. In November 1952, after the death of Chaim Weizmann, he was offered the presidency of Israel, but he declined the honor on the grounds that he was not suited for such a position.

Although he followed no orthodox religion, Einstein was by nature a devoutly religious man.

The striving "to experience the totality of existence as a unity full of significance" was the cosmic religion of which he not only spoke but also partook, especially in his approach to scientific research. He spent the mature years of his life in search of a few interrelated basic physical concepts that would unify the various and seemingly unrelated manifestations of the complex universe into one comprehensive synthesis.

Beginning where the Michelson-Morley experiment on the velocity of light (1887) left off, he developed the theory of relativity which held that only the relative motion of objects may be observed, and introduced a fourth dimension—time—as an essential of all physical measurement. This bold replacement of the traditional Newtonian notion of absolute space and absolute time by the idea of a space-time continuum gave scientists an entirely new point of departure in their study of cosmic law, and revolutionized man's view of the universe. It was this special theory of relativity (1905), moreover, that contained the now-famous equation $E = mc^2$ (E equals energy; m , mass; and c , velocity of light), which provided the key to the vast store of energy locked up within the tiny atomic nucleus. Up to that time, matter and energy were believed to be independent absolute entities. Einstein's formula postulated the revolutionary concept that matter and energy are actually different manifestations of one underlying entity: matter is frozen energy; energy is fluid matter. His equation was dramatically confirmed on July 16, 1945, when the first atomic bomb was exploded in New Mexico.

With the general theory of relativity (1916), an extension of the special theory, Einstein introduced a new and revolutionary concept of gravitation. The special and general theories together unified the hitherto unrelated concepts of space and time, matter and energy, and gravitation and inertia into one all-embracing principle, thus summing up, as Bertrand Russell said in 1924, "the mathematical and physical labors of more than 2,000 years."

Despite the magnitude of his achievement, Einstein had not finished his life's work. The universe seemed to flow in two parallel streams or "fields"—the gravitational and the electromagnetic. Only the first had been traced to its source in the geometry of the world—the curvature of the space-time continuum. There still remained the herculean and ultimate task of finding the common source of both "fields" in a larger cosmic pattern than was apparent.

In 1929, when he published his first efforts on a unified field theory, he believed he had arrived at a logically satisfying solution of the disturbing problem, but on closer examination found his insight to be incomplete. Late in 1949 his "generalized theory of gravitation" was announced, marking a further advance toward the synthesis he was seeking. He then announced in March 1953 that the last obstacle had been overcome, and published his findings in the appendix to the fourth edition of his work, *The Meaning of Relativity*. Nevertheless, his unified field theory, besides being at the time incapable of demonstrable proof, was unable to incorporate within its scope the atom and its component parts, which he referred to as "singularities in the field." Despite this crucial limitation he maintained unwaveringly that the concept of "the pure field" was the only real approach to the study of universal phenomena, and that eventually the atom and its components would be un-

Albert Einstein, renowned physicist, died at Princeton, N.J., on April 18, 1955, at the age of 76.

derstood in terms of the unified field principle.

Einstein's vision of the universe was opposed to that of the great majority of contemporary physicists, who champion the quantum theory, a concept of which, ironically, Einstein himself was one of the major architects. According to the quantum theory—which applies to the forces within atoms, whereas relativity applies to the forces governing the entire macrocosm—all forms of electromagnetic radiation are made up of discrete quanta (bundles) of energy. The material universe is dual in nature, all energy and all matter possessing the properties of both particles and waves. Modern quantum mechanics also leads to the concept that there could be no demonstration of causality in nature, and that all knowledge of events in the atomic world is based on probability and thus can be only statistical in nature.

Despite the dramatic successes of the quantum theory in elucidating many of the mysteries of the atom and radiation and of other properties of matter, Einstein, standing alone before the tide of scientific opinion, intuitively believed that a theory which postulated a universe governed by chance was at best an incomplete one. Thus he tried to prove that the universe of the stars and galaxies is one continuous field in which every event is determined by immutable laws of causality, and that the universe of the atom is governed by the same laws. "I cannot believe," he said, "that God plays dice with the cosmos."

During his lifetime the great physicist was honored by numerous universities and scientific societies throughout the world. He was also awarded the Nobel Prize in physics in 1921 (primarily for his explanation of the photoelectric effect) and the Franklin Institute Medal in 1935. Among his technical scientific publications are: *The Meaning of Relativity* (1923; 4th ed. 1953); *Sidelights on Relativity* (1923); *Investigation on the Theory of the Brownian Movement* (1926); *On the Method of Theoretical Physics* (1933); and *The Evolution of Physics* (with Leopold Infeld, 1938). His nontechnical works include: *About Zionism* (1931); *Why War?* (with Sigmund Freud, 1933); *The World As I See It* (1934); and *Out of My Later Years* (1950).

UNITED PRESS

President Eisenhower, here answering reporter's question, is the first president to have regular television coverage of his press conferences.

EIRE. See IRELAND, REPUBLIC OF.

EISENHOWER, Dwight David, 34th president of the United States: b. Denison, Texas, Oct. 14, 1890. During 1955, President Eisenhower continued to emphasize a middle-of-the-road approach to domestic problems, while in foreign affairs he stressed efforts to secure world peace. After a period of forced inactivity following a heart attack on September 24, he was able to resume direction of the administration, and by December 17 he had made such good progress that he was pronounced out of danger.

Reared in Abilene, Kans., Eisenhower entered West Point in 1911 and was graduated and commissioned a second lieutenant in 1915. During World War I he served as an instructor in various army camps and as commander of Camp Colt, Gettysburg, Pa. Subsequently he was graduated from the Infantry Tank School (1921), the Command and General Staff School (1926), the Army War College (1928), and the Army Industrial College (1933). Between 1929 and 1935 he was assigned to the offices of the assistant secretary of war and of the chief of staff, and from then until 1939 served as assistant to Gen. Douglas MacArthur in the Philippines.

Eisenhower won distinction at maneuvers held in Louisiana in 1941, and on September 29 of that year was appointed to the temporary rank of brigadier general. In February 1942, he became head of the War Plans Division and, in March, of the new Operations Division of the War Department General Staff. In November, he directed the Anglo-American assault on French North Africa, and on Feb. 11, 1943, was named commander in chief of all Allied forces in North Africa. Later in 1943 he led his forces into Sicily and southern Italy. On December 24, he was named supreme commander of the Allied Expeditionary Force and went to London to direct preparations for the invasion of France on June 6, 1944. He was promoted to the rank of general of the army in December, and on May 7, 1945, received the unconditional surrender of Germany.

He served briefly as commander of United States occupation forces in Germany; was named army chief of staff in November 1945; and was installed as president of Columbia University in October 1948. From February to August 1949, on leave from Columbia, he served as temporary chairman of the Joint Chiefs of Staff, and in De-

cember 1950 became supreme Allied commander in Europe. Retiring from the army in June 1952, he received the Republican nomination for the presidency in July, was elected by an overwhelming majority in November, and took office on Jan. 20, 1953.

In his State of the Union message, delivered on Jan. 6, 1955, President Eisenhower began his third year in office by asking the new, Democratic-controlled 84th Congress for its cooperation. His legislative proposals, outlined in this message, were elaborated in his budget message (January 17), in which he forecast expenditures of \$62.4 billion and revenues of \$60 billion in the fiscal year 1956; in the economic report (January 20), in which he predicted an expansion of the economy; and in various special messages. Among these were requests for a three-year extension of the Reciprocal Trade Agreements Act, with authority to cut tariffs by 5% a year for three years (January 10); rises in postal rates and in postal and other federal salaries (January 11); extension of the draft to 1959, a stronger Reserve program, and higher military pay (January 13); a federal health reinsurance program (January 31); a federal-state-local program of school construction, costing \$7 billion (February 8); a 10-year, federal-state-local program of highway construction, which would cost \$101 billion and be financed by special bond issues (February 22); a \$3.5 billion program of foreign aid (April 20); and 10 amendments to the Refugee Relief Act of 1953 (May 27).

In general, the president's legislative program did not differ greatly from that presented in 1954. Innovations included a request that the minimum wage be raised to 90 cents an hour, the Reserve program, and the plan for school construction. In foreign affairs, Congress fulfilled the president's requests in a manner which he characterized as commendable in a press conference on August 4, but the domestic program proved more controversial. In some instances, as in raising the minimum wage to \$1, Congress went beyond the president's proposals; but it shelved others, including those for highways, school construction, and health.

During 1955, President Eisenhower appointed two important new bodies: the Committee on Government Employment Policy, on January 18; and the Commission on Government Security, on November 10. The Foreign Operations Administration (FOA) was replaced by the International Cooperation Administration (ICA), of which the president named John B. Hollister director on April 30. Harold E. Stassen, director of the FOA, was appointed special assistant on disarmament on March 19.

The president met criticism of administration programs by approving seven revisions of the federal security program (March 5), canceling the Dixon-Yates contract (July 11), and issuing a new order on conflicts of interest of men serving the government without compensation (November 28).

In foreign policy, President Eisenhower was concerned during the early part of 1955 with threats by Communist China, and on January 28, Congress gave him requested authorization to use armed force if necessary in the defense of Formosa and the Pescadores. On March 10, to hasten ratification of the expanded Western European Union, he sent letters to the premiers of its proposed members, reiterating United States determination to maintain defense forces in Europe. He signed the instruments of ratification of the

Paris pacts on the sovereignty of West Germany and its admission to the North Atlantic Treaty Organization on April 7, and that of the Austrian State Treaty on June 25. With regard to his Atoms for Peace plan, he proposed, in a speech of June 11, that the United States furnish friendly nations with research reactors and training in their construction and operation; authorized the Atomic Energy Commission on June 24 to increase grants of enriched uranium to friendly nations from 220 to 440 pounds; and sent an encouraging message to the International Conference on the Peaceful Uses of Atomic Energy, held on August 8-20. In a speech at the opening of the tenth anniversary meetings of the United Nations in San Francisco on June 20, he reaffirmed United States support of the organization.

At first skeptical of the value of a Big Four conference, Eisenhower offered on May 10 "to meet with anyone, anywhere," in the cause of peace. At the Geneva Conference (q.v.), held on July 18-23, he suggested an exchange of military blueprints and aerial surveys by the United States and the Soviet Union. His proposals were embodied in a disarmament resolution passed by the U.N. General Assembly on December 16.

The president's views on both foreign and domestic affairs were presented to the public in a more dramatic fashion in 1955, with the filming of his news conferences for television from January 19 until his departure from Washington in August. It was while he was on vacation in Denver in September that the nation was shocked to learn that he had suffered a coronary thrombosis. He made steady progress in recovering his health, however, and on November 11 was discharged from the hospital. Three days later he went to his farm near Gettysburg, where a temporary White House was set up in the post office.

(See also FOREIGN POLICY OF THE UNITED STATES; UNITED STATES—*The United States in 1955.*)

ELECTIONS, U.S. The results of elections held in 1955 generally showed a continuation of the Democratic trend noted in the preceding two years. In the general elections of November 8, the Democrats retained the Philadelphia mayoralty by an overwhelming majority, with the victory of Richardson Dilworth over W. Thacher Longstreth, and they registered gains in municipal elections in Indiana and Connecticut and in the New Jersey Senate. Previously, on April 5, they had succeeded in retaining the mayoralty in Chicago, with the election of Richard J. Daley. The Republicans captured the mayoralty in Denver, with the victory of Will F. Nicholson on June 21, and in November they increased their representation in the Virginia House of Delegates.

There were only two gubernatorial elections in 1955, both held on November 8. In Kentucky, Albert E. Chandler, making a political comeback, defeated Republican Edwin R. Denney; and in Mississippi, Democrat J. P. Coleman was elected without opposition. In elections held to fill vacancies in the U.S. House of Representatives, the Democrats retained the two seats at stake, sons succeeding their fathers in both instances. Paul G. Rogers (6th Congressional District, Florida) was elected on January 11, and John D. Dingell, Jr. (15th Congressional District, Michigan) on December 13.

Mayors elected in 1955 in leading cities included the following (R=Republican; D=Democrat; D-L=Democrat-Liberal; NP=non-partisan):

Baltimore, Md.—Thomas D'Allesandro, Jr. (D), re-elected May 3
 Boston, Mass.—John B. Hynes (NP), re-elected Nov. 8
 Bridgeport, Conn.—Jasper McLevy (Socialist), re-elected Nov. 8
 Chicago—Richard J. Daley (D), elected April 5
 Cincinnati, Ohio—Charles P. Taft (City Charter Committee), elected Dec. 14 from the city council, which was elected Nov. 8
 Cleveland, Ohio—Anthony J. Celebrezze (D), re-elected Nov. 8
 Denver—Will F. Nicholson (R), elected June 21
 Evansville, Ind.—R. Vance Hartke (D), elected Nov. 8
 Fort Wayne, Ind.—Robert Meyers (R), re-elected Nov. 8
 Gary, Ind.—Peter Mandich (D), re-elected Nov. 8
 Hammond, Ind.—Edward Dowling (D), elected Nov. 8
 Hartford, Conn.—Joseph V. Cronin (NP), elected Nov. 8
 Indianapolis, Ind.—Phillip L. Bayt (D), elected Nov. 8
 Little Rock, Ark.—Woodrow W. Mann (D), elected Nov. 8
 Memphis, Tenn.—Edmund Orgill (D), elected Nov. 10
 Miami, Fla.—Randall N. Christmas (D), elected Nov. 15
 New Haven, Conn.—Richard C. Lee (D), re-elected Nov. 8
 Niagara Falls, N.Y.—Calvin L. Keller (R), elected Nov. 8
 Paterson, N.J.—Edward J. O'Byrne (D), elected Nov. 8
 Philadelphia—Richardson Dilworth (D), elected Nov. 8
 Salt Lake City, Utah—Adiel F. Stewart (NP), elected Nov. 8
 San Francisco, Calif.—George Christopher (NP), elected Nov. 8
 Schenectady, N.Y.—Samuel S. Stratton (D-L), elected Nov. 8
 South Bend, Ind.—Edward Voorde (D), elected Nov. 8
 Springfield, Mass.—Daniel Brunton (D), re-elected Nov. 8
 Utica, N.Y.—John T. McKennan (D), elected Nov. 8
 Waterbury, Conn.—Edward D. Bergin (D), elected Nov. 8
 Yonkers, N.Y.—Kristen Kristensen (R), re-elected Nov. 8

ELECTRICAL DEVELOPMENTS. Progress in 1955 can best be measured by the outstanding developments in communications and by the new records established in the generation of electric power in the United States. Several private utility companies and combinations of companies received the Atomic Energy Commission's approval to start constructing electric power stations using reactors as a source of energy. The year marked the first International Conference on the Peaceful Uses of Atomic Energy, in August at Geneva, Switzerland (see ATOMIC ENERGY); in December the engineering societies of the country sponsored an Atomic Energy Congress and exhibition in Cleveland, Ohio.

Research.—The Naval Ordnance Research Calculator (NORC) was delivered to the U.S. Navy's Computation Laboratory in 1955. Because other "giant brains" were incapable of solving naval research problems quickly enough, International Business Machines Corp. engineers developed NORC. This machine carries out 15,000 complete arithmetic calculations per second. Eight high-speed magnetic tapes bring data to the calculator at the rate of 70,000 decimal digits per second. Similar tapes are used for storage of intermediate results and output. NORC can add or subtract 13-digit numbers in 15 microseconds and multiply numbers of like size in 31 microseconds. Numbers stored in the calculator's cathode-ray tube "memory" can be recalled from any one of 2,000 locations in 8 microseconds.

A light amplifier with no electron tubes has been developed by the General Electric Co. (see ELECTRONICS). This device has possible uses in television, X-ray fluoroscopy, etc.

An electron-image tube that can translate coded signals from tape, keyboard, or radio into clearly defined letters and figures up to 100,000 words per minute for high-speed photographic recording has been announced by the Radio Corporation of America. Its possible commercial uses are in electronic message transmission and in computing systems.

Power Generation.—A 5,500-kw. gas turbine-

GENERAL ELECTRIC COMPANY

Electricity produced by nuclear energy is distributed commercially for the first time at West Milton, N.Y., on July 18, 1955. Here Atomic Energy Commission Chairman Lewis L. Strauss closes the switch at General Electric Company's submarine nuclear reactor plant, automatically taking the picture as the current begins to flow.

electric generator power plant was built for the U.S. Navy in 1955 by Clark Brothers Co., one of the Dresser Industries. The complete plant is mounted on a railroad car which can be moved to any place where an emergency exists. The plant consists of a diesel engine to start the unit, a Clark gas turbine, and fuel pumps. The unit needs connections only to fuel and transmission lines.

One of the historical events of 1955 was the piping of the steam from the prototype submarine nuclear reactor at the West Milton, N.Y., plant of General Electric Co. to a 10,000-kw. turbine generator. Beginning on July 18, the electrical power produced was supplied to northeastern New York State over the lines of the Niagara Mohawk Power Corp. This was the first time that electricity produced from nuclear energy was distributed and sold on a commercial basis in the United States. However, on the previous day (July 17), for a short period of time, electricity produced by the "Borax" reactor, operated by the Argonne National Laboratory at the National Reactor Testing Station near Arco, Idaho, was fed to the town of Arco over the lines of the Utah Power and Light Company.

After several years of research, the Elgin National Watch Co. has announced a 1.15-volt indium cell to replace the mercury cells now used commercially. The new cell is about the size of a penny, but thicker; it is built into a leak-proof plastic case, has a service life of two years, and has constant operating characteristics from 0° to 120° F.

Industrial Equipment and Applications.—Bell Telephone Laboratories have developed a machine that can automatically wire complex electric apparatus. Instructions are fed to the machine from a punched tape. A series of relays translates the information into electric signals that actuate the machine to cut off sufficient wire, strip the proper length of insulation from

it, and wind the bared wire around terminals of electronic components on a panel.

A successful experimental model of an embroidery machine responds to ordinary 5-unit binary-recorded paper tape and standard printing-telegraph apparatus with minor adjustments. It responds to tape control at the average rate of 500 stitches per needle-minute. This development has contributed to the idea of the automatic factory in which unit machines can be ganged together and remotely controlled for labor economy and maximum machine-hours utilization.

Ultrasonic vibrations which are electrically generated have been used in several ways. They can detect certain flaws in metals; when applied to a liquid, they clean or degrease immersed delicate work parts so small they cannot be cleaned by hand; they can actuate a tool that will cut, with a drill head of any geometric form, into the hardest metals and ceramics. Ultrasonic frequencies used in this machine vary from 18 kc. to 500 mc., depending on the type of work.

The "Autofab" is the first automatic assembly machine for attaching electronic components to printed circuits. It was developed by General Mills, Inc., and sold to International Business Machines Corp. The latter firm uses the machine for producing printed circuit assemblies for the computers it is building for the U.S. Air Force. Its estimated capacity is 200,000 units per month with three workers attending it.

Transportation.—The second atomic-powered submarine, U.S.S. *Seawolf*, was launched on July 21, 1955, at the Electric Boat Division of General Dynamics Corp., Groton, Conn. The *Seawolf's* power plant differs from that of the *Nautilus*, which underwent sea trials in 1955. The new design is known as the submarine intermediate reactor and is cooled by liquid sodium, whereas the *Nautilus* reactor is cooled by high-pressure water.

Electronics is controlling Chicago automobile traffic in certain areas. At predetermined times each day a master mechanism in the central control station activates a tone signal which is transmitted by radio from the Board of Trade Building to traffic light receivers. A decoder at each light selects the signal intended for its intersection and ignores all others. The corresponding tone switch in the traffic light will respond to its own tone by changing the program of the lengths of time the colored lights are on. This changing program is automatic but can be manually controlled in emergencies or during bad weather.

The Otis Elevator Co. has demonstrated the prototype of its Trav-O-lator, an electrically driven series of cleated treads, like those of an escalator. The treads run on tracks horizontally or on an incline to higher or lower levels. Grades up to 14 degrees can be used, and speeds up to a maximum of 180 feet per minute, without discomfort to passengers.

Communications.—The first of the new twin transatlantic telephone cables was laid from Clarenville, Newfoundland, to Oban, Scotland, a distance of about 2,100 miles, in the summer of 1955, from H.M.T.S. *Monarch*. Each of the two cables has 52 voice amplifiers spaced about 40 miles apart, and these had to be slim and flexible enough to pass through the *Monarch's* laying gear.

The American Telephone and Telegraph Co. also has proposed similar cables to be laid between Port Angeles, Wash., and Alaska, and between the United States and Hawaii, to handle increased telephone traffic.

A new long-distance telephone center, which will be the hub of a dialing network for the United States, was placed in service in April 1955 at St. Louis, Mo. This installation brings the number of cities and towns on the distant-dialing network to approximately 3,600.

After many years of research, ultra-high-frequency (UHF) radio signals have been successfully transmitted as far as 200 miles. This over-the-horizon transmission is accomplished with 10-kw. transmitters and antennas 60 feet in diameter (20,000 times the power and 30 times the antenna area used in the present microwave transcontinental radio relay system). (See also RADIO AND TELEVISION; TELEGRAPHY; TELEPHONE.)

Illumination.—Variable-reactance dimming is a new method of brightness control for fluorescent lamps developed by the General Electric Co. It has the advantage of smooth dimming over a wide range from 50 to 1, by means of a variable impedance in series with the lamp and ballast.

A new efficient fluorescent lighting system has been installed in the Field House of Union College, Schenectady, N.Y., by the General Electric Co. A frequency of 400 cycles is used instead of the usual 60 cycles. This installation cost 10% less than an incandescent-mercury system to install, and it is estimated that the annual operating cost will be cut in half, despite a production of 20% higher levels of comfortable light.

Because helicopters have unusual maneuvering characteristics, they need lights on their blade tips at night to distinguish them from other types of aircraft. The Westinghouse Lamp Division has developed a 12-volt lamp which will withstand the great centrifugal forces existing at the tips of the rotating blades. These forces can exceed 700 g. and reach 1,000 g. under certain conditions.

Metallurgical and Chemical Applications.—A new concept of physics which will open up unlimited fields of airborne geophysical exploration has been announced by Varian Associates, the firm which invented the klystron tube. The new instrument uses hydrogen nuclei contained in any tap water to record minute changes of the earth's magnetic field, which in turn may indicate the presence of mineral or petroleum deposits. The "bird," which is trailed behind a survey airplane, measures total magnetic field

without regard to direction; it consists of little more than a jar of water with a coil around it, the whole being enclosed in a streamlined cone.

A practical germanium power rectifier that is applied to industry in the form of a d-c power supply has been developed by the General Electric Co. It is used in the chemical, aluminum, steel, titanium, and tin reclaiming industries. Ratings such as 16,000 amperes at 65 volts, 12,000 amperes at 130 volts, and 40,000 amperes at 24 volts are being produced.

Electromedical.—Faint sounds of the human heart which cannot be detected even with a physician's stethoscope can be seen now with the Electro Stethograph. This instrument combines the stethoscope with the sensitive pickup of the General Motors Surfactage, which measures roughness of highly machined automobile parts. Very-low-frequency sounds of the heart are pictured on a chart, and it is believed that the study of these sounds will offer new clues to the heart's behavior.

Electronics.—An investigation of television as an instructive medium at Fort Monmouth, N.J., showed that U.S. Signal Corps students learned technical subjects better by means of "live" television lectures than by motion pictures. The same was true of interns at several hospitals where surgeons explained their operating procedures before color television cameras.

Closed-circuit television at the Portland, Ore., airport shows passengers and operating personnel flight information as it is written on a blackboard in the operations center. Highway police are using the system to control traffic in the half-mile tunnel on the West Virginia Turnpike, and branch banks are using it to verify signatures on file in their central offices.

An electronic music synthesizer has been developed by the Radio Corporation of America. Its operation is based on the breakdown of a tone into its characteristics (frequency, intensity, timbre, etc.). This instrument utilizes a paper tape in which holes are punched from a typewriter-like keyboard, and which actuates electronic circuits whose outputs are recorded on phonograph discs which are played on a conventional record player. The sounds of any musical instrument or combination of instruments can be synthesized.

A counter-mortar radar has been developed by the U.S. Signal Corps and Sperry Gyroscope

General Electric's new micro-miniature ceramic triode (right), for use in ultra-high-frequency television receivers, compared with conventional glass tube (left) and miniature type tube (center).

GENERAL ELECTRIC COMPANY

Five-tube radio receiver at the right was wired by ordinary soldering methods; that at the left, by ambidextrous "M-4" machine, using an automatic process for making solderless wrapped connections in complex apparatus.

BELL TELEPHONE LABORATORIES

Co. This instrument can detect and trace the path of enemy mortar shells automatically, and reveals the site of the enemy's guns from which the projectile was fired.

An electronic writing device has been announced by Autron Engineering, Inc., which can transmit instantaneously any type of written intelligence (drawings, maps, numerals, etc.) to a remote receiver either by radio or over wires.

A micro-miniature ceramic triode, $\frac{3}{8}$ inch long and $\frac{5}{16}$ inch in diameter, for use in ultra-high-frequency television sets, has been developed by the General Electric Co. It is designed to operate at 900 mc.; has a power gain of 15 db. and a band width of 10 mc.; and functions at temperatures up to 700°C.

Experimental "junction tetrode" transistors which oscillate at a billion cycles have been developed by Bell Telephone Laboratories. (See also ELECTRONICS.)

ELECTRIC LIGHT AND POWER INDUSTRY

Power Plant Generating Capacity.—The generating capacity of American power plants continued to expand in 1954 at an increased rate over 1953. In 1954, 11.4 million kw. was added, bringing the total nameplate capacity to 102,520,000 kw. (estimated), an increase of approximately 12% over 1953. Steam led again as a prime mover, with 77 million kw., an increase of 10 million kw. over 1953; hydroelectric power ranked second with 23.2 million kw.; and internal combustion ranked third with 2.2 million kw. It is estimated that the total assets of utility plants for 1954 was approximately \$31.4 billion.

U.S. Power and Light Production.—The demand for electric power has continued to expand steadily in the United States. The utility industry produced 472 billion kw.-hr. in 1954, and 73 billion kw.-hr. was generated by nonutility sources. Approximately 2 billion kw.-hr. imported from Canada and Mexico should be added to these figures, bringing the total to 547 billion kw.-hr.

Records of weekly power production continued to be broken in 1955. The peak output of 1954 was about 9.9 billion kw.-hr. early in December. This figure was exceeded every week in 1955 after the middle of July. It was estimated that an 11-billion-kw.-hr. week would be exceeded before the end of the year.

U.S. Energy Sales and Revenues.—In 1954, 410.9 billion kw.-hr. of electrical energy was sold to 51.2 million ultimate consumers, providing a revenue of \$7.3 billion to the utilities. Thus, energy sales showed increases of 6.9% in quantity, 2.6% in consumers, and 7.1% in revenue over figures for 1953.

TABLE 1—U.S. ELECTRIC ENERGY SALES AND REVENUES, 1954.

Classification	Customers (number)	Revenue (millions of dollars)	Distribution (millions of kw.-hr.)
Commercial, industrial.	6,272,400	3,824	273,500
Domestic.	43,140,000	2,920	108,500
Rural.	1,637,500	216	10,200
Highway, illumination.	38,400	124	4,000
Railroad, railways.	115	54	4,700
Other.	124,900	133	9,400

(Source: Edison Electric Institute.)

Operating revenue of the investment-owned electric utilities for 1954 was estimated to be \$6.31 billion, on which taxes were estimated at \$1.44 billion. These are increases of 6.2% and 7.3%, respectively, over 1953. (See also PUBLIC UTILITIES.)

World Electric Energy Production.—Production of electric energy by major countries is shown in Table 2.

TABLE 2—ELECTRIC ENERGY PRODUCTION BY MAJOR COUNTRIES, 1954

Country	Output (millions of kw.-hr.)	Country	Output (millions of kw.-hr.)

Associate Editor, "Electrical Engineering."

ELECTRIFICATION, Rural. See RURAL ELECTRIFICATION ADMINISTRATION.

ELECTRONICS. Considerable progress was made in 1955 by the industry dealing with tubes, transistors, and other electronic devices. The sales volume of \$9 billion achieved during the year led one leading United States manufacturer to predict a rise to \$20 billion in the next decade.

Of the 500 largest United States industrial concerns—each with annual sales of \$50 million and over—101 have some interest in the electronics business. This interest may range all the way from manufacturing radio and television sets almost exclusively to support of a small electronic research and development subsidiary, or production of small parts. These 101 firms have an annual sales volume of more than \$40 billion and assets of nearly \$26 billion.

Transistors.—The year 1955 saw the introduction of transistors into products which can be used by virtually all consumers. Previously the big market for these tiny devices had been in hearing aids, of which several million units have been sold. Mass production of transistors at prices comparable to those of vacuum tubes, and capable of operation at radio frequencies was not accomplished until 1955. Several radio receiver manufacturers brought out transistorized models during the year. Tiny enough to be carried in a pocket, these radios permit extreme economy of battery power. A few phonographs and automobile radios with transistors were also introduced.

The Signal Corps is field-testing a quantity of developmental FM transceivers, designed for communications over a quarter-mile range. These pocket-size sets consist of a receiver-transmitter, microphone-earphone, collapsible antenna, and battery in a 15-ounce assembly. The transceiver contains 12 transistors and one tube. It incorporates an all-transistor superheterodyne receiver and a two-transistor, one-tube transmitter. Up to ten hours of operation are provided with a single battery.

Tubes in Industry.—The current trend in petroleum refinery instrumentation is toward automatic logging—centralized recording of measurements taken throughout the refinery to provide a detailed record of operations. A \$50,000 system designed to monitor, analyze, and record 480 process variables will be installed in one Montreal refinery with a capacity of 20,000 barrels per day. Each hour the logger will type out the value of all variables, and in case of trouble the

out-of-line condition and its location will be typed out. The instrument will also compute total flow, efficiency ratios, and yield factors, and will punch significant data into paper tape or cards for preparing summary reports to the management. About ten refineries have installed electronic logging systems costing from \$5,000 to \$50,000.

Use of electronic control in metalworking operations has been increasing steadily. Some of the development work by machine-tool builders has been done by electronics companies under contract, while other tool builders have set up their own electronics departments. One machine developed is a punched paper-tape controlled automatic boring machine for producing instrument gear trains. It consists of a precision boring machine modified with built-in electronic controls and circuitry, and a tape reader housed in a control cabinet. Hole coordinates and feed instructions are punched on the tape by a perforating machine similar to a typewriter. Electronic signals from the tape regulate the linear travel of the boring machine's hydraulic cross-slide and the rotary motion of a holding fixture mounted on the cross-slide. Tape preparation requires approximately 5 minutes per hole, and complete changeover from one part to another can be accomplished in about 30 minutes.

Several electronic manufacturers have entered into agreements to make and market electronic equipment developed by major oil companies. Plant analysis and control equipments planned include an infrared gas analyzer, a differential refractometer, an ultraviolet analyzer, and an oxygen analyzer. Other devices include level controls and engine analyzers that can diagnose auto ignition faults in less than one minute.

Space Satellite.—The launching and flight of the first earth satellite will involve considerable electronic equipment. Projected as a part of the United States program of participation in the International Geophysical Year (1957-58), the artificial satellite (which is expected to be a 21½-pound, basketball-like object) will be placed on orbit some 250 or more miles above the earth by rocket techniques (see SPACE FLIGHT). It will give opportunities for scientific measurements of the upper atmosphere. Out of approximately 90 minutes in which it will initially encircle the earth, perhaps 3 to 5 minutes will be available for experimentation. The mass of electronic equipment to be used in launching and tracking the satellite will probably remain classi-

Model cockpit shows simplified aircraft instrumentation and controls. Circular and semicircular television screens, using "flat" cathode-ray tubes, provide flight information for the pilot.

U. S. NAVY

SOCONY-VACUUM OIL CO.

Automobile engine defects are shown on screen of electronic engine analyzer, eliminating repair guesswork.

fied. On the ground, the important electronic equipment will certainly include telemetering and tracking equipment. Electronic computers will bulk large in maintaining accurate tracking of the satellite, and will also indicate slowing up of the satellite and make possible measurements of retarding forces.

Flat Cathode-Ray Tube.—Differing radically from conventional funnel-shaped cathode-ray tubes, a new flat tube holds promise of revolutionizing the television industry and simplifying aircraft instrumentation. The new tube consists of a phosphor screen mounted between flat sheets of glass. The entire unit is evacuated. The electron beam is injected along a horizontal edge of the tube and flows in a field-free region along this edge, adjacent to a row of transverse deflection plates. By controlling the voltages on these plates, the electron beam is bent at any desired place along the edge of the tube. The beam then flows vertically in a second field-free region between a series of transparent horizontal deflection plates and the electrically charged phosphor screen. By controlling the voltages on the horizontal deflection plates, the beam is deflected into the phosphor screen at any desired vertical level. A raster is scanned by sequentially changing the voltage on the transverse (vertical) and horizontal deflection plates simultaneously.

Tubes having useful screen areas comparable to those of 24-inch conventional tubes have been built. The new tubes have an approximate depth of only 3 inches, in comparison with approximately 20 inches for the conventional tubes.

One model of the new tube was adapted for the U.S. Navy's long-range program for simplifying aircraft instruments. This program will result in an instrument panel consisting of only two basic instruments, both picture tubes. One instrument will be a semicircular plate mounted vertically and directly in front of the pilot. It will be transparent and will not interfere with the pilot's vision during contact flight. Altitude, speed, and attitude of the aircraft will be shown on the plate. Physical features such as mountains, which the pilot sees during contact flight, will be depicted artificially. The second instrument will consist of a round plate mounted below the first, just inside the cockpit rim. Its appearance will be similar to that of a radar map. Broad physical features of the earth below will be depicted by analogy. Calibrations around the rim will indicate the number of miles to the pilot's

base, the amount of fuel remaining, and similar information.

Because picture tubes are used, several items of information can be selectively superimposed in the same area, to be used as needed. The tubes will not be used to present an actual picture of what is happening in the vicinity of an aircraft. The display the pilot sees will be an analogy of the visual world that he would see if flying by contact in clear weather.

Vision in the Dark.—There are now about 1,000 to 1,500 infrared viewers, modern versions of the wartime sniper-scope, in use. Such instruments have only recently been made available for civilian application. Compact and portable, the units weigh approximately 10 pounds and cost \$500 to \$1,000, depending on the quality of design as well as on the optics supplied. Film manufacturing and processing laboratories use the scopes to monitor film-manufacturing operations in darkness. Nearly 200 of them are distributed among three major film firms. The viewers are also finding increasing use in security applications, and police patrol cars are using them to observe suspects in darkness.

In industry the infrared-sensitive viewers are used in determining temperature distribution at heats above 250° C., as well as in warehouse surveillance. In detecting cases of forgery, when an original signature has been mutilated or erased and written over, the viewer has proved particularly useful. Medical applications include psychological and psychiatric study when it is desired to study a subject under conditions of complete surprise to stimuli. The scopes are used also for signaling on land and sea. Standard sensitivity is one candlepower at one mile. With a pulsed infrared light source, signals are good for ten miles, day or night.

Radar Helmet.—Ground observers get an all-weather eye with a new microwave receiver using transistors to reduce weight and power drain. The radar receiver is mounted on helmets designed for the U.S. Air Force's civilian Ground Observer Corps. With the receiver, part-time aircraft spotters can pick up a plane's search, navigation, or fire-control radar. The microwave horn antenna picks up the signal which is passed through a crystal detector. Transistors on a printed circuit board provide a pulse amplifier, and signals from the amplifier are fed directly to lightweight headphones. A four-ounce battery supplies the power required for a week under normal conditions.

Light Amplifier.—Direct amplification of light without electron tubes can be accomplished by a 10-micron film of phosphor sandwiched between conducting plates, one of which is made of electrically conducting glass. Possible applications include X-ray fluoroscopy, photography, and see-in-the-dark devices utilizing ultraviolet sources. The light amplifier may also brighten television images and aid development of picture-on-the-wall screens.

At a demonstration of the principle involved, a fluorescent screen four inches across was illuminated with ultraviolet light from a slide projector. Then d-c voltage was applied to the conducting plates, and a yellowish image was produced. The glow became brighter as the voltage was increased to about 100 volts. Application of ultraviolet light with no voltage on the light amplifier caused only a faint glow. The phosphor film, consisting of zinc sulfide activated with manganese, is vapor-deposited at high temperature and low pressure. The chemical content of

the film determines what radiation wavelengths the light amplifier will accept, and what wavelengths will be returned. (See also **ELECTRICAL DEVELOPMENTS**; **RADIO AND TELEVISION**; and the Index entry, *Electronics*.)

VIN ZELUFF,
Managing Editor, "Electronics."

ELLICE ISLANDS. See **WESTERN PACIFIC ISLANDS, BRITISH**.

EL SALVADOR. The smallest and most densely populated of the Central American republics, El Salvador is bounded on the north by Guatemala, on the east by Honduras, and on the south and west by the Pacific Ocean. Its area is 8,260 square miles, according to a recent survey (the area was formerly thought to be 13,176 square miles). According to the June 1950 census, the population totaled 1,855,917 (July 1954 est., 2,087,999). About 64% of the population was classified as rural. The chief cities (with 1953 urban populations) are San Salvador, the capital (194,618), Santa Ana (109,711), San Miguel (63,429), Nueva San Salvador or Santa Tecla (32,204), and Sonsonate (25,675). Over 90% of the population is of mixed Indian-European descent. Spanish is the official language.

Government.—The Constitution of 1950 vests executive power in a president (Lieut. Col. Oscar Osorio, inaugurated Sept. 14, 1950) who is elected by popular vote for a 6-year term, and is not eligible for an immediate second term. Legislative power is vested in a Legislative Assembly of 52 deputies elected by direct vote for 2-year terms. The governors of the 14 departments into which the country is divided are presidential appointees.

Religion and Education.—Roman Catholicism is the predominant religion, but the constitution guarantees freedom of worship. Primary education is free and compulsory, but lack of funds has made it impossible to provide facilities for all school-age children. According to the 1950 census, some 57% of the population 10 years of age and older was illiterate. A governmental literacy campaign in recent years has shown some results. In 1952 and 1953, as indicated, school enrollment was: primary, 197,188 (1953); secondary, 14,674 (1953); technical, 4,135 (1952); and teacher-training, 1,730 (1952). At the National University in San Salvador there were 2,512 students in 1953.

Finance.—The unit of currency is the colón, equivalent to U.S.\$0.40. The government's fiscal position is highly dependent on coffee production and export; with high coffee prices and large crops in recent years, that position has been relatively strong. Gold and foreign exchange reserves were slightly higher at the end of 1954 (\$47,040,000) than a year earlier (\$45,120,000). The national budget for 1955 provided for expenditures of \$65,100,000, as compared with \$60,780,000 for 1954. Preliminary estimates indicate that actual revenues for 1954 were \$66,100,000; and revenues for 1955 are expected to total \$62,212,774. Prices increased only slightly in 1954, with the wholesale price index of the Central Bank (1939 = 100) at 558.31 in January 1954, and at 535.52 in December. The cost-of-living index for a workingman's family (1937 = 100) rose from 240.30 to 266.40 during 1954.

Production.—Most of the population depends on operations directly related to agriculture. The census of 1950 found that of the 653,409 economically active persons 10 years of age and older, 412,646 were in agriculture, which accounts for over 41% of the gross domestic product. Coffee is the dominant crop, accounting for nearly one half of agriculture's contribution to the gross product, and usually over 80% of the value of exports. The most important food crops are corn, beans, sorghum, rice, and sugar. In 1954 El Salvador was virtually self-supporting in all these items, except for corn.

The 1954-55 coffee crop was estimated at 1,200,000 bags (132.3 pounds each), a 30% rise over the 1953-54 crop. Excellent coffee prices until August 1954 kept export values at a high level. Outlook for the 1955-56 crop is not so favorable.

Cotton cultivation and export continued the upward trend of recent years. The production of lint cotton from the 1954-55 crop is estimated at 60,000 bales, compared with 54,000 from the 1953-54 crop. Some 48,000 bales of the 1954-55 crop were in excess of domestic requirements, and available for export. Indications are that approximately 83,000 acres will be planted to cotton for the 1955-56 crop, compared with 73,000 acres in 1954-55.

Mineral production, never important, fell to a new low in 1954, with small amounts of silver and gold being produced. Deposits of these metals were apparently about worked out.

The few light industries generally increased production in 1954, although output of some lines (for example, tobacco, cigarettes, and beer) dropped slightly. Construction of a \$1.3 million soluble coffee plant began early in 1955. (See also below, *Principal Events, 1955.*)

Foreign Trade.—The value of foreign trade continued upward during 1954 to new record levels. The usual favorable balance of trade was maintained. (Since the beginning of the century, El Salvador has had a favorable balance in all but four years.) The value of exports (mostly coffee shipped to the United States) in 1954 was about \$105 million, compared with \$90 million in 1953. Imports for 1954 were approximately \$87 million, as compared with \$72 million in 1953. In 1954 the United States continued to import the bulk of El Salvador's exports, and to supply over half of her imports.

Transportation and Communications.—Two railway companies operate in El Salvador, with a total main track of 385 miles, and connections with the rail systems of Guatemala. The San Salvador airport is served by 3 international airlines. The highway system is better than average for Central America: about 375 miles of paved roads, connecting all the principal cities and seaports, and linking El Salvador with Guatemala and Honduras; 375 miles of other improved all-weather roads; and perhaps 1,200 miles of unimproved dirt roads and trails. The Inter-American Highway runs through the country, with only 21 miles of its 197 miles unpaved. Late in 1955, work was about to begin on a 190-mile, all-weather Pacific coastal highway, largely financed by a loan from the International Bank for Reconstruction and Development.

Principal Events, 1955.—Chief political interest in 1955 centered around the campaign for the presidency. Although by October no date had been set for the election, it was expected to occur in September 1956. Campaigning began late in 1954, and increased in intensity throughout 1955, with a number of candidates having registered their parties with the Ministry of the Interior. By fall no candidate had acquired a favorable position, and some businessmen felt that political uncertainty was responsible for weaknesses in some sectors of the economy. There was also a flurry of political excitement when former President Maximiliano Hernández Martínez (1931-44) returned from exile.

Although prosperity carried over from 1954 into 1955, the press and government showed continuing interest in closer economic and political ties with the rest of Central America. This was in part due to the shortage of corn, caused by drought, and by the increasing devotion of agricultural land to cotton culture. A rise in the price of foodstuffs caused concern, and necessitated imports.

The government continued its interest in di-

versification of the economy. A decree in January controlled imports of coarse sacking to protect the domestic henequen bag industry. New legislation favored industry generally by allowing tax-free importation of industrial materials, equipment, and machinery. A fund of 60 million colones (\$25 million) was made available by industrial concerns to back the government's efforts to promote industry. Electricity output was up sharply due to production at the new Río Lempa hydroelectric project.

EMPLOYMENT. See BUREAU OF EMPLOYMENT SECURITY; CENSUS DATA, U.S.; LABOR; and the Index entry, *Employment.*

ENDOCRINOLOGY. With the perfection over the past several decades of specific chemical and hormone assay techniques, the art of clinical endocrinology has gradually become more and more exacting. There are now very accurate and well-defined syndromes of overfunction and underfunction of all the endocrine organs. In most instances when definite endocrine disease is found, there is a very specific and satisfactory treatment available. This is in remarkable contrast to previous decades, when clinical endocrinology was a vague and often unsatisfactory clinical art, dependent upon rather impotent therapeutic agents.

Adrenocortical Overactivity.—Recently a new clinical syndrome, primary aldosteronism, has been defined by Dr. Jerome Conn of the University of Michigan. For some time it has been recognized that the adrenal cortex secretes a potent salt- and water-controlling hormone which recently was isolated and called electrocortin or aldosterone. The detection of a patient with functioning adrenocortical tumor which secreted excessive amounts of aldosterone rounds out our knowledge of the syndromes of adrenocortical hyperfunction. Primary aldosteronism is characterized by hypertension, high-serum sodium, alkalosis, tetany, and low-serum potassium without edema.

Other syndromes of adrenocortical overactivity have long been known, such as Cushing's syndrome, due to excessive secretion of cortisone-like substances, and adrenal virilism, caused by oversecretion of male hormone-like substances. Removal of the aldosterone-secreting tumor is curative. All of these conditions are quite rare.

In addition to substitution for well-defined endocrine deficiencies, hormones have been used as nonspecific therapeutic agents in many conditions which cannot be considered true endocrine diseases. The best example of this nonspecific use of hormonal products is the use of cortisone in the treatment of rheumatoid arthritis and other similar conditions.

Growth Hormones.—Testosterone and its various esters are the most potent anabolic and growth-stimulating preparations known to medicine. At the present time there is still no potent pituitary growth hormone available to the practicing physician for the treatment of dwarfism. When used judiciously, androgens (testosterone-like steroids) can produce remarkable benefits in short-statured, undernourished boys who have retarded bone age and inadequate physical development. In the past there has been some hesitation on the part of the physician to use such steroids because of the theoretical possibility of producing premature cessation of growth and of

decreasing spermatogenesis. However, such fears have been dispelled by Dr. Gilbert Gordon of the University of California, and others, who have completed widespread research in this field. In the dosages commonly utilized for this type of clinical problem, no instances of premature growth cessation or sterility have been observed over a period of many years. Until the availability of a clinically practical pituitary growth hormone is accomplished, testosterone and its esters, as well as other androgenic steroids, will remain the most desirable anabolic agents in clinical medicine.

Mental Retardation.—Endocrinologists frequently see mentally retarded children in consultation because of the parents' hope that some glandular therapy will solve the problem. Occasionally among such children are found patients suffering from cretinism or severe juvenile myxedema. In such instances treatment with desiccated thyroid or other potent thyroid hormones frequently works a miraculous cure. However, in the vast majority of cases, mental retardation is due to a congenital defect or birth injury in the central nervous system, and glandular therapy is of no avail.

Crude desiccated thyroid extract from animal glands has long been the standard preparation for the treatment of hypothyroidism. However, recently synthetic sodium levo thyroxin has been found to be active when taken orally. This preparation has all the physiologic effects of the crude drug and in addition the advantages of accurate standardization. Tri-iodothyronine has also been found to have all of the physiologic effects of sodium L-thyroxin, but on a weight basis it is far more potent; the onset of action is more rapid, and the duration of effect is briefer. It is thought by some that sodium L-thyroxin is the thyroid hormone secreted by the thyroid gland, but that in the peripheral tissues it is modified to tri-iodothyronine which may be the peripherally active hormone.

New Hormone Preparations.—The ingenuity of the steroid biochemist and the experimental endocrinologist continues to keep the clinician supplied with new and increasingly potent and desirable preparations. It has been found that the unsaturation of a portion of the cortisone or hydrocortisone nucleus makes available a group of steroids which have many of the desirable effects of cortisone without some of the undesirable salt- and water-retaining effect. Also, milligram for milligram, these "delta" analogues, known as prednisone (Meticorten) and prednisolone (Meticortelone), are far more potent than the parent cortisone or hydrocortisone molecule. They find their main use in the treatment of rheumatoid arthritis, bronchial asthma, and other conditions for which cortisone or hydrocortisone were formerly employed.

Insulin, the hormone secreted by the islet cells of the pancreas, has been further modified by combination with metallic zinc to produce an intermediate-acting insulin known as Lente insulin. The action of Lente insulin is similar to that of NPH insulin, but has the advantage of no foreign proteins such as protamine or globin. The use of such an insulin preparation will be of most value in those patients who have proved to be allergic to some of these other long-acting insulin preparations.

17-alpha-hydroxyprogesterone-caproate, a long-acting progesterone preparation, will soon take its place among the many potent long-acting parenteral steroid hormone preparations. For-

merly, progesterone, when given in large doses, had a very short action and caused severe pain at the site of injection. A single injection of the new material, however, has a duration of two to three weeks and is virtually painless.

ROBERT F. SKEELS,
The Shelton Clinic, Los Angeles, Calif.

ENESCO (originally ENESCU), **Georges**, Rumanian violinist and composer: b. Dorohoi, Rumania, Aug. 19, 1881; d. Paris, May 4, 1955. Leader of the contemporary school of Rumanian composers, he was also regarded as one of the world's outstanding violinists.

Enesco began playing the violin at the age of four, and three years later was enrolled in the Vienna Conservatory, where in 1892 he won first prize for violin playing and harmony. In 1894 he entered the Paris Conservatory for further study and won another conservatory prize for his virtuosity with the violin. He also became proficient on the cello, organ, and piano. The successful production by Edouard Colonne in 1898 of Enesco's orchestral work, *Poème Roumain*, contributed to his reputation as a composer.

After leaving the conservatory in 1899, he toured as a violinist for a year, and for a short time performed as court violinist for Queen Elizabeth of Rumania. Subsequently he settled in Paris where, except for concert trips, he remained throughout the rest of his career, although he never applied for French citizenship. He made his debut in the United States on Jan. 2, 1923, as guest conductor of the Philadelphia Orchestra at Carnegie Hall, New York, and thereafter until the early 1950's made frequent trips to the United States, both to conduct and to play the violin.

Enesco was known particularly for the encouragement and aid he gave to promising young musicians, in connection with which in 1912 he established a prize for works by young Rumanian composers. About 1927, Enesco began his famous association with the brilliant young violinist, Yehudi Menuhin, and served as his musical mentor into the 1940's. Later, Enesco added formal teaching to his activities, and in 1948 he joined the faculty of the Mannes College of Music in New York, where he taught a rigorous course in the interpretation of chamber music.

As a composer, Enesco produced relatively few works, but he succeeded in developing an idiom that was peculiarly his own. His early work reveals influences of Wagner and Brahms, but with the composition of his opera, *Oedipe* (begun in 1921), which was performed at the Paris Opera in 1936, his music became basically Rumanian in character. He also composed two symphonies, three orchestral suites, three violin sonatas, songs, piano pieces, chamber music, and several orchestral works in smaller forms. His two *Rumanian Rhapsodies*, with melodies based on Rumanian folk music, and his *Symphonie Concertante* for cello and orchestra are his best-known musical works.

ENGLAND. See GREAT BRITAIN.

ENGLISH LITERATURE. During 1955, a number of new novelists clamored for deserved attention, admirable poetry came from the pens of older and younger writers, and the time proved ripe for an unusual number of attractive critical and autobiographical works. Only the drama seemed incapable of competing successfully with American and French imports, or with the dramatic offerings of radio and television.

Fiction.—Both experienced practitioners of fiction and novices published novels that deserved and won critical esteem. I. Compton-Burnett's *Mother and Son* displayed her familiar acerbity in its study of the destructive effects of a dominating woman on her husband and their middle-aged son. Aldous Huxley's short novel, *The Genius and the Goddess*, met with a mixed reception. Here, a middle-aged American physicist recalled his relations with an emotionally immature scientific genius, his wife, and their adolescent daughter. The narrator's affair with the "earth-Goddess" wife cured him of his priggish puritanism, but the suspicious and adoring daughter's resentment led to the seemingly accidental death of the mother and daughter. In *Homer's Daughter*, Robert Graves fictionalized ingeniously and robustly Samuel Butler's theory that the *Odyssey* was the work of a woman. Graves' choice was Nausicaä, and the novel gave a vivid account of the experiences out of which she was to fashion the great epic.

Of the novels by somewhat younger writers, Evelyn Waugh's *Officers and Gentlemen* was perhaps the most widely discussed. The sequel to *Men at Arms* gave the later stages in its hero Guy Crouchback's "long love affair with the army"—stages that carry him through Commando training in Scotland and a belated share in the disastrous Cretan expedition, to disillusionment with the officer whom he had most admired. Elizabeth Bowen's *A World of Love*, which found its plot in the effects on a closely related group of the discovery of the dead hero's love letters, proved to be a reworking in a curiously oblique style of two of her favorite themes: life in an Irish country house and a young girl's initiation into love.

Perhaps the most distinguished historical novel of 1955 was *Roman Wall*, by the Englishwoman who writes under the pseudonym of Winifred Bryher. Set in the 3d century A.D., the novel recreated persuasively the life of a town on the frontier of the Roman Empire, at the moment when it was threatened by the barbarous Alemanni. Less ambitiously, the veteran Ray C. Hutchinson told in *The Stepmother* of a gracious Canadian woman's attempt to cope with the memory of her husband's first wife and to save the son from the psychological damage his crippled mother had done him. Joyce Cary's *No Honour More* completed the trilogy begun with *Prisoner of Grace* and *Except the Lord*. The chief characters in the series are Nimmo, an unscrupulous politician, his divorced wife, and Jim Latter, earlier the father of her child, and now her husband. The novel, a *tour de force* of first-person narrative and characterization, ends in inevitable violence. *The Acceptance World*, the third volume in Anthony Powell's series, *The Music of Time*, continued the chronicle of the lives of young men making their devious ways on the periphery of society in the 1930's.

A number of younger novelists bid successfully for the attention and esteem of readers and critics in 1955. Chapman Mortimer's *Mediterraneo*, told of primitive revenge among gypsies and acrobats in a skillfully created Andalusian setting. *Drinkers of Darkness*, by the Irishman Gerald Hanley, portrayed with grim power the effect on a group of Europeans of the cultural strains and tensions of life in contemporary Africa. The popular theme of the anti-hero reappeared in several excellent novels. Percy H. Newby's *The Picnic at Sakkara* described the misadventures of a well-intentioned professor in the

bafflingly alien atmosphere of Egypt under King Faruk. The poet Dennis J. Enright's *Academic Year* told competently a similar tale of another academic bungler in a well-documented Alexandrian setting. Kingley Amis' *That Uncertain Feeling* traced amusingly the hapless adventures of a lower-class Welsh librarian in upper-class society. John Bayley's first novel, *In Another Country*, exposed his inexperienced hero to the inevitable complications of life in the army of occupation in Germany. Perhaps the most brilliantly inventive novel of the year was Nigel Dennis' *Cards of Identity*, a report on the fantastic case histories of members of the Identity Club, who had discovered the means to abnegate one's imperfectly possessed personality and to assume another's.

Drama.—A number of new plays warranted some attention in 1955. J. B. Priestley's *Mr. Kettle and Mrs. Moon* exhibited genially the revolt of a bank manager and the prim wife of a big estate agent against the restrictions of their conventional lives. Douglas Home's *The Reluctant Debutante* made comedy of the efforts of an unscrupulous and insensitive mother to launch her daughter socially.

Of the new playwrights, Dennis Cannan was represented by two effective comedies of manners in the Shavian manner. *Misery Me!* played intelligently with the relationship of a young intellectual bent on self-destruction and a glum young woman, beset by two lovers, a Communist and a capitalist, intent on each other's elimination. In *You and Your Wife*, he explored the comic possibilities of a young intellectual's espousal of the novel doctrine that bourgeois domesticity is the foundation of human happiness. Philip King offered two workmanlike plays. *Serious Charge* studied the effect on a young bachelor clergyman of the charge of homosexuality made by a defensive young spiv, but did not carry the theme through to its aesthetically logical conclusion. Less seriously, *Sailor Beware!* made fun out of the ancient farcical situation of a heavy-handed working-class mother's successful interference with a pair of young lovers' marriage plans.

The now-familiar subject of the plight of a nuclear physicist suspected of treason was treated in Norman King's first play, *The Shadow of Doubt*; its distinction lay in his creation of the scientist as a recognizable human being. The most eagerly awaited play of the year was *The Mulberry Bush*, the first dramatic effort of the esteemed writer of fiction, Angus Wilson. Although the play had the somewhat cluttered effect of a dramatized novel, it was redeemed by its fresh characterization of a family of reformers and their unsympathetic offspring, and by the sharpness and distinction of the dialogue. The most unusual play of the year was *Waiting for Godot*, by Samuel Beckett, an Irishman long resident in France. Out of the dialogue of four characters: two tramps, a callous master, and his slave, Beckett wrought a curiously disturbing and evocative philosophical discussion of the quest for some meaning in life.

Poetry.—The solidification of the achievements of certain poets who made their reputations in the 1920's or 1930's was indicated by the appearance of the *Collected Poems* of Robert Graves and Stephen Spender. Graves's prolific productivity as historical novelist and re-interpreter of myths has tended to obscure his distinction as an austere intellectual and witty, if stylistically crabbed, poet. Spender's volume proved to be not only a selection but also a sometimes unhappy revision of the poems to which he now

gives his critical approval. William Empson's *Collected Poems* confirmed the opinion that his poetry, no less than his criticism, is the product of one of the most original and subtle of contemporary minds. His deceptively simple conversational manner almost diffidently expresses a tough, complex, and individual life-view. The belated appearance of Hugh MacDiarmid's *In Memoriam James Joyce* betrayed the Joycean influence in its wide-ranging and challenging preoccupation with language rather than in its difficult, if powerful, philosophical passages. Robert Conquest's *Poems*, his first volume, represented the fastidious garnering of the work of two decades. His most successful poems explored sturdily the apparent inconsistencies between the poet's view of the world and that of the mid-20th century scientist.

Of poetry written by writers who first attracted attention during or since World War II, the most eagerly considered volumes were Lawrence Durrell's *The Tree of Idleness* and William S. Graham's *The Nightfishing*. These volumes, despite the diversity of their settings, were alike in their rich and precise sensory images and in their attempts to set forth these details within a framework of personal, if sometimes elusive, philosophy. Laurie Lee's *My Many-Coated Man* worked deftly in a light, almost rococo vein. Ronald Bottrall's *Adam Unparadised*, despite its stylistic indebtedness to Browning and Pound, struck an individual note of introspective and psychological subtlety. Clifford Dymont's *Experiences and Places* exploited with realistic fidelity his observations of life in the English midlands. In Kingley Amis' *A Frame of Mind*, an acute critical sense played over some of the more absurd aspects of contemporary culture. Martyn Skinner's *The Return of Arthur*, in a brilliant approximation of the manner of Byron's *Don Juan*, described the Orwellian plight of England in 1999 and recounted Arthur's unsuccessful attempt to restore it to chivalry and Christianity. Wilfred Watson's *Friday's Child* was the first significant manifestation of Dylan Thomas' influence on his younger contemporaries.

Criticism.—The critical productions of the year 1955 were far less impressive in quantity than in quality. The most widely ranging work of applied criticism was Sir Maurice Bowra's *Criticism and Inspiration*, which, after a reinterpretation of the classical doctrine of inspiration in modern psychological terms, gave fresh evidence of the writer's extraordinary linguistic equipment and critical insight in the treatment of such very diverse figures as Horace, Dante, Hölderlin, Pushkin, and Hardy.

The other noteworthy critical works suggested an intensification of interest in English 18th century figures. Peter Quennell's *Hogarth's Progress* discussed the painter as a depicter of dramatic narrative rather than pure artist. R. W. Ketton-Cremer's *Thomas Gray* renounced the task of solving the riddle of the poet's baffling personality in favor of a lively defense of his now unfashionable poetic achievement. Mrs. Lilian Had-dakin's *The Poetry of Crabbe* concerned itself with a close analysis and fresh evaluation of a limited but highly individual poet.

A. O. J. Cockshut's *Anthony Trollope* demonstrated by means of close critical analysis the presence in his author's later novels of powers not exhibited in the popular Barsetshire series. F. R. Leavis' overpolemical *D. H. Lawrence* proved valuable chiefly for its sympathetically revealing analyses of the major novels.

Biography and Autobiography.—Twenty years after the death of T. E. Lawrence, he became the subject of the most heatedly discussed autobiography and biography of the day. By the terms of his will, the publication of *The Mint*, his account of his experiences as an unidentified recruit in the Royal Air Force, became possible only in 1955. Its belated appearance aroused intense interest but, in the main, occasioned profound disappointment. Its style was frequently distinguished, if mannered; the effect of its content, however, was overwhelmingly monotonous, since, aside from his sharp sketches of sadistic officers and kindly but obscene-mouthed privates, it was a self-pitying record of physical discomforts and psychological distresses. Richard Aldington's *Lawrence of Arabia* was a detailed and, at times, unscrupulous defense of the position that Lawrence's fame as a war hero was undeserved—in fact, that it was consciously manufactured. Flora Armitage's *The Desert and the Stars* proved to be a far more judicious, if not definitive, biography of this still ambiguous figure.

Less controversial biographies concerned conspicuous late Victorian or Georgian figures. E. P. Thompson's *William Morris, Romantic to Revolutionary*, achieved a considerable success in its attempt to establish its subject's greatness as a man, if not as a poet or craftsman. John B. Morton's memoir of his friend, *Hilaire Belloc*, though perhaps naturally uncritical, wrought a living portrait of this variously gifted and vital eccentric. Lady Cynthia Asquith, in *Portrait of Barrie*, drew lovingly on her memories of her long and close association with him, but did not succeed in solving the riddle of his elusive personality or in explaining the exhaustion of his vein of fanciful creativity. Certainly the most adroit and diverting biography of the year was Anthony Glyn's tactful but sophisticated life of his grandmother, *Elinor Glyn*, the sensationally successful author of *Three Weeks*, and a fantastic, though shrewd, denizen of the vanished Edwardian era.

In the field of autobiography, the award for charm should unquestionably go to the poet Richard Church's account, in *Over the Bridge*, of his boyhood in "a small lower-middle-class household, at the slow end of the Victorian era," in Battersea. His astute portraits of his parents and his touching picture of his devotion to his gifted older brother prepare the way for his early discovery that poetry was to be his "weapon." *The Flowers of the Forest*, the second volume of David Garnett's autobiography, covered the years from 1914 to 1923, including his first success as a writer of limited but distinct gifts. C. S. Lewis' *Surprised by Joy* traced illuminatingly the experiences through which, in his boyhood and young manhood, he moved out of atheism into Christian faith. The first volume of John Lehmann's autobiography, *The Whispering Gallery*, combined an account of his boyhood and youth and literary reminiscences of the 1930's, in which, as editor of *New Writing*, he played a memorable part.

EPISCOPAL CHURCH. See PROTESTANT EPISCOPAL CHURCH.

ERITREA. An autonomous unit of Ethiopia, on the Red Sea coast of Africa. Estimated area, 47,900 square miles; pop. (est. 1953), 1,020,000. Asmara (est. pop. 90,000) is the capital; Mas-

sawa (27,000) and Assab (10,000) are ports. The population consists of Tigrinya-speaking Coptic Christians and Tigré-speaking nomadic Moslems in the north, Arabic-speaking Moslems along the coast, and Negro tribes in the southwest. There are also some 17,500 Italians.

An Italian colony prior to World War II, Eritrea was federated with Ethiopia in September 1952, in accordance with a United Nations decision of 1950. Eritrea has self-rule in local affairs; Ethiopia is responsible for defense, foreign affairs, currency, customs, communications, and trade. Eritrea has an elected 68-member Representative Assembly and a chief executive chosen by the assembly. On Aug. 8, 1955, Fitaurari Asfaha Woldemicael was named chief executive, replacing Dejasmatch Tedla, who resigned on July 29.

Barley, corn, wheat, coffee, tobacco, fruits, potatoes, and vegetables are grown in the uplands. The lowlands yield gum arabic, fibers, dates, and oil seeds. Flocks provide hides, meat, and dairy products. Industries include pottery, wines, bricks, matches, soap, glass, caustic soda, and paint. Chief minerals are salt (190,000 metric tons in 1953) and sulfur (2,500 in 1952). Railroads total 191 miles; motor vehicles, 3,405 (1954). In 1952 there were 2 daily newspapers with a total circulation of 6,000.

ESPIONAGE. See Index entry, *Subversive Activities*.

ESTONIA. An independent republic since 1918, Estonia was forcibly annexed by the USSR in 1940, and reannexed by force at the end of World War II as the Estonian Soviet Socialist Republic. The United States government does not recognize this annexation.

Area and Population.—Estonia's area is 17,370 square miles, and the population, 1,200,000 (est. 1954). Approximately 150,000 of the original Estonian population have been deported to the interior of the USSR, most of whom have been imprisoned in Arctic labor camps. These exiles have been replaced by Russians, Belorussians, and central Asians. Half the population of the Estonian capital, Tallinn, is now Russian. The USSR does not trust the native Estonians, and is slowly repopulating Estonia with other peoples deemed more loyal. Principal cities are Tallinn, 147,000 (est. 1944); Tartu, 60,100 (1938); and Parnu, 21,500 (1938). Principal religions (1939) are Lutheran, 78.2%, and Greek Orthodox, 19%.

Government.—Like other Soviet republics of the USSR, Estonia has its own legislative Soviet, and Council of Ministers (cabinet) with both executive and legislative powers. Of the 30 members of the Estonian cabinet, only one is a native-born Estonian, the remainder being either Russians, or Russified Estonians born and raised in the USSR. Even this cabinet, however, has virtually no autonomy, and functions mainly as a local agent for the execution of orders from the USSR central government. Today most Estonian laws are copies of USSR edicts, or laws of the Russian Soviet Republic. All key governmental posts are in the hands of the 31,000-man Estonian Communist Party, which is primarily an urban organization. Many of the party members are Russians. Of the 11-man bureau governing the party, only 2 are native Estonians. The others are Russians or Estonians from the USSR. All elections are single slate, with no candidates for office nominated except those approved by the Communist Party.

Economy.—In 1955, Estonian agriculture was about 98% collectivized, with 936 collective farms renting their large farm machinery from 69 state-owned machine-tractor stations. The average collective farm has 6,750 acres of land, and employs 145 families. There also are 80 state farms. Altogether, about 347,000 people work on both collective and state farms.

The chief agricultural occupation is dairy farming. Sale of livestock products accounts for 79% of Estonian collective farm income. Much of Estonia's meat, butter and eggs is now shipped to Leningrad. Because of peasant resistance to

collectivization, Estonian agriculture was declining in 1955. The milk production of collective farms was lower than in 1954; output costs on state farms remained high; and vegetable harvesting in the fall of 1955 was extremely slow.

Both heavy and light industries in Estonia have doubled in size since World War II. Oil-shale mining remained the chief industry in 1955, with most shale being converted into gas and piped to Leningrad and Tallinn. Shipbuilding and the manufacture of electrical machinery are other major industries, with the majority of their production being shipped to the remainder of the USSR. In general, Estonian industry today is a supply base either for Leningrad or for the Soviet Army and Baltic Fleet.

On Nov. 1, 1955, a new giant hydroelectric power station began operation on the Narva River, the power of which is used by both Estonian and Leningrad industries. All construction chiefs for the river dam and power station were Russian.

The 1955 planned budget provided for the total expenditure of 1,161,446,000 rubles (\$290,-361,500), of which 674,411,000 rubles were to be spent by the Estonian central government, and 487,035,000 rubles by city, town and rural district authorities. Of the tax revenues collected in Estonia during 1955, the major portion will not go to the Estonian government but will be taken by the USSR. Estonia will retain only 19.2% of its sales tax revenue, and 25% of its income tax receipts and machine-tractor station earnings.

It is estimated that the standard of living in Estonia today is about one third of the pre-World War II level, and roughly one eighth of the present living standard in the United States. The average Estonian worker earns from \$75 to \$150 per month (at the legal rate of exchange of 4 rubles to one dollar), yet he pays approximately \$4 for a pound of butter, and \$1.30 for a pound of sugar. A man's shirt costs about \$25; a pair of men's shoes, \$80; and a suit, \$350.

The USSR has built many launching platforms for guided missiles along the Estonian coasts, where there are also large concentrations of landing craft.

ELLSWORTH RAYMOND,
*USSR Area Specialist and Associate Professor
of Government, New York University.*

ETHIOPIA. An empire in eastern Africa. Area (including Eritrea, q.v., federated with Ethiopia in 1952), about 457,000 square miles; pop. (est. 1951), about 16 million. Chief cities: Addis Ababa, the capital (400,000); Asmara, capital of Eritrea (90,000); Dessie (36,000); and Dire-dawa (30,000). The Amhara, the ruling minority, live chiefly in the north. They are of Hamitic-Semitic origin and of the Coptic Christian faith. The Galla, forming about half the population, are of Hamitic descent and include Moslems, pagans, and a few Christians. Pastoral Danakil and Somali inhabit the east, and the Nilotic Bantus the southwest. There are some 40 languages and dialects, chief of which are Amharic (the official language), Galla, and Tigrinya.

Government.—Emperor Haile Selassie I (b. 1891) was crowned king in 1928 and emperor in 1930. On Nov. 4, 1955, the emperor promulgated a new constitution, replacing that of 1931. The constitution, 6 years in preparation, provides for universal suffrage for the first time in Ethiopian history. The lower house of the Ethiopian Parliament is to be popularly elected. The emperor, however, retains his imperial veto over legislation, the right to dissolve Parliament, and the power to appoint judges and cabinet ministers. The emperor may legislate by decree when Parliament is not in session, but

Parliament may abrogate such decrees. The constitution also provides for equal protection of the law for all citizens and guarantees freedom of speech and of the press. The Ethiopian Orthodox Church is established as the state church.

Education.—About 60,000 pupils attend government schools and an additional 55,000 attend Coptic Church schools. Addis Ababa has 6 secondary schools with about 2,450 students, 2 teacher-training schools, and a few technical, commercial, and handicraft schools. There is an agricultural college at Ambo.

Finance.—Official budget data are not published. For the fiscal year ended Sept. 9, 1954, unofficial estimates place revenue at Eth.\$106,340,000, and expenditure at Eth.\$99,994,461. The Ethiopian dollar equals U.S.\$0.4025. United States allotments of aid to Ethiopia in the period April 1948–March 1955 totaled U.S.\$8,612,000.

Production.—Despite the abundance of fertile land and resources, output is limited by primitive techniques and inadequate transport. Cereals production, chiefly durra and teff, approximates 1.4 million metric tons annually. Coffee, the chief export crop, was estimated at 680,000 bags (132.3 pounds each) in 1954–55 (prelim.). Pulses and oilseeds are produced both for export and home consumption. Sugarcane, tobacco, cotton, and plantains are grown on a small scale. Meat and dairy products, hides, and skins are yielded by the large herds of cattle, sheep, and goats. Salt, gold, and platinum are the chief minerals exploited. In 1953 there were 123 manufacturing establishments employing 10 or more workers; wage earners numbered 9,700; and gross value of output totaled Eth.\$37.2 million. Over half the industrial output was accounted for by textile plants, oil and soap factories, and tobacco and cement plants.

Foreign Trade.—For the year ended Sept. 9, 1954, exports totaled Eth.\$174,622,688; imports Eth.\$155,176,409. Coffee constituted 65.2% of the value of exports. Other exports included cereals and pulses, oilseeds, and hides and skins. Chief imports are cotton textiles, petroleum products, motor vehicles, sugar, and other foodstuffs and manufactures. The United States, Ethiopia's chief customer, took 31.8% of exports and provided 13.9% of imports.

Transportation and Communications.—A French company operates the 487-mile railway from Addis Ababa to Djibouti, French Somaliland; 421 miles of the line is in Ethiopia. The only other railway is a 191-mile line in Eritrea. There are some 3,000 miles of primary and 4,000 of secondary roads. The 1951–54 highway program, undertaken with United States aid, involved improvement of some 2,050 miles of roads at an expenditure of Eth.\$42 million. (See also HIGHWAYS.) The government-owned Ethiopian Airlines is operated under a management contract by Trans-World Airlines. Motor vehicles in 1954 numbered 15,437; telephones, 5,825.

Principal Events, 1955.—Celebration of the 25th anniversary of Emperor Haile Selassie's accession to the throne took place in Addis Ababa, November 2–3. The emperor promulgated a new constitution on November 4, providing for universal suffrage and a popularly elected lower house of Parliament. The new constitution guaranteed freedom of speech and of the press and other democratic liberties. The emperor also announced that the nation's civil, penal, commercial, and maritime laws had been codified.

To honor the emperor, a Silver Jubilee Fair was held in the capital, November 5–December 4. It was hoped that the fair would stimulate business, which had been suffering a decline since late 1954 due to the fall in world coffee prices. The Export-Import Bank of Washington on October 3 announced a \$24 million credit to

Ethiopia for the purchase of commercial aircraft and the development of commercial aviation facilities.

ETHNOLOGY. See Index entry, *Anthropology*.

EUROPE. United Nations estimates place the area of Europe (exclusive of USSR and European Turkey) at 1,903,500 square miles, and the mid-1954 population (exclusive of USSR) at 406,500,000. (See separate articles on individual countries, and the Index entry, *Europe*.)

EUROPE, Council of. See COUNCIL OF EUROPE.

EUROPEAN COAL AND STEEL COMMUNITY. Organized in 1952 to provide a free trade area for the coal and steel industries of Belgium, France, the German Federal Republic, Italy, Luxembourg, and the Netherlands, the ECSC has become one of the most important international cooperative organizations. (For the organization of the ECSC, see EUROPEAN ORGANIZATIONS.)

Production.—Community coal production in 1954 amounted to 241,600,000 metric tons, an increase of 2% over 1953, and the highest total since World War II. Steel production reached 43,700,000 metric tons, an increase of 10% over 1953 and 4.6% over 1952, the previous record year.

Loans.—In order to develop production facilities, loans are made by the High Authority to various individual enterprises in member countries for 25-year periods at an interest rate of 4.1%. In April 1954 the United States granted a loan of \$100 million to the High Authority through the Export-Import Bank of Washington. This loan, running for 25 years with an interest rate of 3½%, had been allocated by the end of June 1955 to 54 firms, as follows: thermal power stations, \$46,570,000; colliery installations, \$30,980,000; iron ore mines, \$18,750,000; and cokerries, \$3,700,000. Although the American and the High Authority's loans covered only 20% to 30% of any given investment, their low rates of interest forced loans from other sources (\$350–\$400 million) to carry lower than normal interest rates.

Taxes and Subsidies.—In order to supply various established funds with capital, the High Authority levies taxes on the coal and steel produced within the community. Because the funds had reached a satisfactory level, the High Authority reduced the 0.9% tax to 0.7% on July 1, 1955, and to 0.45% on Jan. 1, 1956.

The High Authority has ended subsidies for an estimated 25% of Belgian coal production. Production of anthracite coal will no longer be subsidized, and the High Authority and the Belgian government have decided that three mines in the Campine region can already meet the competition of other areas.

Principal Events, 1955.—Although tariffs, quotas, and currency restrictions were removed within the community by the establishment of common markets for coal and iron ore (Feb. 10, 1953), scrap iron (March 1, 1953), standard steels (May 1, 1953), and special steels (Aug. 1, 1954), subsidies to part of the industry, differences in tax structure and social insurance policies, cartel restrictions, and varying railway rates remain. It was not until Jan. 20, 1955, that the Council of Ministers undertook to solve the problem of railway transport (multiple terminal taxes at international borders within the community).

On May 1, 1955, multiple (split) tariffs on coal and iron ore were ended and two thirds of the excess terminal charges were cut; the remain-

ing one third were to end a year later. On May 1, 1956, similar treatment was to be accorded steel and scrap, with the remaining one third excess terminal charges to end on May 1, 1957. Despite these improvements, much still remains to be done to harmonize national transport companies so that they do not hinder the growth of a genuine single market.

On Dec. 21, 1954, the ECSC's Court of Justice upheld a French appeal and ruled that the High Authority cannot permit deviations from published list prices. In line with this decision the High Authority requested all steel companies to publish, beginning Jan. 24, 1955, their actual prices and all future price changes. In February the community resorted to sanctions for the first time and imposed fines on two firms, one Belgian and one Italian, for refusing to adhere to the policy of published prices.

The Common Assembly met at Strasbourg, France, on May 10-14, 1955, for its annual regular session, and passed resolutions calling on the Special Council of Ministers to further the integration of Europe in line with the Benelux suggestions to enlarge the community's powers in the economic field. Changes were suggested, especially in transport, electricity and gas production, and atomic energy, and toward the gradual extension of free trade to products other than coal and steel, and the progressive harmonization of the social legislation of the member states.

Meeting at Messina, Sicily, from June 1 to 3, 1955, the Council of Ministers decided to appoint a committee of national representatives to study the problems raised by the Benelux proposals. The committee, including representatives from Great Britain (which became associated with the community on Dec. 21, 1953), began their meetings in July. On September 6 it was announced that progress had been made toward integrating transport, nuclear energy, and power and fuel, as well as toward establishing a common market.

At the Messina meeting the Council of Ministers nominated René Mayer, a former French premier, to succeed Jean Monnet as chairman of the High Authority.

EUROPEAN ORGANIZATIONS. The following major organizations are designed to achieve collective action among member nations in the military, economic, and other spheres.¹

North Atlantic Treaty Organization (NATO).—Treaty signed by 12 states in Washington, April 4, 1949. Membership (1955), 15 states: United States, United Kingdom, France, Italy, Belgium, Canada, Denmark, Iceland, Luxembourg, Netherlands, Norway, Portugal, Greece (since 1952), Turkey (since 1952), and the German Federal Republic (since 1955). Chief organs (1955):

I. North Atlantic Council (15 states); headquarters, Paris

II. Military Committee (13)²

A. Military Representatives Committee (13)²; headquarters, Washington

B. Standing Group (3); headquarters, Washington

1. NATO Supreme Commands:

a. European Command: Supreme Headquarters, Allied Powers, Europe (SHAPE); Supreme Allied Commander, Europe (SACEUR); headquarters, Rocquencourt (near Paris)

b. Atlantic Ocean Command: Supreme Allied Commander, Atlantic (SACLANT); headquarters, Norfolk, Va.

c. Channel Command: Allied Commander in Chief, Channel and Southern North Sea

¹ Articles on NATO, WEU, ECSC, and Council of Europe will be found under their own headings.

² Iceland has no military representative, and Luxembourg is represented by Belgium.

(CINCCAN); headquarters, Portsmouth, England; and Allied Maritime Air Commander in Chief, Channel and Southern North Sea (CINCMARCHAN); headquarters, Northwood, England

2. Canada-United States Regional Planning Group; headquarters, Washington

3. Channel Committee (4); headquarters, London

4. NATO Defense College

5. Military Agency for Standardization (MAS)

6. European Military Communications Coordinating Committee (EMCCC)

7. Advisory Group on Aeronautical Research and Development (AGARD)

8. Air Training Advisory Group (ATAG)

III. International Staff/Secretariat; headquarters, Paris

(For a more detailed outline of NATO's structure, see North Atlantic Treaty Organization.)

Organization for European Economic Cooperation (OEEC).—Convention signed in Paris, April 16, 1948. Some functions have been transferred to NATO agencies. Membership (1955), 17 states: NATO members (except United States and Canada) plus Austria, Ireland, Sweden, and Switzerland. Headquarters: Paris. Chief organs:

(1) Council (17)

(2) Executive Committee (7)

(3) Secretariat

Western European Union (WEU).—Based on the former Brussels Treaty Organization created under the Brussels Treaty, signed on March 17, 1948, by the United Kingdom, France, Belgium, the Netherlands, and Luxembourg. On May 5, 1955, protocols signed in Paris on Oct. 23, 1954, came into force, transforming the Brussels Treaty Organization into WEU, with the German Federal Republic and Italy as additional members. Chief organs (1955):

(1) Council (7)

(2) Assembly (representatives of WEU nations in the Consultative Assembly of the Council of Europe)

(3) Civilian secretariat; headquarters, London

Council of Europe.—Statute signed in London, May 5, 1949. Purpose: to promote, through recommendation, the development of European unity. Membership (1955), 14 states plus the Saar (associate member): NATO states (except United States and Canada) plus Sweden. Headquarters: Strasbourg, France. Chief organs:

(1) Committee of Ministers (14)

(2) Consultative Assembly (132)

European Coal and Steel Community (ECSC).—Treaty signed in Paris, April 18, 1951 (entered into force July 25, 1952). Purpose: to establish a free trade area for the coal and steel industries of member nations. Membership, 6 states: France, German Federal Republic, Italy, Belgium, Netherlands, and Luxembourg. Headquarters: Luxembourg (city). Chief organs:

(1) High Authority (9)

(2) Special Council of Ministers (6)

(3) Consultative Committee (30-51)

(4) Common Assembly (78)

(5) Court of Justice (7)

EUROPEAN PAYMENTS UNION. An arrangement for multilateral exchange and transferability of currencies, established by members of the Organization for European Economic Cooperation (OEEC) with United States aid, to facilitate trade between member nations pending full convertibility. The EPU became effective on July 1, 1950, and was to expire on June 30, 1952. By

decisions of the OEEC Council, however, the life of EPU has been extended each year. EPU operations are supervised by a 7-member managing board nominated by the OEEC Council.

Operations of the EPU are as follows: (1) At the end of each month each member reports the bilateral end-of-month balances of its monetary area with other members and their monetary areas to the agent (Bank for International Settlements), which establishes a net surplus or deficit for each member. (2) These net surpluses or deficits are settled 75% in gold payments and 25% in credit extended to or by the EPU. Maximum limits (shown in the table) have been established, to which any member's claim on EPU, or its debt to EPU, can rise. (3) Deficits falling outside the established limits are settled fully in gold, and surpluses are settled in accordance with *ad hoc* arrangements between EPU and the country concerned.

* After mid-November settlements. (Source: International Monetary Fund.)

The chief problems considered by the OEEC Council in its meetings of Jan. 13-14, 1955, and June 9-10, 1955, involved the movement toward convertibility and arrangements to aid in the adjustment thereto. At its June meeting, the OEEC Council decided that the EPU would be continued to June 30, 1956, but could be terminated at any time before then if desired by member countries whose quotas amounted to at least half the total. Beginning with August 1955, settlements would be made on a basis of 75% gold and 25% credit, as compared with 50% gold and 50% credit in the period July 1954-July 1955. As soon as EPU came to an end, a European Monetary Agreement would come into operation, administered by a managing board similar to that of EPU. The European Monetary Agreement would consist of two interrelated structures, a European Fund and a Multilateral Clearing System. The European Fund would provide short-term credit to member countries whose balance-of-payments situation required it. Capital of the fund would be \$600 million (\$271,575,000 from the residue of EPU capital and \$328,425,000 in contributions from member countries). The Multilateral Clearing System would ensure that, under conditions of convertibility, any member country could obtain temporary financial accommodation. If the EPU had not been terminated by March 31, 1956, the OEEC would review the

conditions on which EPU might be renewed after July 1, 1956, and would also review the provisions of the European Monetary Agreement.

EUROPEAN UNION. See WESTERN EUROPEAN UNION.

EVENTS OF THE YEAR. See the CHRONOLOGY at the front of this volume.

EXCHANGE RATES. Exchange rate developments in the 12 months ending Oct. 31, 1955, are summarized below.

Bolivia.—The par value agreed with the International Monetary Fund (IMF) remained nominally at 190 bolivianos per U.S. dollar. Since mid-1954, no exchange rate is directly applicable to exports because these are made by or through government agencies. Imports are made at the 190 rate, but are subject to varying surcharges so that effective rates range up to 15 times the 190 rate. In the free market, confined to invisibles, the boliviano depreciated from about 1,900 to 3,000 bolivianos per dollar from December 1954 to September 1955.

Brazil.—Brazil continued its complex system of multiple rates. Export rates, which are administratively determined, were depreciated in all categories and for all currencies at the beginning of 1955. Since then additional effective depreciation has occurred by shifting many categories of goods to more depreciated rates. Import transactions continued to take place at both nonfluctuating rates for favored goods and at fluctuating and considerably more depreciated rates for all other goods. Most nonfluctuating rates were substantially depreciated during the year, but still remain at levels several times more favorable than the fluctuating rates. These latter vary according to the goods imported and the currency used in payment. As of September 1955, effective export rates ranged from 36 to 50 cruzeiros per U.S. dollar, and import rates from about 19 to 425 cruzeiros.

Chile.—During 1955 the Chilean peso continued to depreciate. Whereas at the end of 1954 the principal rate for both exports and imports was 200 pesos per U.S. dollar with a number of "essential" imports made at a rate of 110, by the fall of 1955 the principal rate had depreciated to 300. The 110 and 200 rates remain in effect but have considerably less application. The free rate, used primarily for invisibles, depreciated from 315 to 750 pesos per U.S. dollar from December 1954 to September 1955.

Colombia.—In February 1955, Colombia eliminated the differential rate that had been in effect for coffee exports, thereby making the rate of 2.50 pesos per U.S. dollar applicable to practically all trade transactions. In April 1955, however, a number of minor exports and a substantial volume of imports (so called less-essentials) were shifted from the 2.50 rate to the free market. For these transactions, the rate as of October 31 approximated 4.00 pesos per U.S. dollar.

Iran.—Iran continued its policy of gradual appreciation. Buying and selling rates as of Oct. 31, 1955, were 75 and 76.5 rials per U.S. dollar. In December 1954, rates were 78 and 82 buying and 84.5 selling. In February 1955 the buying rate in effect as of October 31 was established and the effective import rate was changed to 79.50. In August 1955 the import rate was further changed to the October 31 level.

Indonesia.—In September 1955, Indonesia abolished the structure of tax rates on imports and established two fixed rates—17.21 and 22.95 rupiah per U.S. dollar for most imports. Auction

rates (quotations not yet available) were established for luxury imports. The export rate continued unchanged throughout the period at 11.36 rupiah per U.S. dollar.

Nicaragua and Pakistan.—These countries agreed with the IMF on changes in par value from 5.00 to 7.00 and from 3.309 to 4.762 cordobas and rupees, respectively, per U.S. dollar on July 1 and July 31, 1955. In Nicaragua, at the same time, effective import rates of 8 and 10 cordobas were discontinued. Otherwise the systems remained unchanged.

Paraguay.—Effective rates as of Oct. 31, 1955, ranged from 15 to 49 guaranies per U.S. dollar for exports, and from 21 to 75 guaranies for imports. Although during the past year there

¹ Par value not yet established. ² On Sept. 30, 1950, Canada introduced an exchange system under which the exchange value of the Canadian dollar is allowed to fluctuate so that exchange transactions in Canada are not necessarily based on the par value of 1.100 Canadian dollars per U.S. dollar established on Sept. 19, 1949. ³ No par value agreed with the IMF since Jan. 26, 1948. ⁴ In November 1949, Peru introduced an exchange system under which the par value of 6.50 soles per U.S. dollar agreed on Dec. 18, 1946, applies to no transactions. No new par value has been proposed.

has been little change in the range of existing rates, a number of new rates within this range and representing substantial depreciation for various transactions were established.

Thailand.—In the year 1955, Thailand made the free rate applicable to all exchange transactions by first, at the beginning of 1955, making the free rate partially applicable to rice export proceeds, and by later (in August and September 1955) making the free rate totally applicable to rice, tin, and rubber export proceeds. The free rate had already applied to all other transactions.

In October 1955, the Canadian dollar, which throughout the earlier part of 1955 was at a slight premium over the U.S. dollar, fell to par. In other countries employing free rates for all or a large portion of exchange transactions (Lebanon, Peru, Switzerland, and Syria) rates remained relatively stable throughout the year.*

EXPLOSIONS. See Index entry.

EXPORT-IMPORT BANK OF WASHINGTON. The basic purpose of the bank is to facilitate and assist in the financing of both the export and import trade of the United States.

Public Law 570, 83d Congress, 2d Session, 68 Stat. 677, amending the Export-Import Bank Act of 1945, became effective on Oct. 11, 1954, when Glen E. Edgerton, president, Lynn U. Stambaugh, first vice president, and Hawthorne Arey, director, entered office. Vance Brand and George A. Blowers were subsequently appointed directors to complete the five-man bipartisan Board of Directors. In July 1955 the bank announced appointment of its nine-man Advisory Committee, which is broadly representative of production, commerce, finance, agriculture, and labor. Roy C. Ingersoll was designated chairman. The Advisory Committee will meet at least once a year to consult with the bank on its program. Following the resignation of Glen E. Edgerton, Samuel C. Waugh was appointed president of the bank on Oct. 4, 1955.

The year ended Aug. 31, 1955, witnessed a continuing uptrend in the lending activities of the bank. New applications were received at a rate over three times the previous three-year average, and the number of credits authorized during the first half of the calendar year 1955 was larger than for any previous six-month period since the bank was established. The bank has continued its practice of assisting exporters in financing specific transactions on a case-by-case basis. In addition, it has undertaken, in appropriate cases, to establish credit lines for exporters under the terms of which they are appraised in advance, in fairly specific terms, as to how far the bank may be willing to go in financing their exports to specific countries. In the year ended Aug. 31, 1955, the bank had authorized 108 exporter credit lines in a total amount of \$152,-970,000.

Although most requests for assistance in 1954-55 originated with United States suppliers, the bank continued to receive and, in appropriate

* For a more detailed account of exchange rate changes during the year, and for current information on exchange rates and exchange control systems in general, consult *International Financial Statistics*, published monthly by the International Monetary Fund.

cases, to approve requests of foreign entities and governments for credits to finance the acquisition of United States materials, equipment, and services for developmental projects to be undertaken abroad.

The cumulative total of credit authorizations as of Aug. 31, 1955, was \$7.3 billion. Total loans outstanding amounted to \$2.6 billion, and the unutilized portion of established active credits was \$810.7 million. Total earned surplus amounted to \$367.1 million. A dividend of \$22.5

million on the bank's capital stock of \$1 billion was paid to the treasurer of the United States at the end of the fiscal year 1955.

EDWARD S. CONGER,
Assistant Secretary.

FAROE (or FAROE) ISLANDS. A group of 21 islands (18 inhabited) in the North Atlantic between the Shetland Islands and Iceland. Area, 540 square miles; pop. (est. 1954), 33,000. The capital and chief city is Thorshavn (4,390). The islanders exercise home rule and send two representatives to the Danish Folketing. Sheep raising and fishing are the chief occupations. On April 21, 1955, the villagers of Klaksvig, on Bordö Island, violently opposed an order of the Danish government removing a local physician accused of collaboration with the Nazis in World War II. Minor outbreaks again took place in September and November, and 14 Klaksvig men were placed on trial for violence and rebellion.

FAIRS AND EXHIBITIONS. The following article reviews major developments of 1955 in two sections: (1) Agricultural Fairs; and (2) International Trade Fairs. For references to related subjects, see the Index entry, *Shows*.

AGRICULTURAL FAIRS

The fear that state and county fairs and provincial exhibitions would wane in popularity because of competition from various forms of commercial entertainment evidently was groundless. During 1955 the fairs of the United States and Canada had a most successful season, except in a few localities. Record and near-record attendance marks were registered by most of the larger fairs, and the smaller county events had a prosperous season.

Improvement of fair properties has continued on a large scale. The Oklahoma State Fair (Tulsa) has received approval of a bond issue for \$2.1 million in plant improvements, including an exhibit building to cost \$870,000. The Red River Exhibition (Winnipeg) has a new \$2 million arena. The Canadian National Exhibition (Toronto) is at work on a new \$3 million women's building. The York, Pa., Interstate Fair added a new coliseum in 1955. These are only a few examples of improvements being made at leading fair grounds.

Four widely separated major fairs still hold the records for attendance. Topping all in 1955 was the Canadian National Exhibition (Toronto) with an attendance of 2,809,500, only slightly under that of 1954. Ranking second was the Texas State Fair (Dallas) with over 2,000,000; third, the Los Angeles County Fair (Pomona, Calif.) with 1,021,909; and fourth, the Minnesota State Fair (St. Paul) which set a new record of 1,008,101.

With few exceptions, fairs throughout the

United States had attendance marks close to or above those of previous years. One exception was the Wisconsin State Fair (Milwaukee), which was hard hit because of a polio epidemic. Among the larger attendance marks were: the Illinois State Fair (Springfield), 950,000; Michigan State Fair (Detroit), 786,758; California State Fair (Sacramento), 752,303; Indiana State Fair (Indianapolis), 590,000; Missouri State Fair (Sedalia), 542,175; Iowa State Fair (Des Moines), 505,000; Ohio State Fair (Columbus), 505,000; Virginia State Fair (Richmond), 399,330; New Jersey State Fair (Trenton), 400,000; New Mexico State Fair (Albuquerque), 365,000; and Colorado State Fair (Pueblo), 240,000.

Large district fair attendance marks included: Reading, Pa., 240,819; Spencer, Iowa, 175,000; Owatonna, Minn., over 150,000; Southern California Exposition (Del Mar), 244,567; and Davenport, Iowa, 82,783.

In Canada, the Pacific National Exhibition (Vancouver, B.C.) drew an attendance of 750,792; the Central Canadian National Exhibition (Ottawa), 431,197; the Exposition Provinciale (Quebec), 360,000; the Provincial Jubilee Exhibition (Regina, Sask.), 203,342; and the Greater Winnipeg Exhibition (Winnipeg, Man.), 150,000. The exhibition at Brandon, Man., topped its 1954 mark, while that at Edmonton, Alta., showed reduced attendance because of rain and excessive heat.

Chicago Representative, "Radio-Television Daily"; Former Manager, Chicago Office, Ringling Bros.-Barnum & Bailey Combined Shows, Inc.

INTERNATIONAL TRADE FAIRS

The more important developments in international trade fairs in 1955 were: the greater interest displayed in this form of trade promotion by several countries of the Far East; the continuing development of the international vertical or industry exhibit; and the greatly increased United States participation in trade fairs throughout the world.

Twenty-three international trade fairs were scheduled to open their doors in the Far East in 1955. The increasing reliance of the Far East on this means of trade promotion reflects the desire of the countries of this region to develop their international trade as well as their confidence in the effectiveness of this institution as a business producer.

Vertical, or industry, exhibits increased in both size and number during 1955, reflecting the

emergence of new industries and products in that year of world economic expansion, as well as the growing popularity of those international exhibits where the products of but a single, or a related group, of industries were offered for sale.

In 1955 the United States greatly expanded its international trade fair participation program. This program, administered by the Department of Commerce, consists of two closely integrated parts: the central government-industry exhibits, and the trade fair missions.

The United States central government-industry exhibits emphasize some theme describing American life under the free enterprise system, American industry's production for peace, or how America's science and industry can help raise standards of living. Products of American industry, loaned or given to the government, and which serve to underline the exhibit theme or the product emphasis of the fair itself, are on display at the central exhibit.

The trade fair missions, composed of Department of Commerce specialists and businessmen selected for each fair on the basis of their specialized competence, staff trade information centers at those fairs selected for United States participation. Each trade information center is a small "field office" of the Department of Commerce and an extension of the commercial services of the United States embassy in the fair country, where visitors to the fair can come for information on doing business with United States firms and to request the services offered by the Department of Commerce to help in promoting trade.

Government activities in exhibiting are intended to strengthen and support displays by private business which, for many years, has participated in international fairs. In 1955 the relationship between the two types of exhibits was made clear to all observers by a symbol—the head of the Statue of Liberty done in gray on a red, white, and blue background.

By the end of 1955, the United States government had participated in 24 international trade fairs held in Bangkok (December 1954), Frankfurt, Milan, Lyons, Brussels, Hannover, London, Tokyo, Paris, Palermo, Toronto, Barcelona, Djakarta (Indonesia), Stockholm, Karachi, Salonika, Bari, Vienna, Berlin, New Delhi, Addis Ababa (Ethiopia), Bogotá (Colombia), Ciudad Trujillo (Dominican Republic), and Phnom Penh (Cambodia). At three of these—Lyons, London, and Toronto, the government had only a trade information center; and at one, Phnom Penh, a central exhibit only.

U.S. Department of Commerce.*

FALKLAND ISLANDS. The principal among some 200 islands comprising this British crown colony in the South Atlantic Ocean (area, exclusive of dependencies, 4,618 square miles; pop., 2,212 in 1954) are East Falkland (2,580 square miles), on which is Stanley, the capital (pop., 1,135), and West Falkland (with adjacent small islands, 2,038 square miles), lying some 300 miles east of the Straits of Magellan.

Most important of five dependencies is South Georgia (area, 1,450 square miles; pop., 1,500 in the whaling season); the others, scattered southeastward to the Arctic, are the South Shetlands (1,800 square miles); South Orkneys (240 square miles); South Sandwich (130 square miles); and Graham Land, the last forming part of the Antarctic continent (known by the United States

as the Palmer Peninsula). The colony's population is almost entirely of British stock.

A governor (Oswald Raynor Arthur, assumed office April 1, 1954) is assisted by a 7-member Executive Council (including 3 nonofficials) and an 11-member Legislative Council, the latter having a nonofficial majority of one. Revenue in 1954 totaled £241,741; expenditure, £221,931. Education is compulsory. A government school in Stanley had about 180 pupils in 1954; in addition, 7 settlement schools, with 10 traveling teachers, were maintained in the country districts.

Sheep raising is the colony's principal industry (599,905 sheep raised on 2,875,520 acres in 1953-54). Exports in 1954 were valued at £506,163 (wool, £453,300; hides and skins, £34,553; tallow, £1,975; casings, £560; frozen meats, £15,775); and imports, £484,545. Aggregate exports (Falkland Islands and dependencies), including whale oil production at South Georgia, were valued at £5,882,660 in 1954; imports, £3,172,912. The colony has an internal government air service. Interisland transport is maintained by a government motor vessel, 3 privately owned coasters, and a ship of the Falkland Islands Company; the latter also conveys passengers and mails to South America.

By May 1955, British bases in the Antarctic numbered 16, including 6 in Graham Land reoccupied in 1954. In the course of expeditions by the Falkland Islands Dependencies Survey, a new base was surveyed and occupied in 1955 at Anvers Island in the South Shetlands, and another at Horseshoe Island on Marguerite Bay, about 150 miles south of the Antarctic Circle—the latter the most southerly point claimed by Great Britain. Parts of the area are claimed also by both Chile and Argentina. The latter government sent a large-scale expedition to the Antarctic in 1955, and announced on January 17 that a scientific base (the southernmost of several Argentinian bases set up in recent years) had been established on the shore of the Weddell Sea, 800 miles from the South Pole, apparently near the site of the Vahsel Bay base for the British Commonwealth 1956-57 transpolar expedition.

Argentina and Chile renewed in November 1954 their annual agreement with Great Britain to exclude gunboats south of latitude 60° during the Antarctic summer, but in 1955 both governments rejected a British offer to submit the conflicting claims of Antarctic sovereignty to arbitration. Accordingly the United Kingdom government in May 1955 submitted the disputes to the International Court of Justice, to which documents were presented supporting the British claim of title to the Falkland Islands dependencies, based on historical discoveries dating from 1675 to 1843, and on "a long record of effective occupation." FAMILY DATA. See Index entry, *Families*.

FARM CREDIT SYSTEM. Farmers and their marketing, purchasing, and service cooperatives in the year ended June 30, 1955, borrowed \$2.4 billion from the Farm Credit System, which is supervised by the Farm Credit Administration. This all-time high was \$218 million, or 10% more than in the previous year.

The Farm Credit System includes 1,100 national farm loan associations, 498 production credit associations, 12 land banks, 12 production credit corporations, 13 banks for cooperatives, and 12 intermediate credit banks. Each of the 12 Farm Credit District organizations includes a land bank, a production credit corporation, an intermediate credit bank, and a bank for cooperatives. The Central Bank for Cooperatives is located in Washington, D.C.

On June 30, 1955, farmers and their cooperatives owned capital stock of \$198 million in the system, an increase of \$11 million in the year.

Funds to make loans are obtained primarily by selling bonds and debentures in investment

markets. As of June 30, 1955, \$1.1 billion in land bank bonds was outstanding; \$793 million in intermediate credit bank debentures; and \$110 million in debentures of the 13 banks for cooperatives.

Farmers obtained 57,000 farm mortgage land bank loans for \$403 million through their 1,100 national farm loan associations in the fiscal year 1955. This was 34%, or \$101 million, more than in the previous year. At the end of the 1955 fiscal year, farmers had 351,000 land bank loans outstanding for \$1.4 billion, the largest amount since 1943, and 13% more than a year earlier. Farmers paid \$178 million on their land bank loans: \$102 million in matured principal and interest, and \$76 million ahead of schedule. Farmers also cut the cost of their farm mortgage credit by \$3.7 million, the amount returned in dividends on the stock they own in their local national farm loan associations.

Farmers obtained 272,000 operating credit loans for \$1.3 billion from their 498 production credit associations. While the number of loans increased only slightly, the amount was up 8%.

Farmer-members of 121 associations received \$792,000 in dividends, compared with \$592,000 paid by 86 associations in the 1954 fiscal year. Farmer-members of 30 of the dividend-paying associations also received \$418,000 in patronage refunds.

Farmer ownership of production credit associations reached a new high, with 419 of the 498 associations completely member-owned on June 30, 1955, compared with 354 a year earlier.

More farmers' cooperatives were using the 13 banks for cooperatives on June 30, 1955, than at any time in the banks' 22 years of operations. The 2,129 borrowing farmers' marketing, purchasing, and service cooperatives had loans outstanding of \$317 million, up 4% from the previous year. Of the \$500 million that cooperatives borrowed in the year, \$315 million was for operating capital, \$131 million for commodity loans, and \$54 million for facilities. Operating capital loans increased 13% and facility loans were up 9%, but commodity loans declined 19%.

The 12 federal intermediate credit banks providing funds for lending institutions made loans and discounts of \$1.9 billion. Of this total, 87% was for production credit associations and provided the bulk of their lending funds, 8% was for other financing institutions, 4% was for the 13 banks for cooperatives, and less than one half of 1% was for farmers' cooperatives.

R. C. ENGBERG,

*Chief, Research and Information Division,
Farm Credit Administration.*

FARM STATISTICS. See Index entry, *Farm*.

FARMERS HOME ADMINISTRATION. Loans made and insured by the Farmers Home Administration in the fiscal year 1955 reached \$293,190,000, the highest figure in the agency's history.

The insured farm loan program was greatly expanded during 1954-55. A soil and water conservation loan program was introduced about Oct. 1, 1954, to provide for soil conservation, water development (conservation and use), and drainage. Accordingly, loans were introduced for such improvements as construction and repair of terraces, ponds, waterways and erosion control structures, and ditches and canals for irrigation and drainage. Sodding, subsoiling, pasture improvement, brush removal, land leveling, tree planting, well drilling, and the purchase of pumps, sprinkler systems, and other irrigation

equipment may be financed through soil and water conservation loans. Such loans totaled \$19,491,000, of which \$15,469,000 was insured.

Private lenders provide the funds for insured loans, and the FHA makes and services the loans, and guarantees repayment. The volume of insured loans rose from \$9,500,000 in 1954 to \$47,402,000 in 1955, owing to increased participation by lenders and the use of insured loans in financing soil and water conservation.

During the 1955 fiscal year, approximately 135,000 loans were made to farm families, compared with 131,000 in 1954. Including farmers who already had loans, some 248,000 families worked their farms with Farmers Home Administration credit during 1955.

Production and subsistence loans to operators of family-type farms for the purchase of farm equipment, livestock, fertilizer, seed, and for other expenses totaled \$133,592,000. With these funds, owners and operators were enabled to develop balanced farming systems and make full use of their resources. Approximately 75% of the funds was invested in farm equipment, livestock, and other capital improvements.

Farm ownership loans for the purchase of and development of family-type farms, including construction and repair of farm houses and other essential farm buildings, totaled \$50,932,000, of which \$31,933,000 was provided through the insured loan program. Both the amounts loaned and insured set all-time records.

Approximately \$89,175,000 was advanced to permit farmers to continue normal operations under emergency conditions, including \$19,404,000 in special livestock loans.

FHA loans are available only to farmers who cannot obtain needed credit from other sources. Borrowers are required to refinance their loans as soon as possible. Applications for loans are made at the 1,500 county offices of the agency, serving agricultural areas throughout the United States, Alaska, Hawaii, Puerto Rico, and the Virgin Islands. The eligibility of applicants is determined by local county committees composed of three members, at least two of whom are farmers.

During the fiscal year 1955, collections on principal and interest, including collections on insured loans, amounted to \$257,927,000, compared with \$194,539,000 in 1954. Loans outstanding as of June 30, 1955, totaled \$896,739,000.

R. B. McLEAISH,
Administrator.

FASHIONS. Fabrics.—Fabrics in the year 1955 were enormously varied and temperamentally in accord with prevailing fashions. Textures, weights, and looks contributed positively to the sliver-slim silhouettes. Spring suitings and coatings weighed ounces less, felt smooth and flat to the touch, and, in general, presented a trim, well-nourished appearance.

Wool, silk, linen, and cotton—used alone or compounded with each other or with synthetic yarns—were woven with dry, close surfaces. Classic men's wear suitings were the prototypes of these fabrics: worsted, serge, gabardine, and flannel in glen plaids, hound's tooth checks, heathers, and plains.

Tweeds, whatever their yarn ingredients, maintained perennially high ratings, but were divested of some weight, bulk, and bumps. Heather and gorse were played down in favor of genteel urbanity. This fresh invasion of breeze-weight fabrics made the year-round wardrobe

idea increasingly plausible to consumers on a seasonal buying schedule.

Crisp-bodied silks dominated the spring's dress scene: pongee, shantung, surah, and the inevitable crepe for day; and taffeta and peau de soie for dusk onwards. Chiffon floated in at night.

A slew of summertime's bright cottons and silks showed a bias for the Far East: sari prints, bleeding Madras plaids, and swirling Paisleys. Plaid hit the jackpot; all the Scottish clans piped their way into coat, suit, dress, and sportswear circles, with Black Watch most in evidence.

Men's wear suiting fabrics remained popular throughout the winter. Deep-pile and knitted-look wools were much in evidence for heavy coats. All markets from hats to shoes gave fur, both real and fake, a workout. Interest was stimulated in a fur-like coating, blended of Dynel and Orlon, which did its best to look like beaver or bear. Other fur-like fabrics popped up frequently.

Wool jerseys, bantam-light broadcloths, and wools scored in dresses with round-the-clock potential. For evening, satin was the big success. Orientally flavored damasks, metallic-threaded brocades, and lamé were also highly esteemed.

Color.—After the first crocus announces spring, navy blue is seldom far behind. This color again was the 1955 leader in coats, suits, and dresses. Other blues fared well, too. Spring shades as a whole were on the whitish-but-clear side and in pleasantly vivid casts. Beige showed in nutshell nuances—cashew, peanut, and walnut—and there was a fair share of gray, black, and white.

Summer was a high time for yellow and brown. The freshest prints depicted abstract, blurry conceptions of botanical and marine life.

Winter liked all the browns. Gold and red, brilliant or antiqued, proved good, as did *soignée* black. In 1955, the smart way to strut one's color was to stick to the same one, from top of head to tip of toe.

COURTESY OF HARPER'S BAZAAR

The "hattier" hat, featured by Balenciaga in 1955.

Silhouette.—Continuing headlong during 1955 in the direction indicated for several fashion seasons, the silhouette was streamlined to racing-car proportions. It cast its svelte shadow on every price, type, and size line, including even juniors, usually the loudest partisans of wasp waists and full skirts. Shoulders were narrow and natural, and sleeves were slender cut and set in high armholes. The bustline was a slow curve, while the waistline remained unclutched, inches below its normal position. The new body focal point was the hips, flat and molded. European and American designers both emphasized this silhouette concept.

The suit with a longer jacket was a year-round success. Hemlines of straight and gently

(Left) A short evening sheath with a v-back in satin brocade; (center) Givenchy's sleeveless tweed tunic coat, worn over a jersey suit; (right) polo coat in sheared raccoon, accented by a chignon and tote bag in natural fur.

COURTESY OF HARPER'S BAZAAR

fitted jackets were put up anywhere between knee and thigh for extremists, at hipbone and cautiously below for moderates. Tunics, straight or molded from the waist like riding jackets; box shapes, tapered at the hips; and blazers and cut-always all got a lion's share of attention. The tailoring of these jackets, as precise as for men's jackets, featured sharp, narrow revers; flap pockets; and neatly buttoned, double-breasted closings. Skirts were predominantly straight, their hiplines often delineated by a yoke. Others swung in pleats—accordion, box, or inverted—from the waist or a molded yoke. Many of these suits were sold in three pieces with an overblouse.

The slim, tubular coat did well in 1955. Its vertical line was established by the use of low-placed pockets and half belts sitting beneath hipbone level. A compromise toward the full was achieved in the A-line coat, a Dior ingenuity, which was close-fitting at top and which widened toward the hemline.

Daytime dresses included the unadorned sheath with or without belt; the long-torso bodice mounted on narrow or pleated skirts; and shirt-waist and coat styles, slim or belled.

The major look for informal evening was covered. Short, Chinese-derived sheaths counted on opulent fabrics, like satin, or on understated, elegant ones, like broadcloth, to give them nighttime status. Many had matching slim coats or box jackets for a costume effect. Detachable overskirts and panels sometimes accompanied them to lend mobility.

In separates, overblouses gave tuck-ins a run for their money. They hung over slim and yoked full skirts. Sweaters, too, had great appeal. Inches longer and knitted in bulky stitches, they jacketed dresses and skirts. Endorsing the overblouse way, they added soft necklines and hipband detailing. They appeared in sheath form, tailored and short, high-style and ankle-length.

Millinery.—The hatless head in 1955 was an unfashionable one. Against the vertically directed silhouettes, hats asserted themselves in extravagance of size and shape. The most chic hats attained the circumference of meat platters and the depth of vegetable bowls. In spring, they leaned back on the head in straw and felt, looking like overturned flower pots. In fall they sat square on the brow or else tipped to one side. Fur and fuzzy bodies were executed in these deepened, widened shapes.

Footwear.—The spectator pump, an old-timer, was back in style. With its perforated toe and cropped heel, it complemented suits. Designers improvised on the spectator theme with sling-back, crosshatched-front effects for dressy offerings. Pumps and flats came in glove-soft leathers and were trimmed down a full half inch at the heel. Two-color, two-leather shoes, colored soles, and printed leathers for uppers and linings were innovations.

Accessories.—Accessories worked hard to animate the dignified clothes. In jewelry, pins were massive and were cast in the images of crosses, buckles, and bowknots; branches and leaves; and birds, bees, and butterflies. Bracelets were spectacularly sized, too, in gilt and stone-studded cuff shapes, while earrings favored big, button types. Rhinestone jewelry emulated diamond settings with comparative success. Baroque pearl and bead mixtures, in spring's clear tints and winter's blackened ones, were bunched for necks and wrists.

Handbags clung mainly to their long, lean

contours. There were many of patterned leather and fabric early in the year, and of genuine and ersatz fur in winter.

The longer, slimmer-bodied glove was in the limelight in 1955, crushed down to meet less-than-wrist-length sleeves.

Men's Clothes.—The most popular men's business suit in 1955 was single-breasted, natural-shouldered, and narrow-lapeled, and was cut along easy, comfortable lines. Three-button varieties provided competition for the two-button styling. Dark colors, summer and winter, gained growing support because of their conservative looks. Charcoal grays and browns, and high-style olive green were all-year favorites. For suits and shirts, wash-and-wear fabrics in synthetic and natural blends lent their wrinkle-and-wilt resistant and air-conditioned properties.

Colored shirts for business, particularly in pin checks and stripes, won acceptance because they looked well with darker-toned suits. The dictatorship of the white shirt was shaken, but by no means overthrown. Heavy cotton walking shorts, cut with slim legs and flat hips, won greater popularity.

Sports shirts, such as cotton jersey pullovers, owed their convertible-collar and bateau-neck treatments to continental styling influences. Footwear designs were also continentally inspired. Shoes were flexibly constructed, lower cut, and more sparingly detailed, either with one-, two-, or three-eyelet fastenings, or as moccasin-type slip-ons. Black reasserted itself as a rival to brown for everyday wear.

Fashion Critics' Award.—Fashion's most coveted honor, the Coty American Fashion Critics' Award for outstanding creative achievement in fashion design, went to Jean Campbell of Sport-whirl, designer of separates and sport clothes; Anne Klein of Junior Sophisticates, designer of day and evening clothes in junior sizes; Herbert Kasper of Arnold and Fox, dress designer specializing in elegance at a moderate price; and Adolfo of Emme, trend-setter in millinery.

EVELYN FRANZEN,
Fashion Consultant; Editorial Staff,
"Woman's Day."

FATS AND OILS. World production of fats and oils and oil-bearing materials apparently reached another all-time high in 1955. Production of fats and oils was large in most areas, the notable exception being the Mediterranean region where output of olive oil fell to the lowest level since 1950. World production of soybeans, cottonseed, and peanuts, however, reached new peaks, while output of flaxseed and lard also increased.

In the United States, by far the world's largest exporter and producer of fats and oils, the 1955 soybean crop was estimated at 372 million bushels, 8% above the previous record of 1954.

United States flaxseed production in 1955 was the largest since 1948 and the third biggest of record. Peanut production was 70% more than the small crop of 1954, and the largest since 1950. Cottonseed output was larger than in 1954, while lard production was the largest since 1951.

The estimated production of fats and oils for the year ending Sept. 30, 1956 is 14.4 billion pounds, compared with an estimate of 13.6 billion for the year ended Sept. 30, 1955, and a 1937-41 annual average of 8.7 billion pounds.

World output of soybeans in 1955 was expected to reach a peak of nearly 764 million bushels, an increase of 6% over the 1954 revised estimate.

World peanut production was forecast at a record 12.1 million short tons, an increase of 5% over both 1954 and 1953. United States production provided the most significant increase. Harvests in Africa were also considerably larger than in 1954, while production in Argentina was down.

World flaxseed production was forecast at 139 million bushels, 14% more than the revised estimate of 122 million bushels for 1954. All major producing countries had larger production in 1955 than in 1954, except Argentina. The biggest increase was in Canada, where 1955 production (21.5 million bushels) was nearly double that of 1954.

World exports of fats, oils, and the oil equivalent of oilseeds reached a peak of almost 7.3 million tons in the calendar year 1954. The forecast for 1955 was 7.2 million tons. As the principal exporter, the United States was able to cut down sharply its government-held stocks of food fats and oils. The large world trade reflected lower prices; government sale for export on a bid basis; a high level of economic activity in Europe; reduced domestic production in Japan, Spain, and Argentina; and various United States government programs, such as those which enabled other countries to buy United States agricultural commodities with their own currencies.

CLARENCE J. ENZLER,
Administrative Officer, Office of the Secretary,
U.S. Department of Agriculture.

FAULKNER (originally **FALKNER**), **William Harrison**, American author: b. New Albany, Miss., Sept. 25, 1897. Considered by some critics as the outstanding living American novelist, he was awarded (May 2, 1955) the Pulitzer Prize for the best fiction of 1954 for his massive allegorical-symbolic novel, *A Fable*.

Born into a poor Southern family with a long aristocratic tradition, Faulkner grew up in Oxford, Miss., the "Jefferson" of his novels set in the South. After a desultory education, he joined the Canadian Flying Corps, and later served with the British Royal Air Force in France. Returning to Oxford in 1918, he spent two years (1919-21) as a student at the University of Mississippi and two years (1922-24) as university postmaster. Dismissed from the latter post, he eventually drifted to New Orleans, where, while working for a newspaper, he met the author of *Winesburg, Ohio*, Sherwood Anderson, who encouraged him to write. After *Soldiers' Pay* (1926), there followed a series of powerful novels of the Deep South which depict in violent and apocalyptic terms, not only the social history of the Southern aristocracy—its feudal supremacy, its degeneration, and its displacement by a vulgar commercial oligarchy—but also, and more important, the tragedy of modern man in the throes of spiritual disintegration. For "his powerful and artistically independent contribution to the American novel," he was awarded the 1949 Nobel Prize in literature in November 1950.

Faulkner's Pulitzer Prize-winning novel, *A Fable*, was nine years in the process of composition and is regarded by many critics as his greatest achievement. Taking place in the trenches of France during World War I, its story—clearly suggesting a parallel with the life of Christ, and the Passion Week in particular—tells, in the tortuous but powerful Faulknerian manner, of the conflict between a corporal in the French Army, who is the leader of a peace movement among the common soldiers of both sides, and the commander in chief of the Allied forces, who does everything in his power to recommence the bloody struggle.

Faulkner's other works (novels, unless otherwise indicated) include: *The Marble Faun* (poems, 1924); *Mosquitoes* (1927); *Sartoris* (1929); *The Sound and Fury* (1929); *As I Lay Dying* (1930); *Sanctuary* (1931); *These Thirteen* (stories, 1931); *Light in August* (1932); *The Green Bough* (poems, 1933); *Pylon* (1935); *Absalom, Absalom!* (1936); *The Unvanquished* (1938); *The Wild Palms* (1939); *The Hamlet* (1940); *Go Down Moses and Other Stories* (1942); *Intruder in the Dust* (1948); *Knight's Gambit* (stories, 1949); and *Requiem for a Nun* (novel, partly in play form, 1951).

FAURE, Edgar, French public official: b. Béziers, Hérault, France, Aug. 18, 1908. After World War II, during which he fought in the French underground and later was an official in the Free French government of Gen. Charles de Gaulle, he entered politics in 1946 through his election to the French National Assembly as a Radical Socialist. He served as a minister in successive cabinets from 1949, and held office as premier briefly in January-February 1952. He again became premier on Feb. 23, 1955.

During 1955, Premier Faure successfully pressed for the ratification of the Paris agreements by the French Council on March 27. In July he participated in the Geneva Conference (q.v.) of the heads of government, and on October 5 he issued a joint statement with Chancellor Konrad Adenauer of West Germany reaffirming support of the plan for Europeanization of the Saar.

A major problem facing Faure and his government was the formulation of a successful French North African policy. With respect to Morocco and Tunisia (qq.v.) his program was, in effect, to grant some measure of home rule. Toward this end, on April 22, Faure signed protocols of an agreement establishing a basis for future Tunisian autonomy. For Algeria (q.v.), the premier enunciated a program of greater integration with France, while at the same time projecting democratic reforms at the local level.

On November 29 the National Assembly refused, by a vote of 319 to 219, to give Faure's government a vote of confidence, after Faure had insisted on early elections for a new assembly. By resorting to a little-used constitutional procedure, Faure dissolved the assembly, thus necessitating the early elections on which he had insisted. In the meantime he remained in office as caretaker premier pending the elections in 1956. (See also FRANCE.)

FEDERAL BUREAU OF INVESTIGATION. The Federal Bureau of Investigation, the investigative arm of the U.S. Department of Justice, was established in 1908 by Attorney General Charles J. Bonaparte. The investigative jurisdiction of the FBI, strictly federal in scope, is based upon laws enacted by the U.S. Congress and directives issued by the president and the attorney general.

A fact-gathering agency, the FBI presently has jurisdiction over more than 140 federal investigative matters. Its primary objective is the

investigation of violations of specific federal laws within its jurisdiction, and the collection of evidence in such cases. Its investigative activities include the fields of domestic intelligence and general crime. The FBI also engages in cooperative functions designed to be of assistance to local, county and state law-enforcement agencies and to other agencies of the federal government. FBI headquarters are located in Washington, D.C., and 52 field offices are maintained in major cities throughout the United States and in Alaska, Puerto Rico, and Hawaii.

Intensive investigative activities continue in the field of domestic intelligence. These investigations have become increasingly difficult because of the security measures adopted by the Communist Party and its extensive underground operations. During the 1955 fiscal year, 21 additional Communist Party leaders were arrested; and trials of Communist Party leaders charged with violating the Smith Act resulted in 18 verdicts of guilty. From 1948, when 12 members of the national board of the Communist Party were indicted, through June 1955, 131 Communist Party leaders were arrested on Smith Act charges, and 90 were convicted in federal court; however, two of these were granted new trials.

During the 1955 fiscal year, the FBI conducted investigations concerning a number of organizations which have been cited as subversive by the attorney general under Executive Order 10450. Additionally, facts concerning other groups were reported to the Department of Justice so that determinations might be made as to their character. The facts gathered by the FBI concerning subversive organizations are promptly reported to the Department of Justice and to other interested agencies of the federal government. The FBI does not cite organizations as subversive, nor does it recommend that such citations be made.

Convictions in cases investigated by the FBI during the 1955 fiscal year totaled 10,615, as compared with 10,511 during the previous fiscal year. These convictions represented 96% of the persons who were brought to trial in FBI cases. Of this number, 92.4% were on pleas of guilty. Sentences resulting from these convictions totaled 29,296 years 3 months and 26 days. In addition, 6 life sentences were imposed. Apprehensions of fugitives in FBI cases totaled 10,182 for the fiscal year 1955.

During the 1955 fiscal year, fines, savings and recoveries in cases investigated by the FBI totaled \$59,664,535. In addition, Renegotiation Act claims adjusted in favor of the government totaled \$5,588,587. Included in the property recovered in cases investigated by the FBI were 14,254 automobiles.

Cooperation with local, state and federal law-enforcement agencies continues to be a vital part of the FBI's operations. The facilities of the FBI Laboratory and Identification Division are available to these agencies on a cost-free basis. During the 1955 fiscal year, the FBI Laboratory received 27,664 requests for assistance involving 133,724 scientific examinations of 118,398 specimens of evidence, as compared with the 126,518 examinations conducted in the fiscal year 1954.

Widely known as the nation's central repository for fingerprints and the best-known service unit of the FBI, the Identification Division, during the 1955 fiscal year, received 5,175,694 fingerprint cards from 12,704 contributors, an average of more than 20,000 fingerprints each working day. Fugitives identified through fingerprint

comparisons totaled 13,491. As of June 30, 1955, the Identification Division had 135,990,686 fingerprint cards in its files, representing approximately 71,000,000 persons.

As another of its cooperative services, the FBI lends its assistance in the training of law-enforcement officers. In promoting the program of police training, two sessions of the FBI National Academy were held during the 1955 fiscal year. With the completion of its 55th session in June 1955, the FBI National Academy had graduated 2,984 men representing police agencies in every state in the United States, Alaska, Hawaii, Puerto Rico, the Canal Zone, and several foreign nations. During the 1955 fiscal year, the FBI also participated in 2,315 police training schools held on a local basis. These schools are designed to assist all police officers in fulfilling their responsibilities in the field of law enforcement.

As additional aids to law enforcement, the FBI issues two publications—the *FBI Law Enforcement Bulletin* and the *Uniform Crime Reports*. The former, published on a monthly basis, serves as a medium for the exchange of ideas between law-enforcement agencies. The latter, published annually and semiannually, is a statistical analysis of local crime, and is based on reports submitted by more than 5,700 law-enforcement agencies throughout the United States. (See also *CRIME—U.S. Crime Statistics*.)

J. EDGAR HOOVER,
Director, Federal Bureau of Investigation.

FEDERAL CIVIL DEFENSE ADMINISTRATION. A vital arm of the United States security program, FCDA was created by congressional act (Public Law 920) approved on Jan. 12, 1951, to protect America's people, property, and production in event of enemy attack.

FCDA is charged with developing a national program to minimize casualties and damage from enemy attack, and to maintain maximum civilian support of the nation's armed forces. However, primary responsibility for civil defense action is vested in the states and their political subdivisions, with the federal government providing coordination and guidance.

(Realization that modern warfare creates problems which are not limited by geographic lines brought demands in 1955 that civil defense be accepted as a phase of the "common defense" for which the federal government is constitutionally responsible. It appeared probable that legislation to give the federal government greater responsibility and control would be introduced in Congress in 1956.)

FCDA assumed a second responsibility in 1953 when President Eisenhower transferred to it the duty of coordinating the activities of all federal agencies in natural disaster relief.

In August 1955, FCDA's ability to cope with natural disasters was put to its sternest test when hurricane floods in the Middle Atlantic and New England states caused damage expected to approximate \$500 million. Civil defense volunteers were credited with saving uncounted lives and with helping to keep the damage toll down. FCDA allotted \$6.5 million in disaster funds and brought a score of federal agencies into a cohesive all-out relief and rehabilitation program, with the total United States expenditures expected to approach \$100 million.

FCDA planning against military attack is based on assumptions that potential enemies have the capacity of delivering on targets thermonuclear weapons capable of destroying entire cities;

that the most logical targets are some 90 to 100 cities in 70 "critical target areas" housing industrial or military concentrations; that ground bursts of weapons with the destructive power of millions of tons of TNT, creating enormous clouds of radioactive material that falls back to earth over thousands of square miles, make the entire nation vulnerable; but that an effective defense to save millions of lives is possible.

The defense calls for evacuation of critical target cities, moving populations outside a circle, 12 to 15 miles from any presumed aiming point; shelter for all those evacuated and for everyone within the likely fallout area; care and feeding for all dispersed individuals in predetermined reception areas; and full rescue, support and recovery efforts by all areas remaining unaffected by the attack.

The defense of the 70 critical target areas was recognized as a national problem after the Atomic Energy Commission announcement (February 1955) that fallout from a hydrogen bomb test in the Pacific had covered an area of 7,000 square miles.

Fallout was taken into consideration during Operation Alert 1955 (June 15-17) when 54 mainland cities were presumed to have been hit by bombs ranging in power from 20 thousand to 5 million tons of TNT equivalent.

Some target cities held partial or theoretical evacuations. Exercise evaluations indicated that 8½ million people would have died in such an attack, but 2½ million more would have been saved from the few cities ordering evacuation. Another 8 million would have been fatally stricken, many by radiation.

After these tests, Congress appropriated \$10 million to FCDA to begin survival studies in critical target cities and their environs. These are to determine evacuation feasibility, corrective construction necessary to speed evacuation, relocation sites, shelter availability, and related subjects.

In addition to the funds for survival studies, FCDA's 1956 fiscal year appropriation includes \$12,125,000 for operations, \$12,400,000 for contributions (matching funds with states), \$32,650,000 for stockpiling of emergency supplies and equipment, and \$1,005,000 for financing delegations to other departments.

VAL PETERSON,
Administrator.

FEDERAL COMMUNICATIONS COMMISSION. The FCC's 21st year of operation (fiscal year 1955) saw the United States served by nearly 800,000 radio transmitters and some 54 million telephones. Radio broadcast station authorizations approached the 6,300 mark. Radio operator authorizations included over 986,000 commercial and 136,000 amateur licenses.

George C. McConaughy became chairman of the FCC on Oct. 4, 1954, to fill out the unexpired term of George E. Sterling, who resigned. The commission operated during the year on appropriations of \$6,911,769. Personnel numbered 1,094. With the vast expansion in communications, the commission's administrative burden has more than doubled in the past five years.

National Defense.—The FCC continued its activities in the coordinated defense effort of government agencies and the communications industry. Of particular importance is CONELRAD (Control of Electromagnetic Radiation), a plan to prevent the use of radio signals as guide "beams" by hostile aircraft. The plan has been

"Operation Alert," civil defense test on June 19, 1955, clears New York City's normally congested Times Square.

applied to broadcast, aviation, and public safety stations. About 1,300 AM broadcasting stations are cooperating. During the year the commission set up a priority system for telephone and telegraph communication in the event of a national emergency.

International.—International carriers offer telegraph and telephone service to virtually all points of importance in the world. International radiotelephony reached a record 1.1 million calls in the calendar year 1954. Work was started on twin submarine telephone cables across the North Atlantic and between the United States and Alaska. Under a requirement that Western Union divest itself of its international cable system, that company announced that it was negotiating to sell those facilities. The commission participated or was represented in 10 international meetings during the year.

Common Carriers.—Over 54 million telephones were in operation as of June 30, 1955. The telephone industry handled a daily average of 186 million local and 6.8 million long distance calls during the 1955 fiscal year. The Bell System, which handles about 83% of the business, now provides 6.2 million telephone circuit miles by microwave radio. It also furnishes over 67,000 miles of broad-band channels (mostly by radio) in relaying programs to 363 TV stations in 200 cities. Over 600 mobile radiotelephone systems are in operation.

Western Union, the domestic telegraph carrier, handled 152 million messages on its land system in the calendar year 1954. As a means of speeding service, the number of Desk-Fax installations were increased to 20,000 and the teleprinter tieline installations to 23,000.

Safety and Special Radio Services.—Authorizations in these nonbroadcast radio services rose to over 300,000 during the fiscal year 1955. The nearly 50 classes of radio stations employ close to 770,000 fixed and mobile transmitters. Station authorizations as of Sept. 30, 1955, were distributed mainly among the following categories: marine, 52,908; aviation, 44,183; industrial, 26,357; land transportation, 21,608; public safety, 19,153; amateur, 139,628; common carrier, 2,001; experimental, 661; and miscellaneous, 2,704. The most extensive growth of radio has been in the fields of industry and commerce. Action was taken during the year to establish a permanent licensing policy for private microwave systems.

Broadcast.—As of Sept. 30, 1955, broadcast authorizations collectively exceeded 6,400, of which 4,185 were for program outlets (with

3,921 on the air) and the remainder were pickups and other adjuncts. Of the 581 authorized commercial TV stations, 473 were on the air. Over 90% of the population was within service range of at least one TV station, and about 75% was served by 2 or more stations. The commission is taking steps to assist UHF (ultra-high-frequency) stations to operate on a comparable basis with VHF (very-high-frequency) stations. Of 34 educational TV stations, 15 were operating. The number of TV channels reserved for education rose to 258. AM radio station authorizations numbered 2,884, of which 2,771 were on the air. Commercial FM stations decreased to 555 (538 on the air). Of the 131 authorized educational FM stations, 124 were operating.

Field Engineering and Monitoring.—The FCC's field engineering and monitoring work was conducted through 6 regional offices, 24 district offices, one ship office, 6 suboffices, and 18 monitoring station. Activities included policing of traffic in the radio spectrum, giving bearings to ships and planes in distress, giving radio operator examinations, and other functions. Interference complaints during fiscal 1955 approximated 18,000, of which over 15,700 involved broadcast, and most of these commercial TV. Under commission encouragement, 437 local TV interference committees functioned in 412 communities. With the aid of mobile units, 105 unlicensed transmitters were uncovered. Budget limitations reduced the number of radio station inspections to about 7,200 (10,500 in fiscal 1954).

Research.—Much time was spent in developing VHF-UHF tropospheric propagation curves, as well as techniques for predicting service signal strengths under different terrain conditions. A study is under way on the relative merits, over greater distances, of line-of-sight microwave relays, as compared with tropospheric scatter relays. Rules were finalized for type acceptance of certain radio equipment. The commission's laboratory at Laurel, Md., studies various methods of transmission and reception in their service and interference aspects, interference to radio reception from electrical equipment, and new uses for radio, and tests certain transmitting equipment. It also develops and calibrates apparatus used by FCC field engineers. (See also RADIO AND TELEVISION; TELEGRAPHY; TELEPHONE.)

GEORGE O. GILLINGHAM,

Chief, Office of Reports and Information.

FEDERAL CROP INSURANCE. Development work on All-Risk Crop Insurance in 1955 by the Federal Crop Insurance Corporation was highlighted by the start of a concerted effort to strengthen the soundness of its operations from a business standpoint through a wider spreading of the insurance risk between commodities and geographic areas. Soybean insurance was started in 1955, barley was scheduled to be insured in 1956, and additional crops are to be added in future years. Insurance operations are being restricted to counties whose production and insurance history indicate that sound all-risk insurance of crop production costs can be developed and operated.

The corporation's experiences in 1954 and 1955 emphasized the high-risk nature of all-risk crop insurance, which was initiated by the government because this basic farm insurance was not available from private sources.

In 1955, catastrophic winter wheat losses struck a large area of the Southwest due to continued drought, wind, and insect infestation. Tor-

rential rains and floods caused heavy tobacco losses in some areas, particularly in Connecticut. Promising corn fields in some areas of the Midwest turned into total or partial failures during extreme heat waves. Drought devastated one of the lower-risk cotton counties resulting in insurance indemnities of more than \$500,000.

In 1954 the corporation's premium income was about \$23,000,000 for \$355,000,000 of crop insurance protection. Due to adverse crop conditions in several major wheat insurance areas, indemnities totaling over \$28,000,000 were paid to insured farmers.

In 1955, insurance was being operated in 794 counties: wheat was insured in 400, tobacco in 127, cotton in 101, corn in 102, multiple crops in 83, flax in 50, dry edible beans in 17, soybeans in 6, and citrus crops in 2. In some counties, two crops are insured under separate contracts.

The multiple plan of insurance is being converted to a more practical basis. While several crops will still be insured under the policy, losses will be settled separately for each insured crop, and premiums computed separately. There will be considerably more premium income, and more losses will be paid under the new multiple plan. In those counties where the older plan has operated satisfactorily, it will be continued for the present.

C. S. LAIDLAW,

Manager, Federal Crop Insurance Corporation.

FEDERAL DEPOSIT INSURANCE CORPORATION.

During the fiscal year ended June 30, 1955, there were five cases in which disbursements by the Federal Deposit Insurance Corporation were necessary to protect depositors of insured banks. Disbursements in these cases were \$3.1 million, and there remained unpaid claims of \$79,619.

From the beginning of operations in 1933 to June 30, 1955, the corporation has disbursed \$333 million in cases involving 427 banks in serious financial difficulties. This total consists of \$331.4 million for the protection of depositors and \$1.6 million to facilitate the termination of liquidations. Involved were approximately 1,400,000 depositors, with total deposits of about \$563 million. Full recovery of deposits was made available, in the form of deposits at other banks, payments by the corporation, or receivers' dividends, to all but 2,795 depositors. Losses to depositors were less than \$2 million. By June 30, 1955, the corporation's actual recoveries, plus estimated additional recoveries on disbursements to protect depositors, were \$302.6 million. Thus the loss from such disbursements was an estimated \$28.8 million.

Total assets of the corporation on June 30, 1955, amounted to \$1,717,189,827, of which \$1,711,528,619 consisted of United States government securities and accrued interest on such securities. Liabilities, including credits to insured banks toward future assessments, amounted to \$126,649,160. The \$1,590,540,667 excess of the corporation's assets over its liabilities is the deposit insurance fund, representing accumulated assessments and investment income in excess of losses and expenses in the past.

For the calendar year 1954, assessments on insured banks, at the rate of $\frac{1}{12}$ of 1% of their average deposits, amounted to \$144,056,518. Expenses and losses of the corporation totaled \$7,802,352, leaving net assessment income of \$136,254,166. Of this amount, \$54,501,666 (40%) was added to the corporation's deposit insurance

fund, and \$81,752,500 was credited to insured banks. Investments and other sources provided the corporation with \$37,358,064 of income in addition to that from assessments.

As of Dec. 31, 1954, the 13,541 insured banks held deposits totaling \$203.2 billion. Based on studies made in the past, it is estimated that 55.3% of this total, or \$112.4 billion, was insured. On that date the deposit insurance fund of \$1,542,697,382 was equal to 0.8% of total deposits in insured banks and to 1.4% of estimated insured deposits.

The Board of Directors of the Federal Deposit Insurance Corporation is composed of H. E. Cook, chairman; Ray M. Gidney, comptroller of the currency, vice chairman; and Maple T. Harl.

H. E. Cook,
Chairman.

FEDERAL HOUSING ADMINISTRATION. See HOUSING.

FEDERAL LAND BANKS. See FARM CREDIT SYSTEM.

FEDERAL MEDIATION AND CONCILIATION SERVICE. This service, created by the Labor Management Relations Act, 1947, is an independent governmental agency charged with the duty of assisting parties involved in labor-management disputes affecting commerce (other than rail and air transportation industries) to settle their differences through conciliation and mediation. The service possesses no power to compel the parties to settle, nor does it have any law-enforcement authority. It relies solely on the persuasive techniques of mediation and conciliation to bring the disputant parties to agreement without resort to work stoppages and to settle those which do occur.

Under the provisions of the Labor Management Relations Act, 1947, as amended, a party to a collective bargaining contract desiring to modify or terminate such contract must serve written notice on the other party 60 days prior to the expiration or modification date. If a settlement is not reached within 30 days thereafter, Section 8 (d) of the act specifies that such parties notify the service and any state or territorial agency. Upon receipt of such notification the service may offer its facilities to the parties if the dispute falls within its jurisdiction.

The service may intervene in labor-management disputes at the request of one or both of the parties or on its own motion, when, in its judgment, the dispute threatens a substantial interruption to interstate commerce. If state or other conciliation services are available, the federal service avoids intervening if the dispute would have only a minor effect on interstate commerce.

The service encourages the parties to conduct their own collective bargaining without governmental assistance. When such assistance is required, the mediator assumes the role of a neutral third party.

In the fiscal year ending June 30, 1955, over 35,500 dispute situations came to the attention of the service, and mediators were assigned to render assistance in 13,982 cases.

The service also maintains a roster of qualified private arbitrators from which panels are submitted upon the joint request of the parties. The cost of arbitration is paid by the parties.

The headquarters of the service are located in Washington, D.C., where the director and a small staff coordinate activities, establish policy, and conduct administrative affairs. Eight regional offices are set up throughout the United States.

A staff of about 225 mediators are assigned to these offices and other highly industrialized centers.

JOSEPH F. FINNEGAN,
Director.

FEDERAL NATIONAL MORTGAGE ASSOCIATION. See HOUSING.

FEDERAL POWER COMMISSION. Originally established in 1920, and organized as an independent agency in 1930, the Federal Power Commission has jurisdiction conferred by the Federal Power Act, the Natural Gas Act, certain sections of the Flood Control and River and Harbor acts, as well as by other statutes and executive orders.

Natural Gas.—During the fiscal year ended June 30, 1955, the commission issued 140 certificates covering 4,900 miles of natural gas pipelines and the installation of compressor units aggregating 259,000 hp. at a total estimated cost of \$465,324,000. As of June 30, 1955, commission authorizations since Feb. 7, 1942, the date when the present certificate provisions of the Natural Gas Act became effective, included more than 64,000 miles of pipelines and 4,400,000 hp. in compressor units, estimated to cost \$4,852,000,000.

As a result of the U.S. Supreme Court decision of June 7, 1954, in the Phillips Petroleum Company case, the commission assumed jurisdiction over sales of natural gas made by independent producers in interstate commerce for resale. During the 1955 fiscal year, 6,047 applications for certificates were filed by independent producers, of which 1,093 were disposed of by the commission.

Electric Power and Flood Control.—During this 12-month period the commission completed the processing of 128 applications of various types relating to hydroelectric projects, authorizing approximately 1,520,950 hp. of new capacity. As of June 30, 1955, 650 licenses were outstanding for projects designed to provide for a total ultimate installation of approximately 15,545,000 hp. Of this amount, approximately 9,844,000 hp. was already installed.

In December 1954, loads of the electric utilities reached a peak of 81.3 million kw., a growth of almost 9% in 12 months. Generating capacity increased 11.1 million kw. during 1954 to a total of 102.6 million. In the year ending June 30, 1953, the utilities added about 18,900 circuit miles of lines of 22,000 volts or higher for a total of about 265,000 circuit miles of transmission lines.

The commission staff, in cooperation with the Corps of Engineers, Department of the Army, and the Bureau of Reclamation, carried on some 101 investigations of river basins and reservoir projects, involving over 75 streams, with a view to determining the hydroelectric power potentialities of flood-control and other water-control projects.

Rates.—During the year ended June 30, 1955, approximately 1,201 gas and electric interstate rate filings were processed. Included were rate reductions amounting to approximately \$6,396,324, which were either required or authorized, and proposed rate increases of \$92,521,779 per year. Corresponding amounts for the preceding year were \$1,051,810 and \$146,510,300, respectively.

The commission permitted \$2,784,979 of the proposed increases filed in 1954 to become effective, because they were either fully supported or were contained in rate schedules for industrial

use only, and thus not subject to suspension. The remainder of the proposed increases—about \$89,736,800—were suspended pending hearings. Of this amount, all involved gas suspensions. On June 30, 1954, due to the lapse of the statutory period of five months beyond which the commission cannot suspend increases in rates, \$88,665,800 per year of these suspended gas increases were—on application—effective subject to the refund of any portion subsequently disallowed by the commission. At the beginning of the year there was a backlog of \$131,250,800, which, when added to the gas suspensions during the year, made a total of \$220,987,600 in suspended gas rates requiring commission action. Companies withdrew \$35,340,300, and the commission allowed \$31,832,800 and disallowed \$19,113,900. At the close of the year, the commission's dockets included \$134,700,600 of proposed gas rate increases under suspension which were filed during or prior to 1954.

As a result of the decision in the Phillips Petroleum Company case, the commission received from independent producers during the 1955 fiscal year 10,978 rate filings, including 2,633 rate increases totaling \$30,888,356, of which 124 amounting to \$12,145,189 were suspended and 2,509 totaling \$18,743,167 were allowed.

In addition to the rates filed by private utilities, the commission processed 220 contracts for the sale of electric energy from federal projects subject to commission review under the Bonneville Act, the Fort Peck Act, and the Flood Control Act of 1944.

JEROME K. KUYKENDALL,
Chairman.

FEDERAL RESERVE SYSTEM. Established under the Federal Reserve Act in 1913, the Federal Reserve System comprises 12 regional banks and their 24 branches. The system as a whole is under the supervision of a Board of Governors, assisted by the Federal Open Market Committee and the Federal Advisory Council.

Board of Governors.—The Board of Governors consists of 7 members appointed by the president, with the advice and counsel of the Senate. It exercises broad supervisory powers and formulates monetary credit and operating policies for the system as a whole. Members of the board in 1955 were: William McC. Martin, Jr., chairman; C. Canby Balderston, vice chairman; M. S. Szymczak; James K. Vardaman, Jr.; A. L. Mills, Jr.; J. L. Robertson; and Charles N. Shepardson. Each of the regional banks is under the supervision of its own board of directors and to some extent acts independently of the other Federal Reserve banks.

Member Banks.—Membership in the Federal Reserve System in June 1955 was held by 6,619 banks, of which 4,789 are national banks and the balance are state-chartered institutions which are voluntary members of the system.

Stabilization Policies.—During 1955, the policy of flexible economic management of the Federal Reserve System was brought into sharp relief due to the inflationary pressures generated by the expansion of credit, particularly in consumer and home mortgage categories and in loans for industrial expansion. The effect of credit expansion in private business had repercussions on both U.S. Treasury and Federal Reserve operations. Between January and July, banks sold a large volume of government securities, increased their borrowing from Federal Reserve banks, and re-

duced their excess reserves to support their volume of private loans. The increase in loans during the first half, amounting to some \$4 billion, was actually accomplished with a decline of about \$1 billion in total loans and investments in banks, reflecting the reduction of bank holdings in securities.

The Federal Reserve tightened the availability of credit by limiting its purchases of government securities, making it necessary for banks to borrow, and in January and February, sold \$1.3 billion of securities to absorb reserve funds. Margin requirements in stock markets were increased from 50% to 60% in January and to 70% in late April. From March until June, Federal Reserve banks increased reserve requirements for members and used open-market operations to diminish excess reserves; and discount rates were advanced from $1\frac{1}{2}\%$ to $1\frac{3}{4}\%$. Late in August, independence of action by the regional banks was demonstrated when the Cleveland Federal Reserve Bank imposed rediscount rates of $2\frac{1}{4}\%$ from $1\frac{3}{4}\%$. This action was followed by other Federal Reserve banks until in November the discount rate was $2\frac{1}{2}\%$, the highest in 21 years. Commercial banks in money centers raised minimum rates in all loan categories as pressure from the Reserve System increased through November. The restrictive measures taken by the Federal Reserve System, supplemented by the increase of 2% in down payments on home mortgages insured by the Federal Housing Administration, and conferences with private lenders to initiate measures of voluntary credit restraint, were shown to have an effect in dampening the expansion of speculative credit.

As the year-end drew nearer, all economic indicators were strong, except agriculture. Forecasts for 1956 were optimistic and the economy seemed to be proceeding with a "wait and see" attitude.

Federal Debt Management.—Despite the independence exercised by the Federal Reserve System in measures to stabilize the economy, the system is in a difficult position due to its additional responsibility as fiscal agent for the government. So long as deficit financing and the huge federal debt continue, the Federal Reserve banks must temper their actions in money management, as applicable to the public, by cooperating with the U.S. Treasury in federal debt management. The government, at the close of its 1955 fiscal year, reported a \$4.2 billion deficit and secured a temporary increase in the statutory debt limit to \$281 billion. On July 26, the federal debt was estimated at \$276.774 billion. No one can tell with certainty the actual dollar amount of the debt, as approximately \$80 billion reported in the debt total represents appropriations made which are as yet unexpended. This total shifts in the day-to-day operation of the government, but the total of outstanding obligations that must be marketed, the volume of issues to be refunded, and the spacing of maturities are only some of the problems in the administration of the Federal Reserve System. Government authorities were cheered in November by a report that tax collections had been larger than estimated, insuring a Treasury cash surplus for the fiscal year 1955. (See also BANKS AND BANKING; CONSUMER CREDIT.)

JOHN DE JONG,
Associate Director, News Bureau, The American Bankers Association.

FEDERAL SUPPLY SERVICE. See Index entry.

FEDERAL TRADE COMMISSION. In 1915 the Congress of the United States established the Federal Trade Commission as an independent government agency to safeguard free and fair competition for the nation. Under its statutory authority, the commission issues its own orders prohibiting illegal competitive activity. This law enforcement affects the sale of billions of dollars in goods and services. Orders range from prohibitions against individual merchants who misrepresent to the public the quality of their merchandise, to prohibitions breaking up price fixing conspiracies involving entire industries.

In 1955, for example, the commission terminated a monopolistic conspiracy among an international union of fishermen, its members, and the majority of canners in the Alaska salmon industry. In that case the commission said the effect of the conspiracy was unlawfully to raise the price the public had to pay for salmon. In the same year the commission negotiated 105 stipulations with businessmen requiring changes in advertising of such varied products as vitamin pills, hay fever remedies, greeting cards, dog foods, and fur coats.

Outstanding among its major actions was the commission's continuing drive against false advertising in the multi-billion-dollar accident and health insurance industry, a task begun the latter part of 1954. Thirty-one insurance firms thus far have been charged with misrepresenting the terms of their policies. Four of these firms have agreed to orders setting up standards for their advertising.

As a "body of experts," the commission also makes studies of the nation's significant economic problems and publishes its findings. In 1955 the commission's major contribution in this field was its *Report of Corporate Mergers and Acquisitions*. This report was characterized as "turning a factual searchlight on an economic problem whose dimensions have been obscured by lack of current information." The purpose of the report was to provide Congress, the Department of Justice, and the commission with facts needed to determine what corrective action should be taken.

The commission's case work deals with two broad categories of law violations: deception and monopoly. In the antideceptive field, the commission proceeds under the authority of the Federal Trade Commission Act, the Fur Products Labeling Act, and the Wool Products Labeling Act. The latter two embody congressional intent to require truthful labeling and advertising of these commodities. The FTC Act, on the other hand, gives the commission the broad power to prohibit "unfair methods of competition" and "unfair and deceptive acts and practices."

The same act empowers the commission to correct evils in the antimonopoly field. In addition, the commission has corrective authority under the Clayton Antitrust Act outlawing discriminations in price, exclusive-dealing and tying arrangements, corporate mergers, and interlocking directorates when their effect may be substantial lessening of competition or a tendency toward monopoly.

Under the Flammable Fabrics Act, the commission prohibits the importation and sale in the United States of dangerously flammable wearing apparel.

The commission enforces two additional statutes, the Export Trade Act, requiring the commission to supervise export associations granted conditional exemption from the antitrust laws, and the Lanham-Trade-Mark Act.

The commission does not depend entirely on its mandatory procedures to enforce the law. It also utilizes cooperative measures to correct or prevent unfair competitive practices.

In addition to employing the stipulation as a quick and inexpensive measure to assure truthful advertising, the commission also establishes trade practice rules for entire industries. These rules cover not only advertising but also other practices in the industry where unfairness might develop. The commission promulgates rules for specific industries following conferences with the industry members at which their special problems are discussed and solutions satisfactory to the commission are agreed upon.

Once formulated, these rules furnish guides for an industry in advertising its products and in dealing with its customers and competitors. For example, the rules established for the \$2.5 billion radio and television manufacturing industry control such matters as the use of the word "free" in advertising, representations concerning the effectiveness of TV antennas, guaranties, unlawful price discriminations, and imitation of established trademarks and trade names.

The 13 sets of rules adopted in the fiscal year 1955 achieved a 20-year high for activity in this field.

During the year the commission issued 36 antimonopoly complaints, an increase of 28.8% over the ten-year average covering 1944 to 1953. Thirty antimonopoly cease and desist orders were issued for an increase of 40.2% over that same period. In the antideceptive field, the 125 complaints issued represented a 49.3% increase over the 1944-53 average; and the 82 cease and desist orders, a 9% increase.

In September 1955 Commissioner John W. Gwynne became chairman of the five-man bipartisan commission, succeeding Edward F. Howrey, who resigned. Sigurd Anderson, former governor of South Dakota, and William C. Kern were sworn in as new members to fill the vacancies created by the departure of Mr. Howrey and James M. Mead, whose term expired. The remaining members of the commission are Lowell B. Mason and Robert T. Secrest.

FIJI. This South Pacific group of 322 islands (about 106 inhabited), lies 1,100 miles north of New Zealand. It constitutes a British crown colony, to which was added in 1881 the dependency of Rotuma (18 square miles; pop., 4,134 in 1954), comprising a cluster of small islands 220 miles northwest of the Fijian archipelago. The aggregate area of Fiji is 7,036 square miles; population, 333,389 (December 1954 est.), including 160,303 Indians, 143,100 Fijians, 16,208 whites, and 3,985 Chinese. Largest inhabited islands are Viti Levu (4,010 square miles), on which Suva, Fijian capital and chief seaport (pop., 25,395), is situated and Vanua Levu (2,137 square miles).

The governor (Sir Ronald Herbert Garvey, appointed Jan. 11, 1952) is responsible for the administration of Pitcairn Island (q.v.), and is British representative in relation to Tonga (q.v.). He is assisted by a 9-member Executive Council

(including one Fijian and one Indian), and a 31-member Legislative Council (including 5 Fijians, who also constitute the Fijian Affairs Board, and 5 Indians). In 1955, Rata Sir Lala Sukuna was appointed to the newly created office of speaker of the Legislative Council.

An estimated budgetary surplus of about £F284,000 for 1954 was reported. Revenue was estimated at £F5,137,389 for 1955; expenditure, £F5,063,426 (£F111 equals £100 sterling).

The government spent £F580,805 (or 12.5% of total expenditure in 1954) in operating or financially aiding 486 primary schools (1,478 teachers, 58,835 pupils). Fifteen government, denominational, and other schools provided post-primary education for 1,932 pupils.

Major agricultural crops are sugar (58,236 acres in 1954; 136,921 tons exported); rice (34,966 acres; 24,472 tons produced); and coconuts (167,540 acres; 37,584 tons of copra produced). Mineral production in 1954 included 78,411 ounces of gold, 17,794 ounces of silver, and 5,707 tons of manganese ore. Exports valued at £F11,239,985 in 1954 included raw sugar (£F5,540,645), gold (£F1,081,915), coconut oil (£F2,153,343), and copra (£F324,424). Trade with Great Britain and Commonwealth countries represented 91.16% of the total.

Highways aggregate 1,083 miles (636 miles of all-weather roads), and sugar companies operate 440 miles of narrow-gauge railway. Some 31,597 passengers used the Nadi Airport in 1954, and 1,552,118 tons of freight were handled. Fiji Airways operates internal services. The colony is also served by Tasman Empire Airways, which operates services to Tonga, Western Samoa, the Cook Islands, and Tahiti, and by Qantas Empire Airways, Canadian Pacific Airlines, and Pan American Airways.

FINANCIAL AND ECONOMIC REVIEW. Major financial and economic developments in the United States and Canada in 1955 are summarized in separate articles on specific economic subjects. For a reference guide to these subjects, see the Index entry, *Financial and Economic Review*.

FINE ARTS. See ARCHITECTURE; DANCE; MUSIC; PAINTING, SCULPTURE, AND PRINTS; THEATER.

FINLAND (SUOMEN TASAVALTA). A republic of northeastern Europe, bordered by Norway, Sweden, and Soviet Russia. Area, 130,119 square miles (including 12,190 of inland water); pop. (est. Dec. 31, 1954), 4,248,773, of which about 34.2% is urban and about 9% is Swedish-speaking. Chief cities and populations (Dec. 31, 1954): Helsinki (capital), 403,970; Turku, 110,084; and Tampere, 109,902. Vital statistics for 1954 (prelim.): birth rate, 21.3; death rate, 9.1; and infant mortality rate, 30.7. Life expectancy at birth in the period 1946–50 averaged 58.6 years for males and 65.9 for females.

Government.—Finland's unicameral Parliament consists of a Riksdag (House of Representatives) of 200 members elected directly for a four-year term. The president of the republic is chosen for a six-year term by an electoral college elected by the people. President Juho K. Paasikivi was re-elected in 1950 for a term ending in 1956. Following the elections of March 7–8, 1954, seating in the Riksdag was: Social Democrats, 54; Agrarians, 53; People's Democratic Union (including Communists), 43; National Union (Conservative), 24; People's Party, 13; Swedish People's Party, 13. Dr. Urho Kekkonen, Agrarian, heads a Social Democratic-Agrarian coalition which took office on Oct. 20, 1954.

Education and Religion.—Illiteracy is virtually nonexistent in Finland. In 1954 there were 241 elementary schools in the towns (106,429 pupils) and 6,131 school

districts in the country (435,341). Secondary schools included 201 lyceums (88,554) and 144 middle schools (26,347). There is also an extensive network of agricultural, commercial, technical, and teacher-training schools. Higher institutions include the state university at Helsinki (8,207 students in 1953–54) and 2 smaller private universities in Turku, one Swedish and one Finnish. The national church is the Evangelical Lutheran Church; other faiths have complete freedom. About 95% of the population is Lutheran.

Finance.—Revenue in 1954 totaled 213.1 billion markkaa; expenditure, 204.7 billion, leaving a surplus of about 8.3 billion. Expenditure for 1955 was estimated at 231 billion markkaa, including 25.2 billion for subsidies, 19.4 billion for children's allowances, and 13 billion for unemployment relief. The Finnish markka exchanges at a rate of 230 per U.S. dollar.

Production.—Principal domestic industries are metals and machinery, shipbuilding, ceramics, glass, textiles, building materials, rubber, chemicals, foodstuffs, and tobacco products. Export industries are dominated by the forestry group; major products and output in 1954 (in thousands of metric tons) were: chemical pulp, 1,573; paper, 847 (including 456 of newsprint and 165 of kraft paper); paperboard, 255; and plywood, 346. In the 1954–55 logging season, timber felling totaled a record 38.1 million piled cubic meters, about 14.7% over the previous year's cut. Copper ore (1954 smelter production: 28,080 metric tons) is the chief mineral; zinc and iron ores, asbestos, pyrites, and nickel are of lesser importance. Output of electric power (mainly hydraulic) was 5.64 billion kw.-hr. in 1954, a rise of 4.5% over 1953. Led by the export industries, the industrial production index (base: 1948 = 100) rose from 127 in 1953, to a record 142 in 1954. National income in 1954 aggregated 652.4 billion markkaa (605.3 billion in 1953).

Agriculture is featured by small, independent holdings. Due to unfavorable weather conditions, output was about 4% below that of 1953, bread grains alone of the major crops showing an increase. Chief crops and 1954 yields in thousands of bushels were: wheat, 10,000; rye, 5,750; barley, 13,800; and oats, 61,000. Output of potatoes totaled 1,079,000 metric tons; milk, 2,900,000; butter, 48,400; and cheese, 23,000.

Foreign Trade.—Exports in 1954 totaled 156,542 million markkaa; imports, 150,982 million. Forestry products comprised about 80% of exports; metal products, ships and parts, and foodstuffs contributed most of the remainder. Chief imports were machinery and equipment, iron and steel products, chemicals, coffee, cereals and other foodstuffs, fuels, cotton, and wool. Great Britain took 21.7% of Finland's 1954 exports; the Soviet Union, 21.5%. Britain provided 15.8% of imports; the USSR, 13.4%.

Transportation and Communications.—Finland's railway network (almost entirely state-owned) totaled 3,057 miles in 1954; public highways and roads, 39,400. The merchant marine included 613 vessels totaling 675,544 gross registered tons at the end of 1953. The domestic airline is Aero Oy; foreign lines operate into Helsinki; Passenger cars numbered 70,795 at the beginning of 1955; telephones, 408,351 (1953); radio receiver licenses, 905,317 (end of 1953). Finland had 64 daily newspapers in 1952 with a total circulation of 1.2 million.

Principal Events, 1955.—A high point in post-war Soviet-Finnish relations was attained in 1955. Following a conference in Moscow, September 16–19, between Soviet leaders and a Finnish delegation headed by President Juho K. Paasikivi and Premier Urho Kekkonen, a protocol was signed on September 19, renewing for

20 years the Soviet-Finnish defense alliance of 1948. At the same time, an agreement was concluded providing for the withdrawal of Soviet forces within three months from the military base on the Porkkala Peninsula (12 miles from Helsinki), which had been leased by the Soviet Union for 50 years under the Finnish Peace Treaty of 1947. In addition to the written agreements, the Soviet Union was reported to have pledged the return of the remaining Finnish war prisoners and civilians interned in the USSR, and to have withdrawn its objections to Finnish participation in the Nordic Council. Earlier in the year, a Soviet-Finnish trade treaty concluded on January 24 had contained a provision for a Soviet gold loan to Finland of about \$10 million. The protocol and agreement of September 19 were ratified by President Paasikivi on October 7, and by the Supreme Soviet of the USSR on October 11.

Aided by record output levels in domestic and export industries, the Kekkonen government's anti-inflation program appeared to have achieved a fair measure of success in 1955. Adopted in late 1954, the program sought to keep prices down by increasing subsidies to farmers and abolishing taxes on consumer goods. At the same time, controls on wages were removed. Limitations on credit expansion were imposed on Feb. 14, 1955, when the Bank of Finland decreed a partial sterilization of new bank deposits. With the lifting of wage controls, wages moved upward early in the year. On March 26 a 10-day strike of 24,000 civil servants in the lower salary brackets ended with a 10% pay rise for these and other government workers. The farmers then threatened a delivery strike in early April, demanding an increase in prices of farm products. The strike was avoided when the government agreed to peg farm income at a level corresponding to the general wage level. Despite these developments, the cost-of-living index rose only 2% in the first nine months of 1955.

M. J. G.

FIRES AND FIRE LOSSES. According to estimates of the National Fire Protection Association, fire losses in the United States for the calendar year 1954 totaled \$1,016,915,000, a decrease of 0.5% from the 1953 loss of \$1,021,720,000. The 1953 estimate included one \$45,000,000 fire (General Motors transmission plant at Livonia, Mich., on August 12), the largest industrial loss in history. Fire damage to buildings and their contents was valued at \$875,450,000 in 1954, \$889,120,000 in 1953, and \$793,500,000 in 1952.

Estimates made by the National Board of Fire Underwriters for the 12-month period ending Aug. 31, 1955, indicate a loss of \$869,773,000, or a decrease of 1.4% from the \$882,353,000 for the corresponding period ending Aug. 31, 1954. Estimates for the first 8 months of the calendar year 1955 show a decrease of 0.2% from losses during the same period of 1954.

According to the National Fire Protection Association's Department of Fire Record, as compiled from reports submitted by the fire marshals of the various states, there were approximately 774,600 building fires in the United States in 1954. It is estimated that there were 4.5 such fires per 1,000 population, or approximately one per 222 persons throughout the nation. An additional 1,218,700 fires involving aircraft (300), motor vehicles (161,500), forests (176,900), rubbish, grass, and brush (820,000), and miscellaneous categories (60,000) increased the num-

CLASSIFICATION OF LARGE-LOSS FIRES, 1954

(Individual loss of \$250,000 or more)

Classification	Number	Dollar Loss
Manufacturing	75	\$ 36,144,500
Warehousing	54	36,504,500
Aircraft	54	68,715,000
Mercantile properties	54	23,098,000
Lumber yards	10	4,000,000
Schools	9	2,962,000
Churches	6	2,677,000
Forest fires	6	3,994,000
Hangars	6	5,532,500
Garages	5	1,313,500
Bowling alleys	4	1,356,500
Hotels	4	1,500,000
Apartments	3	1,600,000
Armories	2	800,000
Electric generating plants	2	3,800,000
Laboratories	2	700,000
Office buildings and banks	2	656,000
Piers and wharves	2	750,000
Prisons	2	840,000
Vessels	2	2,250,000
Miscellaneous	9	3,166,500
Total	313	\$202,360,000

ber of fires of all types to 1,993,300.

Although it is not customary to attach a dollar value to the relatively insignificant property damage inflicted by rubbish, grass, and brush fires, the cost of extinguishing them represented a major percentage of the nation's 1954 fire bill.

T. SEDDON DUKE,
President, National Fire Protection Association.

FISH. See Index entry.

FISH AND WILDLIFE SERVICE. During 1955 the Fish and Wildlife Service's program emphasized the new partnership concept of cooperation with other federal, state, and private agencies in wildlife administration.

International Activities.—Participation by the United States in international conservation organizations has continued to bring benefits to the American fisherman. The Pacific halibut fishery, under the supervision of the International Pacific Halibut Commission, broke all catch records during 1954. The sockeye salmon fishery of the Fraser River System, managed by the International Pacific Salmon Fisheries Commission, produced the largest runs since the organization of the commission in 1937. Service officials are members of these commissions.

Inland Fisheries.—The Great Lakes Fisheries Convention was ratified by the United States and Canada in June 1955 and went into force in October. Implementing legislation is expected to be introduced in the second session of the 84th Congress.

Fish Restoration.—Funds appropriated for the Dingell-Johnson program from the excise tax collections on sport fishing tackle permitted the apportionment of \$4,532,800 to the states, Alaska, Hawaii, Puerto Rico, and the Virgin Islands for sport fish restoration activities. For the first time in program history, physical development and habitat improvement projects exceeded research activities.

Wildlife Restoration.—For the 17th consecutive year, the cooperative wildlife restoration program continued to play a key role in the nation's wildlife conservation efforts. Financial support for the program, derived from the income from the excise tax on sporting arms and ammunition, reached \$10,266,257, a decrease of 15% from the previous year. The principal field of interest continued to be improvement of wildlife habitat through a variety of creative and restorative actions.

Control of Predators and Rodents.—The fiscal year 1955 marked the 40th anniversary of federal participation in organized cooperative predator and rodent control work. Major effort was devoted to long-established projects to protect livestock from predators such as coyotes and bobcats. Control work in several western states was handicapped by drought conditions. Predator control work in Alaska was reduced, with emphasis shifted to protection of caribou and reindeer in the Arctic range and other big game species in southeastern Alaska. Service personnel assisted in community rat and mouse control projects as part of a current nationwide Grain Sanitation Program sponsored by industry and government.

New Wildlife Refuges.—The first federal wildlife refuge in Kansas was officially created in June 1955. Known as the Kirwin National Wildlife Management Area, the new 10,800-acre refuge is superimposed on lands acquired by the Bureau of Reclamation for the impoundment of waters in connection with the Kirwin Irrigation Project in Phillips County. Wildlife management will be coordinated with recreational use. Both ducks and geese will utilize the refuge.

A small refuge of 112 acres, located in an area on the eastern end of Long Island, was donated to the government by Mrs. Elizabeth A. M. Tilton of Southampton, N.Y. The property faces richly vegetated shoal waters which serve as an excellent feeding area for waterfowl.

Licenses.—Hunters and sport fishermen in the United States reached the record-breaking total of 32,654,199 individuals in the fiscal year ending June 30, 1954, and they paid almost \$85 million for fishing and hunting licenses and federal duck stamps. Fishing, as in past years, remained the most popular outdoor sport, with 18,580,813 men and women paying \$38,927,735 for all categories of state licenses, permits, and stamps. Hunters totaled 14,073,386, and they paid \$46,047,781 for state resident and nonresident licenses, permits, tags, and stamps, including \$4,542,860 for Migratory Bird Hunting Stamps.

Saltonstall-Kennedy Program.—With an allocation of \$3 million from the Saltonstall-Kennedy Act, approved by the president on July 1, 1954, the service began a new research program designed to help the ailing commercial fishing industry expand production and develop new markets for fishery products. Biological studies, utilizing \$1,434,200, were begun on more than a dozen fish and shellfish species. Development projects, amounting to \$1,441,000 were started on exploratory fishing, gear and equipment, technological advances, statistics, and educational and marketing programs.

Economic Survey.—To obtain an authentic measurement of the national interest in hunting and fishing, the service signed a contract in June 1955 for a survey to be made on the amount of time and money that American sportsmen spend annually in the pursuit of these sports. No national survey of this scope has ever before been made. The published results will be used by federal and state game and fish administrators in planning their programs.

(See also MARINE BIOLOGY.)

EDNA N. SATER,

Chief, Section of Current Information, Division of Information, U.S. Fish and Wildlife Service.

FISHERIES INDUSTRY. Landings.—Fisheries landings in the United States in 1954 were 5% greater than in 1953, owing especially to larger

catches of food fish. The catch in 1955 was expected to be 4% below that for 1954. Monthly wholesale prices through November 1955 were slightly lower than in 1954. In November 1955 the U.S. Bureau of Labor Statistics wholesale index for fish and shellfish was 112.0, or 9.2 points higher than a year earlier.

The year 1955 showed minor decreases in most major fisheries, particularly salmon, tuna, and Maine sardines. Alaska herring catches gained considerably. Marketing problems plagued the tuna and groundfish industries. The demand for frozen fish sticks continued to increase, and it was expected that production might reach 70 million pounds in 1955, as compared with 54 million in 1954.

The catch in the United States and Alaska totaled about 4.7 billion pounds in 1954, according to estimates of the U.S. Fish and Wildlife Service, as compared with 4.47 billion pounds in 1953, and a probable 4.5 billion pounds in 1955. From 24% of the catch, packers produced 863 million pounds of canned products, worth \$331,018,000. About 42% of the catch, plus processing waste, yielded by-products and bait worth \$81,571,000. Thirty-two per cent of the catch was used fresh or frozen, and 2% was cured.

Approximately 158,000 fishermen and transporters operated 90,450 vessels and boats in 1954, and fishermen averaged a catch of 29,800 pounds per man. Fishermen received \$345 million for the 1954 catch, \$7 million less than in 1953. Processing of the catch by 103,000 shore workers in 3,800 plants, and its distribution increased the value to \$1,070 million.

In 1954, for the ninth consecutive year, the menhaden fishery produced the industry's largest landings—875,000 tons, the greatest catch of a single species ever taken by American fishermen. The 1955 catch was expected to be slightly less.

The Pacific sardine catch, which had averaged over 500,000 tons annually from 1934 to 1945, rebounded from only 4,700 tons in 1953 to 67,000 tons in 1954, and would have been larger if the canned sardine market had been better. Prospects were brighter for 1955. The canned pack increased from only 63,612 cases in 1953 to 1,338,000 cases in 1954, but was far less than the record of 5,070,805 cases in 1950. The 1955 pack will be larger than in 1954, but both production and marketing continued to be hampered by imports of foreign sardines.

The 1954 canned salmon pack increased 6% to 4,163,000 cases, but decreased to about 3,600,000 cases in 1955. The continuance of conservation regulations closing certain areas in Alaska and shortening seasons in other areas reduced salmon catches considerably. The 1954 canned tuna pack of 10,889,000 cases, including the output from Hawaii and Puerto Rico, is expected to be slightly larger in 1955 because of increased imports of frozen tuna for canning. The canned anchovy pack in California decreased to 506,000 cases in 1954, 52% less than for 1953. The canned Maine sardine pack of 2,935,000 cases in 1954 was 5% over the 1953 total, but the pack is not expected to total much more than 1 million cases in 1955.

Menhaden, herring, Pacific sardines, "trash" fish, and processing waste were utilized in 1954 to produce 256,915 tons of fish meal, valued at \$32,753,000; 21,865,000 gallons of marine-animal oil, worth \$12,805,000; and fish solubles, valued at \$10,592,000. Shell products were valued at \$15,999,000.

Fresh fish landings in Boston, Gloucester, New Bedford, and on Cape Cod, Mass., in 1954 amounted to 491,649,000 pounds, valued at \$31,243,000, an increase of 9% in volume but a decrease of 6% in value from 1953 levels. San Pedro, Calif., led all ports in 1954 with landings of 190,500 tons, mainly tuna, sardines, and mackerel. Lewes, Del., received 154,000 tons, mainly menhaden; Reedville, Va., 117,500 tons, mostly menhaden; Gloucester, Mass., 116,000 tons, mostly ocean perch, groundfish, and whiting; Boston, Mass., 75,700 tons, mostly groundfish; Empire, La., 72,000 tons, primarily menhaden; Cameron, La., 67,500 tons of menhaden; and San Diego, Calif., 65,000 tons, mostly tuna.

Exactly 65,638 skins were taken in 1955 from the federally supervised fur seal herd on the Pribilof Islands (q.v.). Dressed and dyed skins sold at public auction in St. Louis, Mo., averaged \$94.14 in the fall of 1955, as compared with \$92.81 in the spring and \$76.92 the previous fall.

Frozen Fish Storage.—On Dec. 1, 1955, frozen fish holdings totaled 190 million pounds, as compared with a five-year average of 188 million pounds. Freezings of 281 million pounds during the first ten months of 1955 were 16 million pounds above those for the same period in 1954. Fillets (mainly ocean perch, haddock, and cod), shrimp, whiting, halibut, salmon, and bait and animal food made up the bulk of the freezings.

Foreign Trade.—Foreign trade in fishery products amounted to \$283,859,000 in 1954, up 4% from 1953 levels. Imports increased 3% to \$252,332,000, and exports were up 13%, accounting for \$31,527,000. Imported edible products set a new record for volume, 803,389,000 pounds, and for value, \$203,645,000. Principal increases in imports in 1954 consisted of fresh and frozen groundfish fillets and tuna. Imported nonedible products decreased 2% to a value of \$48,687,000.

Exported edible products declined to 62,724,000 pounds, valued at \$16,238,000. Exported nonedible products were valued at a record \$15,289,000. Imports of groundfish fillets during the first ten months of 1955 totaled 113,698,000 pounds, 5% less than for the same period in 1954.

A. W. ANDERSON,

Chief, Branch of Commercial Fisheries, U.S. Fish and Wildlife Service.

FITE, Warner, American philosopher and author: b. Philadelphia, Pa., March 5, 1867; d. Philadelphia, June 23, 1955. Twenty years a teacher of philosophy at Princeton University, he retired as Stuart professor of ethics emeritus in 1935.

Fite's interest in philosophy had been aroused by reading James Martineau's *Types of Ethical Theory* during his senior year at Haverford College, from which he was graduated in 1889. His graduate work for the University of Pennsylvania under Professor George S. Fullerton ("really my only teacher of philosophy") included a year at Philadelphia (Episcopal) Divinity School, and two years at German universities, after which he received the Ph.D. degree in 1894. His teaching posts before going to Princeton in 1915 included Williams College and the universities of Chicago, Texas, Indiana, and Stanford.

"I seem to have been nobody's disciple," he once remarked, although he expressed gratitude to Josiah Royce for positive stimulation, and to John Dewey for negative stimulation. He was a personal friend of Dewey, with whose philosophy

he sharply disagreed. Fite expressed great approval of "the disorderly philosophy scattered through the essays, novels, and poems of the Spanish author, Miguel de Unamuno y Jugo, who called himself a 'paradoxist.'" For himself, Fite declared, "only persons are real and only persons are significant," requiring primary emphasis in philosophy upon the "inner life" of man. This "personal idealism," which he said was not subjectivism and not a system, formed the basis of the intense individualism of the private person, which in turn was the basis of his early works: *Introductory Study of Ethics* (1903), *Individualism* (1911), *Moral Philosophy: The Critical View of Life* (1925), and *The Living Mind* (1930). His last two works were unorthodox critical studies: *The Platonic Legend* (1934) and *Jesus the Man* (1947). Fite was the master of a lucid, urbane, pungent, and epigrammatic style, which he used with great boldness in what some critics regarded as "aristocratic" attacks upon the schools of ethics which exalt society and its institutions at the expense of the individual.

HAROLD A. LARRABEE,

Ichabod Spencer Professor of Philosophy, Union College; author of "Reliable Knowledge" and other works.

FLAXSEED. See Index entry.

FLEMING, Sir Alexander, Scottish physician and bacteriologist: b. Lochfield, Darvel, Scotland, Aug. 6, 1881; d. London, England, March 11, 1955. Regarded as one of the most important events in the history of modern medicine, the discovery of penicillin by Dr. Fleming in 1928 introduced the era of such miracle antibiotics as streptomycin, aureomycin, and terramycin.

Educated at Kilmarnock Academy, St. Mary's Hospital Medical School, and the University of London, Fleming received his licentiate from the Royal College of Physicians and was made a member of the Royal College of Surgeons in 1906. In the latter year he also became professor of bacteriology at the University of London, and undertook research at the university's St. Mary's Hospital, serving as an assistant to Sir Almuth Wright, the vaccine pioneer who introduced the anti-typhoid inoculation to medicine. During World War I he was a captain in the Royal Army Medical Corps. After the war he returned to his research work at St. Mary's Hospital, from which he retired in November 1954 as director of that institution's Wright-Fleming Institute of Microbiology. He was appointed Hunterian professor and Arris and Gale lecturer at the Royal College of Surgeons in 1919 and 1928, respectively.

In 1922, Dr. Fleming discovered lysozyme, an antiseptic substance found in the whites of eggs

Sir Alexander Fleming
(d. March 11, 1955)

BRITISH INFORMATION
SERVICES

and in human tears. But it was not until September 1928 that a fortunate accident led to his discovery of penicillin. He had left exposed some culture plates of *Staphylococcus aureus*, and returning to his laboratory a few days later, found that a mold spore had settled on a specimen and had grown into a colony. About to discard the plates, he noticed that the bacteria had failed to grow in the neighborhood of the mold, indicating that some unknown substance had killed the bacteria. Similar to the ordinary fungus growth on cheese and bread, the mold was later identified as *Penicillium notatum*, belonging to the genus *Penicillium*. Fleming published the promising results of further experimentation in the *Journal of Experimental Pathology* in 1929.

With the outbreak of World War II and the consequent need for a more effective treatment of wound infections, Drs. Howard W. Florey and Ernst B. Chain of Oxford University initiated a systematic search for clues to the discovery of such a treatment. They found Fleming's report, and shortly afterward, with the financial assistance of the Rockefeller Foundation, corroborated his findings (1939). Obstacles to large-scale production were overcome in 1941 when Dr. Florey went to the United States to assist in establishing mass production of the drug. Penicillin proved of tremendous value in healing wounds suffered by British and American servicemen during World War II.

Besides sharing the Nobel Prize in medicine (1945) with Drs. Florey and Chain, Sir Alexander was honored by a number of medical societies and universities both in Great Britain and abroad, and, along with Dr. Florey, was knighted in 1944. His biography, *Fleming, Discoverer of Penicillin*, by Laurence J. Ludovici, has been published both in Great Britain (1952) and the United States (1955).

FLEMING, Philip Bracken, American army engineer and public official: b. Burlington, Iowa, Oct. 15, 1887; d. Washington, D.C., Oct. 6, 1955. During the administrations of Franklin D. Roosevelt and Harry Truman, Maj. Gen. Philip Fleming won a reputation as a gifted administrator in a number of public agencies, including the Public Works Administration, the Wage and Hour Division, and the Federal Works Agency.

On graduation in 1911 from the U.S. Military Academy, where he stood first in his class, Fleming followed the usual army career for some years, serving in the Corps of Engineers. He returned to West Point in 1926, where he was manager of athletics for seven years. His appointment as executive officer and deputy administrator of the PWA in 1933 was the first of a long series of government posts he was to hold. After his abilities as an administrator and as a trouble shooter had been demonstrated in his supervision of the Passamaquoddy Bay project (1935-36), he was assigned the task of reorganizing the Resettlement Administration, of which he was coordinator in 1936-37.

After a return to the army as district engineer in St. Paul, Minn., where he worked on projects for the improvement of the upper Mississippi, he resumed government work in Washington in October 1939 as administrator of the Wage and Hour Division of the Department of Labor. Two years later President Roosevelt appointed him administrator of the Federal Works Agency, a position he held until he became chairman of the U.S. Maritime Commission in 1949. Meanwhile, in 1942, he had been advanced to the rank of

major general. Following service as undersecretary of commerce for transportation (1950-51), Fleming was named ambassador to Costa Rica by President Truman, who awarded him the Distinguished Service Medal for his long and distinguished government service. Fleming held the ambassadorial post until 1953.

FLOOD CONTROL. This problem so generally associated with great rivers of the intermountain states of the United States came to bear with a vengeance on the Northeast in 1955. It came first on the tail of Hurricane Diane in mid-August. There were rainfalls of up to 12 and 14 inches within 24 to 48 hours, causing violent flash floods on tributary streams in a broad belt across eastern Pennsylvania, New York, and southern New England.¹ Then again in early October, an "extra tropical" storm hit much of the same area of southern New England, taking a smaller but serious toll in lives and damage among Connecticut's shore communities as rainfall of up to 12 inches over a three-day period caused streams to swell at a time when tides along the coast also were abnormally high.

The extensive damage to industrial towns and resort areas in the August deluge, and to residential communities and communications in October, focused new attention on flood control plans for the Northeast.² The severity of the August floods raised a question of whether flash floods on tributary streams can be controlled. (Existing federal flood control laws were written with major river systems in mind.) There is a certain amount of protection which federally supported projects could provide, and a new look at existing federal plans was being taken by Corps of Engineers offices throughout the Northeast. There remains a certain amount of protection which local communities must provide in the nature of small dams, floodways, and flood-plain zoning, to keep people from encroaching on lands that belong to the rivers. Much consideration was being given to these local efforts, too, as 1955 came to a close. The difficult problems are those of educating people to the risk involved in building on land vulnerable to floods, and of selling the value of flood control.

The subject of flood insurance gained considerable attention as an outcome of the year's disasters. Insurance companies are generally agreed that no flood insurance can be written privately. At the end of 1955, a congressional committee was studying possible legislation to put public money behind insurance against flood damage.

Until recent years, it was the Southeast and not the Northeast which was associated with floods due to tropical storms. In Florida in 1955 there was completed a key unit in the flood protection scheme developed as a result of hurricanes of years ago. The first pumping plant of a \$300 million plan for central and southern Florida flood control was put in operation in March.

¹ A final summary released to newspapers by the federal government on Oct. 30, 1955, indicated that floods in the Northeast in August killed 179 persons, seriously injured 6,992, destroyed 813 homes, and caused \$457,674,044 in damage. Pennsylvania and Connecticut led in the number of deaths (88 and 77, respectively); Connecticut and Massachusetts, with estimated damage of \$215,245,004 and \$110,412,808, respectively, suffered the most property damage.

² The U.S. Army's Corps of Engineers estimated that an investment of \$60 million in projects already authorized in Connecticut, Massachusetts, and Rhode Island could have saved \$50 million in the damage done by the August flood. Likewise, \$43 million worth of planned and authorized projects still unbuilt in Pennsylvania might have cut \$20 million from the total damage done there by the August storm.

This plant has six pumping units each capable of raising 360,000 gallons per minute through a lift of over 11 feet. In time of flood this plant will take rainfall off a highly developed truck farming area behind West Palm Beach.

Also completed in 1955 was a major pumping station for flood control in Louisville, Ky. This installation is said to be capable of lifting nearly three million gallons per minute. Called the Beargrass Creek pumping plant, it is intended to take the entire flow of the creek it straddles and lift it into the Ohio River in time of flood. It would thus keep Beargrass Creek flowing without allowing high water in the main river to back up the stream and flood adjacent properties.

In Dallas, Texas, major storm drainage works were pushed by the Corps of Engineers to carry Turtle Creek flood waters into the Trinity River and thus save future flooding of an industrial area. The \$10 million Dallas project relates to major reservoirs already completed upstream.

Australia.—There were disastrous floods in southeast Australia early in 1955, with damage estimates ranging to \$120 million. Several dams burst, requiring construction of new flood control works.

China.—It was reported in 1955 that floods and flood damage were increasing in Communist China, in spite of the number of recent river control projects. Floods were reported to have reached such proportions, in fact, that flood news was being critically censored.

(See also DAMS; RECLAMATION; SOIL CONSERVATION; and the Index entries, *Floods* and *Flood Control*.)

¹Unincorporated. ²Capital. ³Special census, 1955.
⁴Not including annexations which, in a special census of Jan. 21, 1954, totaled 92,100.

Executive.—Chief state officers in 1955:

Governor: LeRoy Collins (Democrat)

Secretary of State: R. A. Gray

Treasurer: J. Edwin Larson

Comptroller: Clarence M. Gay

Attorney General: Richard W. Ervin

Supt. of Public Instruction: Thomas D. Bailey

Constitution and Judiciary.—The present constitution went into effect in 1887. The Supreme Court comprises seven justices; chief justice in 1955 was E. Harris Drew.

Legislature.—The Legislature (Senate, 38 members; House of Representatives, 95) convenes in odd-numbered years commencing the first Tuesday after the first Monday in April.

The 1955 biennial session (April 5–June 3) appropriated \$405,087,125 for the 1955–57 biennium, largest in the state's history. Additional revenue was to

HOTEL FONTAINEBLEAU

Hotel Fontainebleau, opened in 1955 at Miami Beach, Fla.

be raised from sales tax revisions and an increased share in racing receipts.

Approval was given to a constitutional amendment providing for three district appeals courts; the Road Department was reorganized under a continuing executive director; a Highway Code was enacted; and, to stimulate tourist and industrial activities, a Development Commission (representing a consolidation of the Advertising and Improvement commissions) and a Development Credit Corporation were established.

In the field of education, local school authorities were empowered to assign children to schools for which they are best adapted; a Council for the Study of Higher Education was created; driver education was provided for public schools; and \$500,000 was appropriated for atomic research and a nuclear reactor for the University of Florida. In connection with public health and welfare, \$550,000 was appropriated for the purchase of the Salk poliomyelitis vaccine for needy children and expectant mothers; a program was initiated for state-county hospitalization of indigents; a Mental Health Council was established; medical, dental, and nursing scholarships were created; a teaching hospital was established at the University of Florida; and a rehabilitation center was created for alcoholics.

Other legislation increased unemployment compensation benefits, expanded the merit system and improved the retirement system for state employees; and coordinated law-enforcement activities in a Sheriffs' Bureau. Salary increases were provided for the governor (new salary, \$20,000), cabinet members and judges (\$15,000), and legislators (\$15 per diem). The maximum length of the regular legislative session was extended from 60 to 90 days. (See also below, *Principal Events, 1955*.)

Finances.—State treasury receipts (1954–55 fiscal year), \$656,858,582.12; expenditures, \$661,532,266.54; treasury balance, \$1,07,304,341.46. There is no long-term indebtedness.

Taxation.—State tax revenue (1954–55 fiscal year): \$320,770,993.92, including \$80,331,123.63 from the gasoline tax; \$74,026,996.80 from a 3% general sales tax and use taxes; \$32,451,756.36 from the beverage tax; and \$32,709,203.55 from motor vehicle licenses. The state has no individual or corporate income tax and no poll tax.

Banking.—As of June 30, 1955, the state's 79 national banks had \$2,187,498,000 in assets, \$1,642,426,000 in demand deposits, and \$388,663,000 in time deposits; the state's 154 other banks had \$1,151,346,256.60 in assets, \$649,499,064.75 in demand deposits, and \$227,621,261.87 in time deposits.

Education.—School attendance is compulsory for all between the ages of 7 and 15, inclusive. Operating expenditures were \$117,933,304 (\$217.34 per pupil) for public elementary and secondary education in day schools in the 1953–54 school fiscal year. Some \$52,845,914 was derived from local school districts, \$59,827,565 from the state, and \$5,259,825 from the federal government. Expenditures for construction and improvements totaled \$38,424,002. Teachers' salaries averaged \$3,697.66.

In the 1953–54 school year, 1,238 public elementary schools (kindergarten-grade 6) had 13,409 teachers and principals and 415,909 pupils; and 460 secondary schools (grades 7–12) had

FLORIDA

9,533 teachers and principals and 232,700 pupils. There was one state junior college with 197 students and there were three state universities with a faculty of 1,397 and 17,906 students on campus.

Social Welfare.—Public welfare expenditures from federal and state funds (excluding institutional costs) in the fiscal year 1954-55 totaled \$56,705,946.82, including \$39,667,801.41 for old-age assistance, \$14,575,036.12 for dependent children, and \$1,768,877.68 for the needy blind; a monthly average of 92,730 persons received public assistance. Expenditures for health and welfare institutions were \$14,709,306.30; for correctional and penal institutions, \$2,712,616.99.

FLORIDA WELFARE INSTITUTIONS

Type of institution	No.	Pop. ¹
Hospitals for mentally deficient and epileptic	1	962

Prison camps (road and other)	40	2,229 ⁴

¹ As of July 1, 1955, unless otherwise indicated. ² Average, fiscal year 1954-55. ³ School year 1954-55. ⁴ Average, fiscal year 1954-55.

Labor Force.—On July 15, 1955, the labor force was 1,212,300, including 20,900 agricultural workers. Nonagricultural employment was 845,100, and for the full year 1954 averaged 861,600. There were 82,000 unemployed workers on July 15, 1955; and \$11,882,553.38 in unemployment insurance claims was paid to workers during 1954.

Manufacturing.—There were 4,783 manufacturing establishments in 1954. Investment in new plant and equipment in 1953 totaled \$103,205,000. Earnings of production workers in manufacturing averaged \$56.44 in 1954 for an average work week of 41.5 hours, and \$57.82 for 41.3 hours in the first half of 1955.

MAJOR FLORIDA MANUFACTURES, 1954

	Persons engaged	Payroll & profit income (millions of dollars)	Value of output (millions of dollars)
<i>All manufactures</i>	<i>119,000</i>	<i>\$508</i>	<i>\$1,336</i>
Food products	32,000	130	560
Paper and pulp	11,000	66	153

Mining.—The overall value of mineral production in Florida in 1954 was \$106,517,000. In

FLORIDA MINERAL PRODUCTION, 1954

(In short tons, except as noted)

Mineral	Quantity	Value
Clays ¹	371,948	\$ 3,337,130
Peat	37,449	168,004
Petroleum (bbl.)	548,000	2,661,152
Phosphate rock (long tons)	10,437,197	64,499,877
Sand and gravel	3,468,842	16,832,066
Stone ²	14,225,356	2,411,823
Ilmenite	157,157	869,677
Rutile	7,305	820,041
Zirconium concentrate	17,959	14,917,230
Other minerals		

¹ Including fuller's earth, and clays for cement manufacture. ² Value included in "Other minerals." ³ Including stone used for cement and lime manufacture, but not dimensional stone. (Source: U.S. Bureau of Mines.)

1953, the state ranked first in production of phosphate rock, rutile and zirconium concentrates, second in ilmenite, and third in garnet and peat. It stood 27th among the states in value of output in 1953 (\$92,336,000), with 0.64% of the United States total.

Fisheries.—The commercial fish and shellfish catch in 1953 was valued at \$31,523,056. Poundages and values of major species were: shrimp, 58,471,431 (\$21,389,490); mullet, 28,709,218 (\$2,494,666); and snapper, 6,404,293 (\$1,672,444).

Agriculture.—Cash farm income in the first half of 1955 totaled \$374,518,000, and for the full year 1954 comprised \$128,715,000 from livestock and livestock products; \$418,248,000 from crops; and \$3,504,000 from government payments.

In 1954, receipts from principal crops and livestock included: oranges, \$157,976,000; dairy products, \$41,624,000; tomatoes, \$41,578,000; cattle, \$35,521,000; grapefruit, \$29,457,000; and tobacco, \$24,900,000.

The state's 57,543 farms (18,166,675 acres; harvested cropland, 1,937,014) in 1954 averaged 315.7 acres and \$28,466 in value of land and buildings per farm. Some 20,690 farms had telephones and 50,052 had electricity. Livestock on farms (Jan. 1, 1955) included 1,679,000 cattle and 3,854,000 chickens (excluding commercial broilers). During the week of Sept. 26-Oct. 2, 1954, 109,352 family and hired workers were engaged in farming.

FLORIDA CROP STATISTICS

Crop (and unit of production)	Average 1944-53	1954	Est. 1955

Tourists.—More than five million tourists visit Florida every year. Income from these visitors in 1955 was estimated by the Florida Chamber of Commerce to be upward of \$960 million.

Transportation and Communications.—State funds disbursed for roads and highways in the 1954-55 fiscal year totaled \$94,218,075.69, and newly completed construction and reconstruction in 1954 aggregated 987 miles.

Highways and roads on Dec. 31, 1954, totaled 55,050 miles (25,134 surfaced). Registered motor vehicles numbered 1,579,502 in 1954, including 1,183,965 passenger cars. There were 12 railroads (1954) operating 6,695.68 line miles, and in 1955, 23 regularly scheduled airlines and 216 airports and airfields (113 commercial and municipal, 55 military, 16 private, and 32 others).

Communication media included (1955) 104 AM and 20 FM radio stations and 16 operating television outlets (11 VHF and 5 UHF); 45 daily newspapers (circulation, 1,141,849) and 171 other newspapers (circulation, approximately 300,000); and (Jan. 1, 1955) 379,874 business and 649,820 residential telephones.

Principal Events, 1955.—LeRoy Collins, a Democrat of Tallahassee, was inaugurated on January 4 as successor to Acting Gov. Charley E. Johns to fill the unexpired term of the late Dan McCarty. A major part of the Collins program

was passed by the Legislature. Outstanding measures included establishment of a 37-member Constitutional Advisory Commission to report to the Legislature in 1957 on the question of the revision of the state constitution; increasing of teachers' salaries by \$200 annually per teacher; provision of \$4 million for expansion of junior colleges; establishment of presidential preference primaries; and authorization of \$281 million for the building of a toll turnpike to extend from the Georgia line, near Jacksonville, to Miami. Two westward spurs, to Tampa Bay and Pensacola, were being considered. (See also above, *Legislature*.)

Because of controversy between large- and small-county blocs, the Legislature failed to reapportion the Senate, as required every ten years by the constitution. Convened by Governor Collins into extraordinary session on June 6, the Legislature passed a reapportionment bill on July 13 which the governor vetoed because, he maintained, it did "not achieve for the people of Florida the representative government the constitution unequivocally assures them." After continuing disagreement, the Legislature recessed on September 29 until June 1956.

Since the constitution requires that the governor shall serve four years and not succeed himself, an important question before the Florida Supreme Court concerns the eligibility of Collins to run for a four-year term after he has served two years of the unexpired term.

The state Supreme Court declared on October 18 that the state constitutional provision requiring segregation in public schools had been nullified by the U.S. Supreme Court decision of May 17, 1954.

In other developments in the state, Mayor Abe Aronovitz, Democrat, resigned as mayor of Miami (effective November 24) and was succeeded by Randall N. Christmas, also a Democrat, who led the ticket in the election of November 15. On March 29, Dr. J. Wayne Reitz was appointed president of the University of Florida. A Circus Hall of Fame, comprising seven buildings which are to house circus memorabilia, was opened along U.S. Highway 41 on the north side of Sarasota on December 15. FOLSOM, Marion Bayard, American public official: b. McRae, Ga., Nov. 23, 1893. A business executive with considerable experience in the field of social planning, he was appointed secretary of health, education, and welfare by President Dwight D. Eisenhower on July 13, 1955 (effective August 1), following the resignation of Mrs. Oveta Culp Hobby.

Graduated from the University of Georgia in 1912, Folsom took his M.B.A. degree from the Harvard School of Business Administration in 1914, and immediately joined the Eastman Kodak Company in Rochester, N.Y. Except for his service as an officer in the Quartermaster Corps of the U.S. Army during World War I, he remained with the company until 1953. In 1921 he was appointed assistant to the president, George Eastman; in 1930, assistant treasurer; in 1935, treasurer; and in 1947, director.

In 1928, seven years before the creation of

a federal social security system, Folsom began developing a social security program at Eastman. In 1930-31, during the worst days of the depression, he devised an unemployment-benefit system involving Eastman and 13 other companies in Rochester, which came to be known nationally as the Rochester Unemployment Benefit Plan. His success in the field of social security planning led to an appointment to the President's Advisory Council on Economic Security (1934-35), in which capacity he helped draft the social security legislation enacted in 1935. He served as a delegate in 1936 to the International Labor Conference in Geneva, Switzerland, and in 1937-38 was a member of the Federal Advisory Council on Social Security.

Folsom was one of the original members of the Committee for Economic Development, a private nonpolitical research association founded in 1942, with which he held a series of jobs leading to the chairmanship which he assumed in August 1949. He also was a director of the United States Chamber of Commerce (1942-48).

At the time of his appointment to the president's cabinet, he was undersecretary of the treasury, a post to which he had been appointed by President Eisenhower on Jan. 22, 1953. As undersecretary he prepared the complete revision of the federal tax laws enacted by Congress as the Internal Revenue Code of 1954.

FOOD. See Index entry.

FOOD AND AGRICULTURE ORGANIZATION OF THE UNITED NATIONS. Founded in October 1945, the FAO collects and disseminates agricultural information and assists member governments in improving their agriculture (including forestry and fisheries) and in raising their standards of nutrition. In assisting underdeveloped countries (for which program it was granted over \$8 million in 1955 by the Technical Assistance Fund), the FAO acts through the Expanded Technical Assistance Program (ETAP).

The 8th session of the FAO Conference, the organization's governing body, was held in Rome on Nov. 4-25, 1955. Following a review of the organization's planned activities for 1956 and 1957 by the director-general, Philip V. Cardon, the conference raised the FAO's budget from \$6 million in 1955 to \$6.6 million for 1956 and \$6.8 million for 1957. Among the new activities approved by the conference were overall surveys of world resources and the use of nuclear energy in relation to agriculture. The conference appointed S. A. Hasnie of Pakistan to a 2-year term as independent chairman of the 24-nation Council, which meets between conference sessions. In addition, Tunisia was elected as the FAO's 72d member.

Agriculture.—In the Far East, the International Rice Commission sponsored training centers for the study of rice breeding and soil fertility. The FAO approved in principle a regional plant protection agreement for Southeast Asia under the International Plant Protection Convention.

In the Near East, the FAO continued in 1955 to assist in the combined efforts of the area's countries to control the desert locust. Also continued were pasture and fodder development and wheat and barley breeding. In addition, a center was developed for the study of land tenure and related problems.

In Europe, the European Commission for the Control of Foot-and-Mouth Disease was established and began operation in 1955. The European Committee on Agriculture, comprising sen-

ior administrators from the various national ministries of agriculture, met in Rome in 1955; and the Subcommittee on Agricultural Research of the Economic Cooperation Administration (ECA) met in The Hague, where agreements were reached for cooperation in agricultural research projects. In the Mediterranean area, pasture and fodder development work continued, and meetings were held to discuss the outcome of tests of uniformly grown grasses and legumes, and to arrive at methods for the effective control of the olive fly.

In Latin America, the 3d Meeting on Livestock Production in the Americas was held in 1955. The meeting published a report on the status and development of the Americas' livestock industry.

Direct advisory assistance to countries under the ETAP was continued during 1955 and included animal and plant disease control, animal and plant production, irrigation, soil classification and fertility, land settlement, improvement of agricultural cooperatives, and rural industries. For these and other projects, about 300 experts were engaged in 1955.

Economics.—In 1955 the FAO worked toward balancing the underproduction of some food products in certain areas with the overproduction in other areas by encouraging international consultation on the disposal of surplus stocks and by studying ways in which these surpluses can be used to assist underproducing nations. In addition, the basic work of maintaining and improving the FAO's world statistical and economic intelligence service on food and agriculture was continued, and further appraisals of international commodity situations were issued.

Regional consultations on selective expansion of agricultural production and consumption were held or arranged in the Far East, the Near East, and Latin America. Studies were also conducted on the effect of national policies on international production and prices; and, under the ETAP, increased assistance was given to countries in the improvement of marketing methods and the development of agricultural programs and statistical services.

Fisheries.—In 1955 training centers were organized for fishery administrators, in Copenhagen, Denmark, and for inland fisheries, in Bogor, Indonesia. Two of the FAO's major fishery projects were the Hong Kong Marketing Training Center and the Copenhagen Meeting on Fishery Statistics. In addition, work continued on the survey of aquatic resources of the world and on various activities in biology, economics, and technology. Under the ETAP, about 60 fisheries experts were scheduled for work in 30 countries.

Forestry.—Much useful technical and economic information was exchanged at the four regional forestry commission sessions in 1955: at Tokyo, in April, the Asia-Pacific Forestry Commission; at Teheran, in September, the Near East Forestry Commission; at Caracas, in October, the Latin American Forestry Commission; and at Rome, in October, the European Forestry Commission. In 1955 many other technical consultations were organized under the regular program, although fewer experts were in the field than in 1954.

Nutrition.—An expert Committee on Protein Requirements met during 1955. Particular attention was paid to the selective expansion of agricultural production and consumption, to surplus disposal problems, and to extension programs. Home economics activities were extended to the

Far East in 1955, and the governments of the Philippines and Indonesia were assisted in evaluating their present programs as a basis for future development. The FAO worked closely with the World Health Organization (WHO) and with the United Nations Children's Fund (UNICEF) during 1955.

Publications.—The FAO's first ten years of activity, and developments in food production and consumption were reviewed in *State of Food and Agriculture*, published in 1955. Also published in 1955 were: *Report of the Fifth Meeting of the Working Party on Rice Breeding*; *Report of the Fourth Meeting of the Working Party on Fertilizers*; *Report of the Fourth Session of the International Rice Commission*; *Flaying and Curing of Hides as a Rural Industry*; *Bibliography on Land Tenure*; *Manual of Supervised Credit in Latin America*; *Legislation on Fertilizers in Latin America*; *Equipment for Processing Tapioca*; *Cooperative Marketing for Agricultural Producers*; and *Some Recent Developments Affecting Livestock Production in the Americas*. Also published were the regular *Monthly Bulletin of Agricultural Economics and Statistics*; *Yearbook of Food and Agricultural Statistics*; *Yearbook of Fishery Statistics*, Vol. 4; *World Forest Resources*; further parts of *World Forest Planting Manual*; and, with a London publisher, *Fishing Boats of the World*.

PHILIP V. CARDON,
Director-General.

FOOD AND DRUG ADMINISTRATION. Operating under the Department of Health, Education, and Welfare, the Food and Drug Administration enforces the Federal Food, Drug, and Cosmetic Act and four related acts designed to protect the public from potentially harmful, impure, or misbranded foods, drugs, devices, and cosmetics in interstate commerce. These products have an annual commercial value of about \$60 billion for domestic shipments and of \$3 billion for foreign imports.

An amendment (July 22, 1954) to the Federal Food, Drug, and Cosmetic Act provides more expeditious procedures for establishing safe residue tolerances for pesticide chemicals useful for agricultural crops. During the fiscal year 1955, 18 petitions for tolerances or exemptions were filed under the new amendment, and 4 were established after review of the applicants' data on toxicity and FDA evaluation of what residue of the chemical would be without hazard if it remained in the food supply. Tolerances were established in March 1955 for 69 chemicals on which protracted hearings had previously been held.

Foods.—During the fiscal year, 1,234 tons of food was seized because it contained deleterious ingredients, and 3 firms were prosecuted for permitting such contamination. One was an exterminator who was fined and placed on 3 years' probation for careless use in a food factory of "1080," a deadly rodenticide.

Most of the poison-contaminated food seized was grain treated with mercury for seed use and later mingled with good grain, or accidentally contaminated when placed in uncleaned railway cars previously used for commercial chemicals. Frozen shrimp containing a quaternary ammonium preservative, imitation vanilla flavoring containing coumarin, and olives contaminated by glass particles were also seized.

Food seized because it was filthy or decomposed totaled 3,900 tons and, in number, accounted for 88% of the food seizures. Eighty-four of the 94 criminal cases in the food field were based on filth charges.

Both FDA and industry, with the assistance of other federal agencies and state and local officials, are continuing efforts to improve the sanitary handling of food from the farm to the ulti-

mate consumer. Twelve carloads of wheat contaminated by insects and rodents were seized between Jan. 1 and June 30, 1955, and more were voluntarily removed from food channels. These actions were taken after an extensive study and educational program on measures to protect grain from contamination. Programs are under way to improve raw stocks in the dairy industry, to eliminate diseased poultry and to further sanitation in the poultry processing plants, and to deal with rackets in incubator-reject eggs.

Drugs and Devices.—In the 1955 fiscal year, 29 drug and device recalls were made, involving products below labeled potency, nonsterile injectables, an eye solution, marketing without effective new-drug applications, variation from U.S.P. specifications, defective packaging, and untoward reactions when injected. Two devices with mechanical defects were recalled—blood donor and intravenous administration sets.

Illegal sales of prescription drugs were charged in 141 of the 154 drug and device prosecutions. Penalties ranged from nominal fines to \$5,000, and 5 jail sentences were imposed. Many state pharmacy boards have suspended or revoked licenses of pharmacists convicted of illegal drug sales. The remaining 13 prosecutions filed included 9 based on false and misleading curative claims. Others charged faulty composition and failure to bear the labeling required by law.

Applications for 433 new drugs—343 for human use and 90 for veterinary use—were approved after evaluation of their safety, and 2,277 supplemental applications went into effect.

Certification.—After predistribution testing, 329 batches of insulin products and 20,643 batches of antibiotics were certified. FDA also certified 4,655 batches of coal-tar colors, representing 5,140,202 pounds, for use in food, drugs, and cosmetics.

Imports.—Of a total of 24,151 import shipments inspected, 6,167 were refused entry because of failure to meet United States requirements.

Civil Defense.—Foods exposed in May 1955 to atomic explosion are under investigation for toxicity and nutritional values. The tests were conducted in cooperation with the Federal Civil Defense Administration, the U.S. Department of Agriculture, and several industry groups. Similar tests of drugs previously conducted showed that of the 42 common drug items only 2 (insulin and vitamin B₁₂) were reduced in potency. FDA began in June 1955 a training program for state and local officials, designed to help them safeguard food and drug supplies in case of attack.

Citizens Committee Study.—A committee of 14 distinguished citizens was appointed by the secretary of health, education, and welfare to make a study of FDA's activities. The committee recommended that FDA be better equipped to render the degree of consumer protection intended by Congress.

VIVIAN R. BOARDMAN,

Information Specialist, Food and Drug Administration.

FOOD RESEARCH. Utilization of Ionizing Radiation in Food Preservation.—No other subject compares with this in general interest to food researchers in almost every branch of the food industry. Federal funds for a concentrated research drive on this effort for the constructive use of atomic energy have been made available in the United States through the Quartermaster Food and Container Institute. Beginning in 1954 this agency has let

contracts to leading food scientists throughout the country.

The comparative radiation dosages (in rep., or "roentgen equivalent physical" units) necessary to kill or inactivate various kinds of organisms and biological systems have been plotted as follows:

Biological material	Lethal or inactivating dose
Man and higher animals	400 to 800
Sprouting vegetables, parasitic round worms, insects	5,000 to 30,000
Vegetative microorganisms	50,000 to 500,000
Bacterial spores	1 to 3 million
Virus, toxins, enzymes	5 to 10 million

From this crude chart, certain facts are immediately evident. The small dosages necessary to kill the human operator, as compared with those necessary for destruction of lower forms of life which may infect foods, points up the absolute necessity of adequate protection from the lethal rays. Thus, while large- and low-cost sources of such radiations in the form of fission products from atomic reactors are potentially available, the necessity of thick concrete or heavy metal screens during transportation and use of such radiations is the chief economic drawback.

The most immediate practical benefits will probably be those which can be accomplished with relatively small dosages. These include the inhibition of sprouting in stored root vegetables, eradication of insect infestation in grains, and destruction of trichinae in pork, all of which can be accomplished without significant damage to the food.

However, the most interesting and revolutionary possibilities are connected with the preservation of perishable foods by destruction of microorganisms. Radiation "pasteurization," that is, destruction of a large percentage of the vegetative microorganisms, can be accomplished with dosages in the range 50,000 to 100,000 roentgens. Thus the refrigerated storage life of various fresh meats may be extended four to five times with such relatively small doses. Surface molds on fruits are likewise destroyed within this range, increasing the life of the packaged products.

Complete sterilization of all kinds of perishable foods by radiation cannot be achieved with very many foods without some impairment of palatability. Radiations kill microorganisms which cause spoilage, but may actually accelerate oxidative changes such as rancidity and discolorations. In addition, the radiations may bring about reactions which do not normally take place, resulting in off-odors which vary in kind and intensity with the food being irradiated. Milk develops very pronounced off-odors at dosages far below those necessary to sterilize. Meats also develop strong "animal-like" odors and green and brown discolorations. The elimination of such undesirable side effects is the most important problem facing researchers in this field today. Measures which have been proved at least partially successful with some foods include exclusion of oxygen during radiation (that is, packaging in inert gases or vacuum), radiation in the frozen state, and addition to foods of chemicals which will protect the color or odor. (See also CANNING INDUSTRY.)

Potato Texture.—Plant histologists and biochemists have greatly increased our understanding of the fundamental causes of differences in texture of cooked vegetables and fruits. As an example, the texture of cooked white potatoes may be mealy, waxy, or sometimes sticky or gummy. The mealiness considered so desirable in

baked or fried potatoes results from a separation during cooking of the small individual cells which make up the potato tissue. The separation is caused by swelling of starch granules within the cells. Thus an excellent correlation has been established between the starch content and the organoleptic scores of different varieties of potatoes. Such high-starch varieties as Russet Burbank (Utah) and Kennebec (Maine) are excellent for baking purposes, whereas the low-starch White Rose (California), Red Pontiac (Wisconsin), and Chippewa (Maine), all soggy or waxy upon cooking, are good for potato salad but less desirable for baking. Stickiness and gumminess are undesirable in all types of cooked potatoes. This condition is caused by actual rupture of the cells during cooking, allowing the starch to come out into solution. Reducing the water content by soaking in salt solution, or storing mature tubers at room temperature until sprouting begins, decreases cell rupture and produces mealiness even in low-starch potatoes.

Soluble Nonfat Dry Milk.—This product, which has become generally available during the past year, dissolves very quickly and completely, even in ice water, is free-flowing (does not cake in packages), and does not foam. The process was developed by D. D. Peebles of the Western Condensing Company, Petaluma, Calif. Conventional low-heat, spray-dried, nonfat milk solids are utilized as the starting material. The already dried milk is introduced into a processing chamber where it is subjected to carefully controlled conditions of time, temperature, and moisture, after which excess moisture is removed. During the process, the product becomes granular, and a sufficient quantity of milk sugar is converted to the less soluble monohydrate to make the product nonhygroscopic.

Improvements in Fruit Jellies.—The time-honored method for the preparation of fruit jelly requires a concentration of the juice, usually achieved by boiling down to evaporate water. The prolonged heat treatment is recognized to be undesirable in several respects. The highly volatile fresh fruit flavors are lost, browning and loss of red pigments may occur, and there is a deleterious effect on the jellying characteristics of pectin. These changes may be minimized by using vacuum evaporators and fractionating columns for stripping volatile flavoring components from the vapor and returning them to the finished jelly. This process is expensive, however, and very few manufacturers are actually using it.

The Food Technology Department of the University of Illinois has recently described a new and simple process for apple jelly which involves boiling only a portion of the total juice to achieve concentration. The sugar and pectin are dissolved in the remaining cold juice, which is added at the end of the boiling-down period, and the whole is heated just enough for sterilization purposes. The resulting jelly is definitely superior in flavor.

Freeze-Dried Meat, Poultry, and Fish.—The process of dehydration from the frozen state at reduced pressures has been applied to various flesh foods with promising results. The dehydrated meat prepared for the armed forces during World War II was precooked ground meat, which rehydrated with difficulty and had limited usefulness. It was not possible to dehydrate such items as steaks or chunks of meat, fish fillets, etc. successfully by ordinary drying methods. University of California scientists have recently described the preparation of a great variety of raw prod-

ucts prepared by freeze-drying. In general, these products rehydrated readily, and flavor and color were not impaired, although there was some dryness of texture. (See also AGRICULTURAL RESEARCH SERVICE.)

FOREIGN AFFAIRS. See FOREIGN POLICY OF THE U.S.; articles on the major countries; and references under the Index entry, *World Politics*.

FOREIGN AID PROGRAMS, U.S. From the end of World War II to June 30, 1955, the United States spent over \$51 billion on foreign aid programs. Immediately after the war the aims of these programs were relief and economic recovery, chiefly in Europe. The Marshall Plan, however, coming into force in 1948 after the seizure of Czechoslovakia by the Communists, frankly recognized that an important purpose of large-scale aid to European recovery was the curbing of further Communist aggression. In 1949, Congress recognized the need to help European countries rebuild themselves militarily as well as economically under the Mutual Defense Assistance Program (MDAP) and to assist underdeveloped countries to develop under President Harry S. Truman's Point Four Program. The Korean War, beginning in June 1950, further shifted the emphasis from general economic to military aid.

A distinction between military and economic aid cannot, however, be made with much precision. Military aid often goes into basic types of production which strengthen a country's capacity to produce; and conversely economic aid, by increasing health, material well-being, and productive equipment, augments a country's military potential. Increasingly it is being recognized that the separation of United States aid into these two categories has chiefly a tactical significance in influencing the budgets of foreign governments, through making military aid explicitly or implicitly conditioned on adequate appropriations for defense purposes.

Creation of the ICA.—On June 30, 1955, President Dwight D. Eisenhower, reflecting congressional sentiment, terminated the year-to-year emergency types of government organization which had been dealing with foreign aid and established a permanent semiautonomous unit in the Department of State, the International Cooperation Administration (ICA).¹

¹The administration of foreign aid has gone through three major changes since 1951. The Mutual Security Act (October 1951) abolished the Economic Cooperation Administration (ECA) and transferred its functions (together with the Department of State's Point Four Program of aid to Southeast Asia and the Pacific, and the military aid program under the Department of Defense) to a new Mutual Security Agency (MSA). The Mutual Defense Assistance Program (MDAP), including the Defense Support Program (to furnish economic aid in the form of raw materials and production equipment for the manufacture of military equipment and other defense-needed commodities) and the Offshore Procurement Program (under which the Department of Defense contracts for the production of military equipment in certain European countries), was also succeeded by the Mutual Security Program (MSP) of the MSA. Under President Dwight D. Eisenhower's reorganization plans in 1953, the functions of both the MSA and the Department of State's Technical Cooperation Administration (a program of economic and technical aid to South Asia, the Middle East, Latin America, and Africa) were transferred to the Foreign Operations Administration (FOA), which went into effect Aug. 1, 1953, and was ended June 30, 1955.

John Baker Hollister, who had served as executive director of the Commission on Organization of the Executive Branch of the Government, known as the Hoover Commission, was appointed director of the ICA on April 30, 1955, and took office on July 1. He administers only the various economic aid programs, however. Military projects, which the Department of Defense had

INTERNATIONAL COOPERATION ADMINISTRATION

National Catholic Welfare Conference volunteers distribute milk to Pakistani natives under U.S. aid program.

for some time administered *de facto* under the Foreign Operations Administration (FOA), are now explicitly made the responsibility of that department. The departments of State and Defense are directed to coordinate the two types of programs, but no overall coordinator has yet been named.

Developments Through the Fiscal Year 1955.—

Through June 30, 1955, the United States had extended \$51,336 million in net grants and loans for foreign aid, of which \$26,260 million were made during the five-year period 1946–50 before the Korean invasion, and \$25,076 million in the five years thereafter. In the first five-year period military grants amounted to \$1,363 million and other aid to \$24,897 million, whereas in the second five years military grants rose to \$13,300 million and other grants and credits fell to \$11,776 million. During the fiscal year ending in mid-1955, however, the trend toward military aid was reversed. Such aid declined by 28% from the previous year, while nonmilitary grants rose by 23%. The greatest decline in military deliveries has been to western Europe, following the build-up of North Atlantic Treaty Organization (NATO) forces.

In the fiscal year 1955, \$434 million was paid to France, mostly from earlier congressional authorizations, in support of French and other forces in Indochina. After the cessation of hostilities there, \$216 million was paid to the separate states of Cambodia, Laos, and South Vietnam. Korea received \$207 million in economic aid during the year, 36% more than in the fiscal year 1954.

After the enactment of the Mutual Security Act of 1953 the United States government began to accept foreign currencies for the sale of surplus agricultural commodities; through June 1955, more than \$400 million worth of farm products had thus been sold. Most of the proceeds of these sales are used for grants and credits, but the amounts are incorporated into the figures of foreign aid given in Table 1 only insofar as these grants or credits have actually been expended. The Agricultural Trade Development and Assistance Act of 1954 allotted an additional \$700 million for a three-year program of this sort, and in 1955 the act was amended to provide a total of up to \$1,500 million.

Military Aid.—On Aug. 25, 1955, President Eisenhower reported to Congress on the build-up of military and economic strength under the Mutual Security Program (MSP) to June 30, 1955. At that date “our friends and allies” commanded about 180 divisions, 280 air squadrons, and in

Note: Because of rounding, totals do not necessarily add up.

¹ For security reasons military aid furnished under the MSP cannot be shown by country, but only by areas as designated in authorizing legislation. Data for Asia and the Pacific include shipments to Indochina, while those for western Europe include shipments to France, a part of which may have replaced equipment used by the French forces in Indochina. Military aid to Europe includes supplies, services, and contributions to the multilateral construction program of NATO. Grants include agricultural surpluses donated by the government for distribution abroad through United States voluntary relief agencies. ² Preliminary. ³ Negative entry of less than \$500,000. ⁴ Includes aid furnished through international organizations. ⁵ Because of the inclusion of dependencies in the grouping “western Europe,” data shown for other groupings, particularly “Near East and Africa,” are correspondingly understated.

excess of 550 combat vessels. Of these 180 divisions, NATO contributed about 100, in comparison with 12 divisions in 1949. European armed forces rose from 2,500,000 men in 1951 to 3,100,000 men in mid-1955, bringing the NATO total up to 6,000,000, including the 2,900,000 men of the United States armed forces. European NATO air strength had increased from 1,000 to 6,000 planes. Adding these to the 20,000 operational aircraft of the United States gives a total of 26,000 for NATO.

On the financial side, the United States had made an aggregate contribution to the military equipment of 35 friendly nations amounting to \$11.4 billion, of which \$8 billion went to Europe. Not included in these figures is \$2.8 billion in contracts for military items placed by the United States in friendly countries. This substantial effort on the part of one country has induced a doubling of the annual military outlay by European NATO members from the beginning of the Korean War to mid-1955, when it reached \$12.3 billion per year. The United States was spending nearly 13% of its national income in the fiscal year 1955 on defense; the European NATO countries had not risen above 8.7% in 1954-55, the last year for which the figure was available.

Economic Aid.—Military aid contributes to the economic strength of receiving countries. This is conspicuously true with regard to the balances of payments and the gold and dollar reserves of the countries assisted, and indirectly of all countries outside the United States. Western European holdings of gold and dollars rose in the first half of 1955 by \$500 million to a record high of \$13.8 billion. In view of all these facts, the United States has virtually terminated economic aid programs to Europe.

Elsewhere, particularly in the low-income countries, which account for 67% of the world's population but only 15% of the world's income, economic difficulties are less matters of international finance and more matters of real resources: scarcity of capital, lack of skilled labor and technical know-how, high rates of infant mortality, ill health, low levels of economic motivation, etc. Besides humanitarian motives, the United States aid program in underdeveloped countries has the purpose of curbing the inroads of communism in Asia, Africa, and Latin America by reducing unrest from poverty. Three facts—the relatively rapid recovery of Europe, the slow pace of progress in the underdeveloped areas, and increased Communist pressure in South and East Asia—account for the maintenance of economic aid to areas outside Europe during the seven-year period (1949-55) when such aid to Europe fell by a third or fourth each successive year, and even during the fiscal years 1954, 1955, and 1956, when total aid (military and economic) was falling significantly.

A small but important part of United States economic aid carries forward the Point Four Program under the caption of technical cooperation. For the fiscal years 1952 through 1955, annual appropriations for this purpose were \$32 million, \$148 million, \$117 million, and \$116 million; for the fiscal year 1956, President Eisenhower asked for \$172 million, and \$127.5 million was actually appropriated. Some 2,000 Americans and 1,000 foreign nationals are employed abroad in this program, which covers agriculture, economics, medicine, education, fishing, and fiscal surveys. The maintenance of these appropriations seems to bespeak congressional confidence in the good-

will created for the United States throughout the world by these activities.

Since 1950 the United States has also contributed about \$50 million to the much smaller technical aid program of the United Nations, which has aggregated \$80 million in the same period. Some liaison is maintained to prevent reduplication of United States and United Nations activities. Critics who argue that most of the foreign economic aid of the United States should be channeled through the United Nations ignore the important political purpose of United States aid, which could not be served by an international organization.

Foreign Aid Program, 1955-56.—President Eisenhower's special message to Congress on foreign aid, delivered on April 20, 1955, pointed out that the aid program was an essential complement of the general foreign economic program he had outlined in a message of Jan. 10, 1955. "That program," he said, "is designed to develop the economic strength and the security of the free world through healthy trade expansion among the free nations and through an increased flow of investment capital, particularly to underdeveloped areas." Beside the encouragement of United States private investment abroad, these complementary measures included lowering import duties, simplifying customs procedures, and furthering currency convertibility.

The president pointed to cumulative economic progress as a reason for giving no further aid to the original Marshall Plan countries of western Europe. But he strongly emphasized the need for military and economic aid to the "vast arc of free Asia, which extends from the Republic of Korea and Japan to the Middle East," especially threatened by Communist aggression. "The preponderance of funds requested of the Congress will be used to meet the threat there." The foreign aid message requested a total appropriation of \$3,530 million, of which about 77% was for military and 23% for economic aid.

As finally passed on July 28, 1955, after prolonged congressional debate, the foreign aid appropriations bill provided \$2,703,341,750 in new funds; \$302,000,000 was carried forward from a Korean War allocation. The total, \$3,005,341,750, was about 15% less than the sum originally requested by the president and represented a reduction of 42% from the appropriation for the previous year, which in turn was 21% lower than that for the fiscal year 1954.

A conspicuous development of the year 1955 in foreign aid was the strong emphasis placed on South and East Asia. In March, Harold E. Stassen, director of the FOA, outlined the character of administration plans for fighting communism in that area through aid programs. It was indicated that the United States, besides increasing its own outlays substantially, would invite western European governments to share in the Asian program, believing that joint participation would be less open to the Communist charges of imperialism and colonialism. Cooperation was also contemplated on the receiving end. The Colombo Plan powers, which now include all of the countries of the "arc of Free Asia," would act with the donor countries in distributing and utilizing aid much after the pattern of the Marshall Plan in Europe. President Eisenhower issued a special statement on April 11 to highlight the importance of an enlarged program for Asia.

These plans and attitudes of the administration were reflected in the foreign aid appropriation bill in its allocations of \$51 million in eco-

TABLE 2—FOREIGN AID APPROPRIATIONS
FOR THE YEAR ENDING JUNE 30, 1956

Distribution	Amount
General military assistance.....	\$ 705,000,000
Direct support for armed forces.....	317,200,000
Economic aid for defense support:	
Europe.....	85,500,000
Near East and Africa.....	113,700,000
Asia.....	800,000,000
Development assistance (economic aid):

South Asia.....	51,000,000
Latin America.....	38,000,000
Technical cooperation:	
General authorization.....	127,500,000
United Nations program.....	24,000,000
Organization of American States.....	1,500,000
Special presidential funds.....	200,000,000
U.N. Relief and Works Agency for Palestine Refugees in the Near East.....	58,366,750
Intergovernmental Committee for European Migration.....	12,500,000
Special assistance in joint control areas.....	21,000,000
U.N. Refugee Emergency Fund.....	1,200,000
U.N. Children's Fund.....	14,500,000
Escapee program.....	6,000,000
NATO.....	3,700,000
Ocean freight charges.....	15,000,000
Mutual Defense Assistance Control Act of 1951 expenses.....	1,175,000
Administrative expenses.....	33,500,000
Total.....	\$2,703,341,750
Previously appropriated funds carried forward.....	302,000,000
Grand total.....	\$3,005,341,750

nomic aid and \$800 million in defense support for Asia (not including the Middle East, which also received funds), and also in the establishment of a \$100 million President's Fund for Asian Economic Development, to be expended in Asia as the president sees fit through June 30, 1958.² (This fund is distinct from another \$100 million special presidential fund, to be used where the president deems advisable in extending aid).

Pros and Cons of Foreign Aid.—Military aid has generally been accepted somewhat fatalistically by the people and Congress of the United States as necessary in a world threatened by communism and totalitarianism. But a great debate has gone on regarding the merits of economic aid. Skeptics believe that European economies would have recovered without aid, and point out that communism is still a strong force in France and Italy. Defenders of the aid programs emphasize the rapid economic strides made in Europe under the Marshall Plan, as compared with Japan, where a systematic program of economic assistance was not launched. Communism might have claimed Greece and Austria without aid, and perhaps even larger countries in western Europe, they maintain.

With regard to economic aid to underdeveloped areas, opponents believe that the United States raises suspicions of imperialism by its offers of assistance, that it encounters overwhelming odds because of adverse cultural and political systems in its attempts to raise levels of living, and that population increases in these areas will swallow up all material gains. The supporters of aid programs do not deny these dangers, but point to the evident risk that low-income countries desiring economic improvement will seek satisfaction under Communist regimes unless

capitalist countries can demonstrate a better way of achieving it.

There is probably, in fact, a strong case for continuing economic aid in the underdeveloped areas, and possibly even for some increase. But the International Bank for Reconstruction and Development (q.v.) emphasizes the limits to what can be accomplished simply by supplying capital from abroad. Much more depends on the country's developing the internal conditions needed for its own economic progress.

HOWARD S. ELLIS,
Professor of Economics, University of California.

FOREIGN INVESTMENTS. United States investments abroad increased by nearly \$2.7 billion in 1954, bringing the total to more than \$42 billion. More than half of this increase was in private direct investments as United States business continued to expand its foreign operations apace. At the same time, foreign investments in the United States rose by a record of \$3.1 billion to a total of \$26.8 billion. Most of this growth was concentrated in an increased value of the holdings by foreigners of corporate stocks and in short-term dollar assets.

Developments during the first half of 1955 followed the recent trend. Americans increased their foreign stake by adding to their productive facilities abroad and making additional loans to foreign countries. But contrary to prior years, the \$1 billion increase in these investments during the 6 months ended June 30, 1955, were nearly all in private investments as repayments on government loans and credits nearly equaled the new credits made available to foreign countries.

Direct Investments Abroad.—Nearly three quarters of the net growth of United States investments abroad during the first half of 1955 were the result of the investment of new capital and the reinvestment of earnings in foreign subsidiaries and branches of American corporations. Amounting to about \$350 million each, these additions to American direct investments abroad continued at the level of the preceding year when they amounted to about \$1.4 billion. Based on partial information, the total increase in these investments for 1955 should again amount to at least that figure. This rate of growth of direct foreign investment has characterized the whole postwar period. Since the war, total investments in new foreign plants and facilities amounted to more than \$12 billion, or more than 170% of the investment at the end of World War II.

Canada continued as the most important area for new direct investments, with an indicated volume of \$600 million during 1955, two thirds of which was new United States capital. Increased investments were recorded in manufacturing, petroleum, mining, and finance, with some capital going into other industries. As a result, American direct investments in that country were estimated to be in excess of \$6.5 billion at the end of 1955.

The once rapid growth of direct investments in Latin America slowed to only \$222 million during 1954. While the total for 1955 should be somewhat larger, it is not expected to go to over \$300 million for the year. About one half of the new direct investments in Latin America came from reinvested earnings, while the remainder represented new United States capital.

² The president's Asian fund will presumably be used for long-term loans for river development, exploitation of mineral resources, transportation and communications facilities, and training centers, and for occasional grants. A regional economic organization, similar to the Organization for European Economic Cooperation (OEEC) in Europe, would include 15 countries: Afghanistan, Pakistan, India, Nepal, Ceylon, Burma, Thailand, Laos, Cambodia, South Viet-Nam, Indonesia, the Philippines, Formosa, South Korea, and Japan.

¹ Direct investments are given at book value, securities at market value, other investments or assets at their stated value.

² Includes U.S. government subscriptions to the International Bank and Monetary Fund; excludes principal on World War I indebtedness, amounting to \$11.4 billion at the end of 1954. ³ Includes an estimate of \$838 million of United States currency and coin held abroad which cannot be distributed by area. Also included are miscellaneous liabilities of various U.S. government agencies, amounting to \$177 million at the end of 1954. (Source: *Survey of Current Business*, August 1954; *Foreign Investments of the United States*, Government Printing Office, Washington 1953; and estimates by the author.)

All industries benefited from the new investments in the area, but the development of new mineral resources, and the scheduled investment programs in manufacturing industries and in public utilities continued to hold the main interest of American corporations. Investment flows connected with exchange restrictions and changes in foreign exchange rates were not as notable as in some of the earlier years.

Investments in western Europe and its dependencies rose by more than \$200 million during the first half of 1955. About half of this growth was through the investment of new capital. Most of these funds continued to be employed in the build-up of the productive capacity of manufacturing plants, which had been under way since the end of World War II. Indications are that this pattern would continue through 1956.

Additions to direct investments in other countries were about \$100 million for the first 6 months of 1955, but were estimated to amount to about \$250 million for the entire year. Most of these additional investments were again in the petroleum industry, which, during the postwar period, has consistently accounted for most of the growth in this area.

After Canada, with \$5,939 million, the countries with the largest amounts of direct investments at the end of 1954 were Venezuela (\$1,399 million), the United Kingdom (\$1,245 million), Brazil (\$1,050 million), Cuba (\$713 million), Chile (\$633 million), Mexico (\$523 million), Panama (\$433 million), Argentina (\$425 million), and Australia (\$387 million). Middle Eastern countries and European dependencies in that area accounted for about \$1,000 million, concentrated primarily in the petroleum industry.

Broken down by industries, manufacturing continued in first place at the end of 1954 with \$5,655 million. It was nearly equaled by petro-

leum, which accounted for \$5,353 million. Other industries with sizable investment totals were mining and smelting, with \$2,071 million; public utilities, with \$1,545 million; and trade, with \$1,148 million. All other industries accounted for \$1,976 million.

Due to higher market prices for foreign securities at mid-1955, United States portfolio investments abroad were somewhat higher than at year-end, despite a net capital return flow during the first two quarters. Debt retirements of Canadian issues held in the United States, amounting to about \$150 million, were an important factor in the capital return flow. This development was aided by the equalization of interest rates between Canada and the United States during 1955. The first 6 months also saw the repayment of bank loans of about \$65 million by western European countries.

About \$100 million was added to the market value of United States holdings of foreign dollar bonds in 1954 and 1955 as German issues were validated under the terms of the London agreements of 1953. In another noteworthy development, United States investors and financial institutions purchased, during 1954 and the first half of 1955, \$88 million of a new issue of the International Bank for Reconstruction and Development (q.v.). In addition, they participated in new loans and purchases of outstanding loans of the International Bank of \$57 million. As of June 30, 1955, there was a backlog of some \$34 million of such participations, which United States financial institutions had agreed to lend.

The large increase in short-term investments abroad during 1954 (\$750 million) had been caused mainly by a higher volume of short- and medium-term credits granted foreigners. During the first half of 1955, additional exports were financed by such lines of credit, but the pace of this investment of short-term funds was slowed

considerably, amounting to about \$210 million.

Government Investments.—During the first half of 1955, new government credits made available abroad exceeded only slightly the repayments on older loans. No great changes in this investment category were expected to take place during the remainder of the year. As in previous years, short-term government assets abroad consist largely of holdings of European and Far Eastern currencies, which represent mainly the United States portion of counterpart funds, and collections for agricultural exports from the United States.

Investment Income.—United States investments abroad earned about \$2.8 billion in 1954, including the undistributed portion of earnings of direct-investment companies. There has been little variation in this total since 1950 despite an increase of \$9.4 billion in the value of these investments in the 4-year period. Investment income for 1955 was estimated at about 10% above the 1954 totals, or about \$3.1 billion.

Direct-investment enterprises abroad continued to produce the greatest part of foreign earnings, amounting to about \$2.6 billion in 1955. Income from other types of investment remained fairly stable, accounting for about \$5 billion. About one half of the direct-investment earnings originated in the Western Hemisphere, while the remainder was split about evenly between Europe and its dependencies on the one hand, and the "other countries" area on the other hand. Petroleum remained the most important source of investment income, with about 40% of all earnings. Manufacturing was next in importance, accounting for about 30% of earnings. The remaining 30% was earned by all other industries combined, with mining and smelting being the most important source of earnings in the group.

Foreign Investments in the United States.—Foreign holdings in the United States grew by a record of over \$3 billion during 1954 to a total of \$26.8 billion. However, of the \$1.6 billion increase in the value of United States corporate stocks held by foreigners, only \$135 million represented net capital flows to the United States; the remainder reflected the rise in market prices of these securities during the year. The increase of \$1.3 billion of short-term assets in the United States reflects the net result of transactions between the United States and foreign countries and represents accumulations of dollar reserves in the United States.

Foreigners continued to purchase United States securities during the first half of 1955, and also made direct investments for a total of about \$500 million. In addition, the rate of increase of foreign dollar assets, while somewhat lower than in 1954, remained substantial. As market prices continued to rise, a sizable increase in foreign investments was expected for the year. At the end of 1954, the largest foreign owners of United States corporate stocks were Switzerland (\$1,353 million), the United Kingdom (\$1,153 million), Canada (\$910 million), and the Netherlands (\$491 million).

Direct investments in the United States grew during 1955 at an annual rate of \$300 million. As in past years, about half of this growth was from reinvested earnings, the other half from the investment of new foreign capital.

FOREIGN POLICY OF THE UNITED STATES. The major issue of foreign policy during the year 1955 concerned the relative importance of substantive problems and of the spirit in which their solution is sought. If international tensions develop because the prejudices of peoples and governments lead to distorted interpretations of the policies of other states, thus making it impossible to solve controversies, then a change in spirit might dispel these prejudices and distortions and rapidly relieve tensions. But, on the other hand, if tensions develop because of conflicts of tangible national interests, then a new spirit would have permanent effect only if it altered national interests.

The issue was reflected in the contrast of the optimistic conviction frequently expressed by President Dwight D. Eisenhower, that the new

JUSTUS IN THE MINNEAPOLIS STAR

"ERA OF GOOD FEELING"

spirit—manifested particularly at the "Summit Conference" of the Big Four heads of government at Geneva in July (see GENEVA CONFERENCE)—could have important results, with the note of warning usually expressed by Secretary of State John Foster Dulles, to the effect that such hopes might be dashed and might result in a dangerous disillusionment of the public.

The "New Spirit."—On March 16, 1955, after the suicidal character of H-bomb warfare had become obvious, while the United States and the world were still disturbed over the threat of war in the controversy over Matsu, Quemoy, and other small islands off the China coast, and when the Bandung Conference of Asian and African states was in immediate prospect, 17 freshmen congressmen demanded a revitalized foreign policy which would put some political, social, economic and spiritual flesh on the bare bones of current United States military measures against communism. It was suggested that both political parties had attributed the world's ills too exclusively to Soviet aggressiveness, resulting in a negative policy of frustrating Soviet ambitions; and that the United States should give positive, vigorous support to policies aimed at peace, anti-colonialism, and economic development of backward areas.

President Eisenhower emphasized this "new spirit" in agreeing to meet the heads of the governments of Great Britain, France, and the Soviet Union in Geneva. In a message from his sickbed in Denver on October 26, to the Big Four foreign ministers meeting in Geneva, the president said that the Summit Conference of July "was designed to create a new spirit that will make possible future solutions of the problems which are within our responsibilities." At the same time, skeptics pointed out that "every substantive issue of the cold war remains as it was before Geneva." And indeed President Eisenhower recognized that "the acid test of the new spirit would come when the foreign ministers would, in accordance with our Geneva directives, tackle concretely those problems for which our nations have responsibility and which, if unresolved, create tension and danger."

Further evidence of the "new spirit" could be found in the more positive foreign policy leadership by President Eisenhower. With the eclipse of McCarthyism and the support of newly elected Democrats in Congress, the president was able to lead a majority of both parties in a bipartisan policy based on American principles. As he suggested in a news conference of Dec. 2, 1954, and repeated in his State of the Union message of Jan. 6, 1955, such a policy would emphasize conciliation without appeasement, and defense without provocation, and would be based on awareness of the close relationship of individual freedom, national independence, and international interdependence. In this spirit, the president, though he urged a congressional resolution in January 1955 for defense of Formosa and related islands, vetoed resort to hostilities when the Formosa Straits crisis became serious in April 1955, and suggested negotiation for a cease fire in that area.

Evidence of a new spirit in the Soviet Union was first observed in the moderation of language in speeches made by Prime Minister Georgi Malenkov after the death of Stalin in March 1953. A conciliatory tone also was exhibited by his successor, Nikolai Bulganin, in the winter of 1955; by the head of the Communist Party, Nikita Khrushchev; and by the foreign minister, Vyacheslav Molotov, as well as by such tangible acts as the restoration of the military base on the Porkkala Peninsula to Finland in September, the signature of a state treaty with Austria on May 15, the agreement of September 13 to exchange diplomatic officers with West Germany, the subsequent return of some prisoners of war to Germany, the opening of peace negotiations with Japan on June 1, and the modification of earlier stands on disarmament inspection, generating more hope of agreement in this field than at any time since 1947. Hope that this new spirit would continue was moderated after the failure of the Geneva foreign ministers meeting in November; the Soviet toleration of arms aid to Egypt by Czechoslovakia; anti-Western speeches by Soviet leaders visiting India, Burma, and Afghanistan; and the Soviet veto of Japan's admission to the United Nations.

Communist China also manifested some slight change in spirit, as seen in the more moderate speeches made by Premier Chou En-lai at the Asian-African Conference held at Bandung in April 1955; in its releasing some of the imprisoned American fliers following a visit to Peking in January by U.N. Secretary General Dag Hammarskjöld, as required by a resolution of the Ninth General Assembly in 1954; in its negotiating for the release of other imprisoned Americans with the United States (represented by Alexis Johnson) at Geneva in the fall of 1955; and in the relaxing of its belligerent threats concerning the Straits of Formosa.

A new spirit in the world was further emphasized in the speeches made in June 1955 at San Francisco celebrating the 10th anniversary of the founding of the United Nations, and in the declarations and discussions at the meeting of the Big Four in Geneva in July. This new spirit generated by statesmen was transmitted to peoples. Expectations of peace, perhaps buttressed by the general feeling that war with hydrogen bombs would be so obviously suicidal that no one would be willing to start it, transformed the "cold war" into at least a "cold peace." Whether coexistence in cold peace could, in time, develop a warmer atmosphere depended on progress in the solution

of many issues which required tangible settlement.

The Problem of Divided Countries.—Foremost among these issues was the reunification of four countries that remained divided. Korea, cut in two by the armistice line of 1953, remained disturbed, with reports of violations of the terms of the armistice from both sides, and occasional belligerent statements from the president of South Korea, Syngman Rhee.

Viet-Nam, divided between Communist Ho Chi Minh in the north and nationalist Ngo Dinh Diem in the south, was scheduled by an agreement of the Geneva Conference of 1954 (to which the United States had refused to subscribe) for unification by plebiscite in 1956. In October 1955, Diem, whose popularity appeared to have increased, declared his country a republic, thus eliminating Bao Dai, the chief of state who had long been resident in France. France and the United States acquiesced, and speculation continued as to whether the proposed plebiscite would be held, and if so, what would be its results.

China also remained divided. The mainland, with its population of nearly 600 million, continued under effective control of the Communist government of Mao Tse-tung in Peking, which was recognized by Great Britain, India, the Soviet Union, and 23 other states. The small offshore islands of Matsu and Quemoy, and the larger islands of Formosa and the Pescadores, with a population of some 9 million, continued under the control of Chiang Kai-shek, still recognized as the legal government of China by the United States and some 50 other states. In January 1955 President Eisenhower discussed the possibility of settling the problem of China by recognizing the existence of "two Chinas," but the United States, while negotiating informally with representatives of the Peking government for the return of imprisoned Americans, refused to recognize that government formally, and succeeded in preventing consideration by the Tenth U.N. General Assembly of its admittance as representative of China in the United Nations. The prospect of such admittance was advanced when the Nationalist government, representing China in the Security Council, vetoed the admission of Outer Mongolia, resulting in a Soviet veto of the admission of Japan.

Germany, too, remained divided. The Soviet Union, which had long recognized the Communist government of East Germany at Berlin, during the year recognized also the Adenauer government of West Germany. The United States and its North Atlantic Treaty Organization (NATO) allies recognized the Adenauer government of the German Federal Republic, insisted that it was the only government which could speak for Germany, and that reunion of the two halves could be brought about only by elections under fair conditions. This issue, combined with that of general security arrangements for Europe, was discussed at the Geneva Summit Conference in July 1955 and at the foreign ministers meeting at Geneva in October and November 1955. The United States and its allies insisted that German unification was a prerequisite to general European security arrangements, while the Soviet government insisted that the latter should come first, and that reunion was primarily a problem for the two German governments to settle between themselves. As a result, the conference adjourned without agreement on any of the three points on its agenda—European secu-

ity and German unification, disarmament, and development of contacts between East and West.

The Problem of Underdeveloped Areas.—Apart from the cold war issues manifested in the four divided countries, American policy was concerned with problems arising from the relations between the underdeveloped areas of Asia and Africa and the industrialized nations of the West. American policy continued to waver on the issues of national self-determination and colonialism. Desiring to placate its NATO allies, it voted in the Tenth U.N. General Assembly (September 1955) to keep the problems of Algeria and Cyprus off the agenda, though professing general sympathy for the anticolonial attitudes of the peoples of Asia and Africa. This issue was emphasized at the Asian-African Conference (q.v.) at Bandung in April 1955.

Other Areas of Tension.—Other areas of tension in the world manifested little progress toward settlement. The India-Pakistan controversy over Kashmir remained unchanged. The tension between Israel and its Arab neighbors was intensified because of a number of border incidents and the sale of arms to Egypt by Czechoslovakia in the autumn of 1955. Soviet and Egyptian opposition to the mutual defense alliance among Pakistan, Iran, Iraq, Turkey, and Great Britain, completed during the year with United States support (but not participation), may have contributed to this tension. The problem of the Saar, which it was hoped would be solved by the formula of Europeanization as agreed to by Germany and France at Paris on Oct. 23, 1954, again became an issue when the people of that area rejected this solution in a plebiscite on Oct. 23, 1955. In these matters, United States policy was that of preserving peace through negotiated settlements by the parties or through the mediation of the United Nations.

Disarmament and "Atoms for Peace."—It was hoped that the new spirit might facilitate progress on some of the more general topics of international interest. Disarmament negotiation continued in the United Nations and was stimulated by Soviet recognition that inspection in some form must accompany disarmament. American policy was indicated by President Eisenhower's suggestion at the Geneva Conference that the powers exchange armament blueprints and permit inspection from the air, with the prime object of assuring advance warning of mobilizations and thus preventing surprise attacks. Such inspection was asserted to have been proposed as a condition of eventual extensive armament limitation. The sequence of first limitation of use, then limitation of manufacture, and finally reduction of stockpiles, was suggested, especially with reference to atomic weapons, each stage being accompanied by appropriate and adequate international inspection. The Soviet Union emphasized withdrawal from advanced bases in foreign territory, and pointed to its own withdrawal from the base which it had occupied at nearby Porkkala, Finland. At the Geneva meeting of the Big Four foreign ministers in the autumn, Soviet Foreign Minister Molotov attacked the Eisenhower proposals (November 10) as inadequate, and said that the USSR would consider the inspection plan only as part of a more comprehensive plan for arms reduction and the prohibition of atomic weapons.

The most important item on the agenda of the Tenth U.N. General Assembly, which opened in New York on September 20, was the Atoms for Peace project initiated by President Eisen-

WIDE WORLD

Charles Bohlen, U.S. Ambassador to USSR, consults with Secretary of State Dulles (l.) and President Eisenhower (r.), July 18, 1955, during "Summit Conference" at Geneva.

hower in December 1953. The United States and other major producers of fissionable materials and the raw materials for their manufacture proposed an atomic energy agency dominated by themselves and loosely related to the United Nations as a specialized agency. The underdeveloped countries who hoped to benefit by the extensive use of this new source of energy, led by India, demanded more representation in the agency and a more integrated relationship with the United Nations. The United States modified its initial stand and agreed on Oct. 19, 1955, that a world conference should be called, to include 84 countries which are members either of the United Nations or one of its specialized agencies, to negotiate the statute for the atomic energy agency. (See also ATOMIC ENERGY.)

Foreign Economic Policy.—The liberal foreign economic policy, supported by the administration on the basis of the 1954 report of the Commission on Foreign Economic Policy, headed by Clarence Randall, was advanced when Congress passed a reciprocal trade bill on June 15, 1955 incorporating many features of this plan. The Reciprocal Trade Agreements Act was continued for three years, and authorization was given to reduce tariffs on different articles from 15 to 50 per cent during that period (see TARIFFS). Congress did not, however, endorse the Organization for Trade Cooperation (OTC) agreement signed by the government, but proposed to initiate hearings on this subject early in 1956.

The United States reduced its technical assistance program for the fiscal year 1956, and the Foreign Operations Administration was replaced by the International Cooperation Administration (see FOREIGN AID PROGRAMS, U.S.). American assistance tended to emphasize military rather than economic aid, although the United States continued to contribute to the U.N. Expanded Technical Assistance Program. The United States also sponsored an International Finance Corporation (q.v.) to assist in economic development.

Administrative Matters.—In the internal administration of foreign affairs an interesting departure was the appointment on March 19, 1955, of Harold Stassen as special assistant to the president on disarmament problems. The low morale of the Department of State appeared to improve

during the year—according to some because of the relaxation of congressional and other security investigations, and according to others because the department had been thoroughly purged by these investigations. The controversial Bricker amendment, to limit the treaty-making power of the president, was defeated in the Senate in 1954 but was reintroduced by Sen. John W. Bricker in 1955; new hearings were held, but no action was taken during the year.

FOREIGN TRADE. See INTERNATIONAL TRADE; the Index entries, *International Trade and Tariffs*; and articles on the individual countries.

FORESTRY. The 84th Congress enacted several laws pertaining to forests and forestry during its first session in 1955. One of the most important, Public Law 167, amended the mining laws pertaining to claims on national forests and other public lands. This law was intended to prevent widespread abuses in the filing of mining claims. Many persons had used the mining laws to obtain use of public land for purposes other than mining. President Eisenhower, when he approved the act, referred to it as "one of the most important conservation measures affecting public lands that has been enacted in many years."

Another enactment, Public Law 46, authorized the execution of agreements between agencies of the United States and other agencies for mutual aid in forest fire control. It will make possible, among other things, agreements between United States and Canadian forestry agencies for mutual aid in the protection of forests near the international border.

Forest Service Golden Anniversary.—The U.S. Forest Service in 1955 observed its 50th anniversary. The Forest Service came into being in 1905 through a merging of the forest reserves division of the General Land Office with the Bureau of Forestry of the Department of Agriculture. Management of forests for successive timber crops was an idea new to most Americans in 1905. In 1955, millions of acres, public and private, were being managed for a sustained yield of timber. The national forests in 1905 were largely undeveloped, remote, back-country areas;

in 50 years they have been developed into productive public properties which play an important part in the nation's economy. During the half-century, organized fire control was extended to most of the country's forest lands, millions of acres were reforested, and much important research in forestry was accomplished. The advances made in forestry were the result of efforts by many organizations and individuals, but the Forest Service could be credited with a leading part in the forestry progress recorded over the half-century.

National Forests.—Receipts from timber sales, grazing fees, and other uses of the national forests in the fiscal year 1955 amounted to \$81,137,294. This was an increase of more than \$12 million over 1954 receipts, reflecting mainly an increase in volume of timber sales. Timber harvested from the national forests totaled 6.3 billion board feet, a new record high and an increase of nearly 1 billion over 1954.

The net area of the national forests, as of June 30, 1954, was 181,057,569 acres, including 160,282,121 acres in the continental United States and 20,775,448 acres in Alaska and Puerto Rico.

Several forest fires raged out of control in national forests of California in the late summer of 1955. Thousands of men were mobilized to fight the flames. The fires killed timber and destroyed watershed vegetation on many thousands of acres. Up to July 31, 1955, the Forest Service fought 4,771 fires in national forests throughout the United States. The total area burned was 154,860 acres, compared with 87,239 acres in the same seven-month period of 1954.

Canada.—An economic survey covering 162 farms in the Province of Ontario showed that woodland averaged 30 per cent of the area of each farm. The average woodlot was valued at \$1,437, and average annual income derived from it was estimated at \$500.

The Division of Forest Biology of the Ontario Department of Agriculture reported results of a study which indicated that outbreaks of spruce budworm in spruce-fir stands are associated with the maturing of the balsam fir. Mature or flowering balsam fir provides conditions favorable to the insect. The current budworm epidemic was a recurrence of a similar outbreak about 85 years earlier, which virtually wiped out mature balsam fir in affected areas. Young seedlings which were not affected have now grown to maturity.

The Forest Club of the University of British Columbia published a comprehensive *Forestry Handbook*, containing information on forest inventory and survey methods, fire control, tree identification, basic silvicultural systems, statistics on forest industries, and other data useful to practicing foresters. The Plywood Manufacturers Association of British Columbia published a *Technical Handbook for Engineers and Architects* dealing with plywood design data. (See also CANADA.)

International Forestry Developments.—The European Forestry Commission, at its seventh session in Geneva in November 1954, concurred in the establishment of a Joint Committee with the United Nations Economic Commission for Europe to foster international collaboration in improving working techniques and training in logging and other forest operations. It also drafted outlines for an investigation into the status of farm woodlands and small forest properties, and into means of increasing their productivity.

WIDE WORLD

paper industry was held in Buenos Aires late in 1954. Nearly 200 experts from 14 Latin American and 10 other countries participated. The conference gave special attention to technical and economic aspects of manufacturing pulp and paper from tropical and subtropical woods.

The eighth session of the International Poplar Commission was held in Madrid, April 25-28, 1955. The third session of the International Chestnut Commission was held in Rome, September 19-25. A Joint Subcommission on Mediterranean Forestry Problems met in Athens, June 1-5. The third session of the Forestry Commission for Asia and the Pacific, under auspices of the U.N. Food and Agriculture Organization, was held in Tokyo, April 9-21. The Turkish government was host at Istanbul to a seminar on forest policy for Middle Eastern countries. The fifth session of the Latin American Forestry Commission of FAO was held in Caracas, Venezuela, October 4-15.

In Bolivia, a governmental Forest Service was created by law in 1954. It will be responsible for carrying out a national inventory of forests; creation of forest reserves; technical and economic control of forest extraction, afforestation, and reforestation; protection of wildlife; and control of hunting.

A law passed in Brazil provided certain tax exemptions to encourage the care of forests and afforestation of uncultivated land.

Amendments to the Forestry Code of Greece gave the minister of agriculture authority to require forest landowners having more than 8,000 hectares, or with annual output exceeding 4,000 cubic meters of industrial wood, to employ a trained forester.

In the Netherlands, a *Boschchap* (Forestry Board) was established by royal decree in 1954. The board has legal powers to enact decrees regulating forest enterprises. It also has control of the state forests.

Data from a national survey published in Finland showed the country's total forest area to be 21.8 million hectares, of which 17.3 million hectares were classified as productive.

The new building of the Forest Research and Experiment Institute, near Madrid, Spain, was dedicated by the chief of state, Generalissimo Franco, on Nov. 2, 1954. In Chile, the Llanacura Forest Research and Training Center was inaugurated on Feb. 11, 1955. (See also LUMBER; PUBLIC LANDS.)

FORMOSA (TAIWAN). An island about 110 miles off China's southeast coast, forming (with adjacent islands) Taiwan Province of China, and constituting the present seat of the Republic of China (Nationalist). Area, 13,885 square miles (including the Pescadores); pop. (est. Dec. 31, 1954) 8,749,000, of whom nearly two million are recent refugees from mainland China. About 177,000 primitive aborigines inhabit the mountainous area. Chief cities and populations (January 1954): Taipei, the capital, 630,949; Kaohsiung, a major port, 318,659; Tainan, 253,343; and Taichung, 226,025.

The Pescadores (Penghu) archipelago comprises 64 islands (total area: 49 square miles; est. pop., 83,600) lying about 30 miles off the west coast of Formosa in the Formosa Strait. Chief industries are fishing, fish processing, and cultivation of sugar, corn, fruit, and peanuts.

UNITED PRESS

Nationalist Chinese evacuate Tachen Islands off Chinese coast in February 1955, ahead of Communist occupation.

Government.—The government of the Republic of China is based on the Chinese Constitution of 1947, under which the executive, legislative, judicial, control, and examination functions are each exercised by a Yuan, or council. Chiang Kai-shek was re-elected president of the republic by the National Assembly on March 22, 1954. O. K. Yui was named premier (president of the Executive Yuan) in May 1954. Although the Legislative Yuan meets twice yearly, effective power is concentrated in the executive. The Kuomintang exercises virtual one-party rule. The provincial government of Taiwan is headed by a governor (C. K. Yen, appointed May 1954), who is named by the central government's Executive Yuan. There is also a 21-member Provincial Council and a 55-member Provisional Provincial Assembly chosen by municipal and local councils.

The Chinese Nationalist armed forces are reported to total 600,000, equipped with the aid of the United States and trained under the supervision of the U.S. Military Assistance Advisory Group commanded (since July 1955) by Maj. Gen. George W. Smythe. The U.S. Seventh Fleet has patrolled the surrounding waters since 1950 to prevent Chinese Communist seizure of Formosa. Since the spring of 1955, Air Task Force 13, under the U.S. Pacific Command, has operated out of Formosan bases, with headquarters at Taipei.

Finance.—For the fiscal year 1954-55, the estimated budget totaled NT\$2,875 million. The basic official selling rate of the New Taiwan dollar is NT\$15.65 = U.S. \$1.00. In March 1955, regulations came into effect rendering the effective official dollar rate for most imports at NT\$24.78; and for exports, NT\$21.55. Between 1951 and mid-1955, the United States provided Nationalist China with over U.S.\$534 million in aid, not including arms and munitions.

Education.—Education is free and compulsory for children between the ages of six and 12. Primary schools in 1953 had 1,060,324 pupils; 133 secondary schools had 106,306; 81 vocational schools, 45,601; and National Taiwan University, 4,287. There are also schools for public administration, technology, and agriculture.

Production.—Since the adoption of the Four-Year Plan (1953-56), industrial production has risen considerably, with United States aid playing an important role. Spindles installed in the cotton textile industry numbered 181,844 in November 1954 (10,000 in 1945), and output of cotton yarn amounted to 125,880 bales in 1954 (107,464 in 1953). Electric power capacity aggregated 391,914 kw. at the end of 1954 (33,000 at the end of World War II), and production of electric power in 1954 totaled 1,805 million kw.-hr., a rise of 15.4% over 1953. Output of cement in 1954 totaled 536,416 metric tons (a rise of 3%); coal, 2,117,603 (a decline of 11.5%); and chemical fertilizers, 167,961 (a rise of 2.4%). Other important industries are foodstuffs, petroleum products, paper and pulp, chemicals, aluminum, copper, sulfur, and salt. Overall industrial output rose an estimated 6.4% in 1954.

Land reform measures completed in 1954 bestowed 242,000 hectares of farmland (27% of

total farm area) upon 383,000 former tenants (55% of total farm households), resulting in increased output and improved rural living conditions. Irrigation and increased supplies of chemical fertilizers have also contributed to rising output. Production of foodstuffs in 1954 slightly exceeded the yield of 1953. Output of rice totaled a record 1,696,452 metric tons in 1954; sweet potatoes, 2.32 million; and sugar (raw value, 1953-54), 722,084. Other important crops are groundnuts, soybeans, bananas, pineapples, citrus fruits, tea, jute, tobacco, sesame, vegetables, and wheat. Fisheries production in 1954 totaled 152,548 metric tons.

Foreign Trade.—Exports in 1954 totaled U.S. \$97.8 million (a decline of 24% from 1953); imports, U.S. \$110.2 million (excluding United States aid imports). The decline in exports was due to the surplus of rice in world markets and limitations on Formosan sugar exports imposed by the International Sugar Agreement. Sugar accounted for about 60% of the value of 1954 exports. Chemical fertilizers, ores, metals, and metal manufactures were the chief imports. Japan took 54% of Formosa's 1954 exports and provided 56% of purchased imports.

Transportation and Communications.—The two railroads under the Taiwan Railway Administration aggregated 590 miles in 1954; additional trackage is operated privately by the Taiwan Sugar Corporation. In mid-1954 there were 9,688 miles of provincial, county, and rural roads. Five airlines provide service between Taipei and other Far East centers. The merchant fleet totaled 354,000 registered tons in 1954; passenger cars numbered 3,277; trucks and buses, 6,750; and telephones, 38,188 (1955). Formosa had 19 daily newspapers in 1952, with a total circulation of 222,000.

M. J. G.

THE YEAR 1955 IN FORMOSA

The Chinese Nationalist government in Formosa was confronted with a grave situation at the beginning of 1955, when war clouds darkened over the Formosa Strait. The mutual defense treaty concluded between the United States and Nationalist China on Dec. 2, 1954, provided for common action against armed attack on Formosa, the Pescadores, and "other territories as may be determined by mutual agreement." Taking advantage of the uncertain attitude of the American government toward the offshore islands, the Chinese Communists on Jan. 18, 1955, captured Yikiang Island, a Nationalist outpost off the Chekiang coast. After that, the Tachen Islands, 7½ miles southeast of Yikiang, were exposed to attack. On February 7, on the advice of the United States government and with the assistance of the U.S. Seventh Fleet, the Nationalists evacuated the Tachens.

The next objectives of Communist invasion were believed to be Quemoy and Matsu, the two island groups off the Fukien coast. The United States government refused to commit itself to the defense of these islands, although it did not exclude joining battle if an attack on these islands appeared to be a preliminary to the invasion of Formosa.* The Nationalist government was disappointed, but resolutely declared in February and March that Quemoy and Matsu would be defended with or without American

aid. (See also FOREIGN POLICY OF THE U.S.; UNITED STATES—*The United States in 1955*.)

The Nationalist government was opposed to any discussion of a cease-fire with the Chinese Communists. When the U.N. Security Council on Jan. 31, 1955, invited Communist China to send a representative to participate in the discussion of a cease-fire proposal, President Chiang Kai-shek declared that a cease-fire arrangement with the Communists would be "tantamount to recognition of the *fait accompli* of the aggressors." He condemned the idea of "two Chinas," which had been circulating in the United States and other countries.

When U.S. Secretary of State John Foster Dulles declared on July 26 that the United States was willing to negotiate with Communist China for a cease-fire without Nationalist participation, the immediate public reaction in Formosa was one of anger and bitterness. Although the United States government assured Formosa that the talks between the American and Chinese Communist ambassadors at Geneva, beginning August 1, would not affect the interests of Nationalist China, the Nationalist government watched the talks with grave concern. The Nationalists were opposed to any investigation of Chinese students in America by a third power in order to ascertain whether they wished to return to mainland China. The Nationalists also voiced strong objection to the lifting of the trade embargo against Communist China.

The authorization of American aid to Nationalist China for the fiscal year 1956 amounted to \$102,000,000. Of this amount, 47% would be used for military purposes. This aid made possible the maintenance, expansion, and modernization of the Nationalist defense establishment. The problem of age, once the Nationalist army's weakness, was being overcome through the retirement of older soldiers and the recruitment of young men in Formosa.

The year 1955 saw progress in the economic field, especially the improvement of Formosa's productive capacity and the raising of the general standard of living. Electric power capacity had grown to 392,000 kw. early in 1955. Fertilizer plants were being built throughout the island in order to end Formosa's dependence on fertilizer imports. Nineteen of 31 major industries registered overfulfillment of production targets for the first half of 1955, and the year's industrial output index had reached 790 (1946=100).

The Joint Commission on Rural Reconstruction helped increase food production by effectively carrying out a program which aimed at higher crop yields, livestock improvement, and rural welfare promotion. The land reform program, under which landlords have been forced to sell their excess land to the government at a reasonable price (the land in turn being sold to the farmers), contributed greatly to the development of rural economy. According to a government report in September 1955, farmers' individual income had increased 75% over that of 1948. The annual production of rice in Formosa had increased from 894,000 metric tons in 1946 to an all-time high of 1,696,452 metric tons in 1954.

The construction of a great, multipurpose dam at Shihmen, about 30 miles southeast of Taipei, was started in July 1955. Financed with the aid of a United States loan, the project, costing about \$36,400,000, was to be completed within five years. The dam is expected to result in the irrigation of 136,500 acres, to provide a peak electric power capacity of 12,000 kw., and

* A congressional resolution passed Jan. 28, 1955, and signed by the president the following day, gave the president discretionary authority to employ United States forces to defend Formosa and the Pescadores.

to serve as a major flood-control measure in northern Formosa.

In spite of general economic progress, Formosa was not without its difficulties in 1955. The expansion of military establishments caused a serious drain on Formosa's resources. Dependence on United States aid and an increasing birth rate were also unfavorable economic factors. In an address in May 1955, Premier O. K. Yui recognized that "it will not be possible to achieve self-sufficiency in the near future."

CHESTER C. TAN,

Lecturer in Public Affairs and Regional Studies, New York University.

FOUNDATIONS AND TRUSTS. See names of organizations under SOCIETIES AND ORGANIZATIONS.

FRANCE. Metropolitan (continental) France has an area of 212,736 square miles, which includes various small coastal islands and the island of Corsica (3,367 square miles). The Saar (q.v.) remains linked economically to France. France is a member of the United Nations, the North Atlantic Treaty Organization (NATO), and various European organizations (see EUROPEAN ORGANIZATIONS).

The French Union.—France, through the French Union, which was established by the Constitution of the Fourth Republic (1946), controls the second largest colonial empire in the world. It has an aggregate area of 4,596,905 square miles and an estimated population of 84,854,000.

On Aug. 5, 1955, the French National Assembly approved an administrative decision whereby the Adélie Coast in Antarctica and the Crozet, Kerguelen, St. Paul, and Amsterdam islands in the southern Indian Ocean ceased to be dependencies of Madagascar and were given an autonomous status within the French Union. Henceforth these territories will be grouped under the Southern and Antarctic Lands Administration, which will have its own budget and be represented by a Consultative Council attached to the Ministry of Overseas Territories.

Outside of metropolitan France there are 4 departments (a new department of Bône was established in

1955) in Algeria and 4 overseas departments. On Sept. 25, 1955, Cambodia deleted from its constitution references to membership in the French Union, but its status, as well as that of the other states of Indochina, remains to be clarified. (For events in the various parts of the French Union see articles on the territories listed in the accompanying table.)

Population.—According to the census of May 10, 1954, metropolitan France had a population of 42,774,445, to which should be added 38,000 persons who were not at their legal residence at the time the census was taken, and 187,000 military and civil personnel residing temporarily outside the country. Included in the total, however, were 1,451,752 foreigners. There were 63 cities with a population of more than 50,000 and 24 with over 100,000. Paris, the capital, had a population of 2,850,189; Marseille, 661,492; Lyon, 471,270; Toulouse, 268,863; Bordeaux, 257,946; Nice, 244,360; Nantes, 222,790; and Strasbourg, 200,921.

Government.—The Constitution of 1946 provides for a president elected by Parliament for a 7-year term. On Jan. 16, 1954, René Coty, an Independent Republican, took office as the successor of Vincent Auriol, a Socialist.

Executive power actually rests in the premier and cabinet, who are responsible to the National Assembly. On Feb. 5, 1955, Premier Pierre Mendès-France resigned after failing to get a vote of confidence on his North African policy (see below, *Principal Events*, 1955). Premier Edgar Faure's right-wing government received parliamentary approval on February 23. Key men in the new cabinet were Antoine Pinay (foreign affairs), Robert Schuman (justice), Pierre Pfimlin (finance), and Gen. Pierre Koenig (defense).*

The Council of the Republic (upper chamber) is primarily a consultative body; it consists of 320 members elected indirectly by electoral colleges for 6-year terms in the departments of metropolitan France (249, including 3 representatives of French citizens abroad), Algeria (14), Martinique (2), Guadeloupe (2), Réunion (2), French Guiana (1), and other overseas territories (50). The last partial election took place on June 19, 1955, when election of half the membership produced no significant changes.

The National Assembly (lower chamber) is elected by universal secret suffrage, and under a law of May 23, 1951, consists of 544 deputies from metropolitan France, 30 from the departments of Algeria, 10 from the other overseas departments, and 43 from the overseas territories, making a total of 627. The deputies are elected for a term of 5 years. Regular elections were held on June 17, 1951, and new elections were held on Jan. 2, 1956 (see below, *Principal Events*, 1955).

There is also an advisory Economic Council of 169 members drawn from labor, agricultural, industrial, and commercial organizations.

Party allegiance is not hard and fast in Parliament, and similar groups do not always bear the same name in both chambers. Listings of party alignments are therefore likely to show some variation according to the method of grouping small parties and the shifting of allegiances from time to time. The composition of the assembly and the council in 1955 was as shown in the table at the top of page 276.

Metropolitan France is divided into 90 departments, 311 arrondissements, 3,031 cantons, and 38,000 communes. Each department is headed by a prefect, assisted by an elected departmental council. Council elections were held in 1,511 cantons on April 17 and 24, 1955,

* Since the Constitution of the Fourth Republic went into effect, France has had the following premiers (dates show National Assembly approval of the cabinet, not investiture of the premier): Paul Ramadier (Jan. 22, 1947—Nov. 19, 1947); Robert Schuman (Nov. 22, 1947—July 19, 1948); André Marie (July 24, 1948—Aug. 27, 1948); Robert Schuman (Aug. 31, 1948—Sept. 7, 1948); Henri Queuille (Sept. 10, 1948—Oct. 6, 1949); Georges Bidault (Oct. 28, 1949—June 24, 1950); René Pleven (July 13, 1950—Feb. 28, 1951); Henri Queuille (March 13, 1951—July 10, 1951); René Pleven (Aug. 11, 1951—Jan. 7, 1952); Edgar Faure (Jan. 22, 1952—Feb. 29, 1952); Antoine Pinay (March 11, 1952—Dec. 23, 1952); René Mayer (Jan. 8, 1953—May 21, 1953); Joseph Laniel (June 30, 1953—June 12, 1954); Pierre Mendès-France (June 24, 1954—Feb. 5, 1955); Edgar Faure (Feb. 23, 1955—Nov. 29, 1955).
